Emunctology Reference Manual

For the Clinical Practice of Emunctology Having The Full Understanding of The Workings of The Body in Health and Dis-ease

"If This Theory Be True, It Upsets All Other Theories." *- "Richmond Whig Newspaper", 1870's*

"Even as the Son of man, came not to be ministered unto; But to Minister, and to give His Life a ransom for many." *- Matthew 20:28*

"Let no corrupt communication proceed out of your mouth, but that which is Good to the Use of Edifying, That it may Minister Grace unto the Hearers." *- Ephesians 4:29*

"I will publish the name of the LORD; ascribe ye greatness unto our God. He is the Rock, His work is perfect; for all His ways are judgement; a God of Truth and without iniquity, just and right is He." *- Deuteronomy 32:3-4*

The Lord Thy God

"I AM the Light of the World;
he that followeth Me
shall not walk in darkness,
but shall have the Light of Life." *- John 8:12*

Here, Light is Shed, Upon These Well Established Therapeutic Means;
In which, one may Give Proper Care to the seeker;
And this is the ultimate Aim of All Emunctology Teachings

His Promise

"Come and know ye Me, and I will give thee that knowledge that thou hadst with me since the foundations of the world." *- Isaiah 40:21*

"Before the world was, I AM! Now if ye abide in me and I in the Father, then I will bring to thy remembrance All Things from the foundations of the world!" *- John 14:26*

"If ye shall ask any thing in my name, I will do it." *- John 14*

"For, To him that loves Me will I, and the Father come,
and We will abide with him; directing him in the choices made in his dealings
with his fellow man day by day." *- John 14:17*

"Be not afraid, for I will not Leave thee comfortless.
If I go not away the Comforter will not come, but when he comes
He will abide with thee always" - *John 14:18*

"If ye will obey My voice indeed, and keep My covenant,
then ye shall be a peculiar treasure unto Me; above all people;
for all the earth is Mine; And ye shall be unto Me a Kingdom of Priests,
and an Holy Nation." *- Exodus 19:5-6*

"I will Instruct thee, and Teach thee, in the Way which thou shalt go:
I will Guide thee with Mine Eye." *- Psalms 32:8*

"The Lord Opened My Eyes, so that I could See." *- Emanuel Swedenborg, in "The Life and Mission of Emanuel Swedenborg", 1901.*

The Circle with the Cross
These make for the Sign that;
All thou hast heard is Fulfilled in Him

Hospitallers Order of the Good News

The Lord He Is God

Trust in Him who Is the Way

"LORD, my strength, and my redeemer." - Psalms 19:14

Keep thy faith in Him, that All will be and is right!
Be mindful in thy going ins and coming outs.
Be True to that Thou Knowest, and be sure the
Foundation is in Him. And make thy life
Thy activities in accord with same!

"My son, attend to my words; incline thine ear unto my sayings. Let them not depart from thine eyes; keep them in the midst of thine heart. For they are life unto those that find them, and health to all their flesh." *- Proverbs 4:20-22*

"They that are whole have no need of the physician, but they that are sick:
I came not to call the righteous, but sinners to repentance." - Mark 2:17

Whereby the quoted material is justified, and no more than is necessary is included. The source of the quoted material is mentioned, along with the name of the author. The Order is making such material available in our efforts to advance understanding of scientific issues. We believe this constitutes a 'fair use' of any such copyrighted material as provided for in section 107 of the US Copyright Law. In accordance with Title 17 U.S.C. Section 107. All proceedings from the book goes to charity. The Civil and Military Hospitallers Order of the Good News; through its Publications; with the purpose, to be of helpfulness to others. **Without Him to lead, and the Team to help, this and all other Books, that have been published by the Order, could have not been written, in a speedy way, that they have been. For the task at hand, is enormous, and the days and nights, I have denied myself, this in and for the benefit of others. For the help, of he who is in need of it. And also that man may know that He, indeed, is mindful of each one of you. Seek Him, and Glorify Him, for He Is Thy God and Saviour. The wisdom it is not mine; It Is Of The LORD. True godly wisdom is not earthly; nor self-derived, but from the Lord. It is pure; rather than relying on human intellect or pride. Wisdom is available to those who ask the LORD, Thy GOD and SAVIOUR; for it; in faith.**

May The Good News Pass From One to Another

"What can they do, without: *"The Sword of the Spirit, which is the Word of God."*

When we speak to them of God, as the great Creator of everything they see, and the Father of all, they say: *"That was what we were longing to know."*

But to know that they were children of this Great Universal Parent, and that He cared for them more tenderly, and individually, than they did for their own children, this gave them spirit to work on in hope, and to cast their care on One who, they now knew, cared for them. Then, when we speak of Jesus; and His life of love, and toil for them, and His painful death, their hearts respond to the thought of His loving, ever-present sympathy.

When we speak of the work of the Spirit, they will say:

> *"We wonder how we could have lived so long without them. For the first time in our lives our hearts are satisfied; some inward craving, which has kept us restless and dissatisfied, is stilled; we seem to have drunk from some life-giving fountain, and our thirst is quenched."*

All this, they have learned from the Teaching contained in these Manuscripts.

> *"We carry them away with us with heavy hearts, with a feeling as if we were leaving hungry people without bread. We long for the time when there shall be enough for every one."*

Then John Wycliffe would tell them that this had been the thought upon his mind for years past, that indeed every interval of leisure during his life had been employed either in the preparation for, or the actual translation of the Scriptures into English, and for the last 10 years it had been the main object of his life. "See", said he, pointing to a table in his quiet study, covered with manuscripts, commentaries, dictionaries, every thing in short, helpful for this work:

> *"It is there that I sit, not only by day, but often far into the night. Just a few lines only will sometimes cost me hours, and days of study before I can satisfy myself as to the correct rendering, but by God's help, I hope never to relinquish my task until I have succeeded in giving the people the whole of the Scriptures in their own tongue."*

To have the whole of that precious book, in a language understood by the common people, lit up a hope in their hearts of the dawn of brighter days. To know that the Bible could be obtained, would induce many more to learn to read, and in this way they hoped the Good News might pass from one to another." - in "Long Evenings And Work to Do in Them", 1874.

In Gratitude To

This Book is dedicated to the following:

To the God of Abraham "I AM that I AM": Who Is The God of Humankind, Our One and Only Lord and Saviour The Christ. We Dedicate this Book: To All Those Who Have Perished at the hands of ignorant men of The Medical Trade; To all those Wise Men who understood the difference between what is Right and what is Wrong; To those Wise Ones, Who Are Ever Present, And Let Not Civilization Fall.

> ***“For the Next Coming of Christ; there is a Band of People who, to welcome Him, should be able to Transcend their Physical Natures, and Realise their Spirituality.”*** *- Dr Edward Bach, MD, in “Writings”, 1933.*

> ***“Prepare ye the way of the Lord.”*** *- Isaiah 40:3*

Where Does Wisdom Come From

Know Who Is the Author of thy Wisdom. In Whom have ye believed? For he that would be the greatest must be the servant of all. First must the body find itself, and make its relations correct with the Creator. First must he Learn that: The Beginning of Wisdom; Is The Understanding And Knowledge of the Father.

For As one uses that one knows, the awareness of its source, of its ability, of its end, is more and more a part of the soul. For to do good is to be absent from that which will cause, Ever or at any time, confusion in self or in others.

> ***“Raise your gaze, have faith, and you will know, that Wisdom is not acquired through clandestine investigations, as man does with man. It Is Acquired by Conversing With God.”*** *- Benjamín Solari Parravicini*

The Dimensions and Facets of Reality

“The world that is perceptible to our senses, and the world of our concepts and beliefs is certainly a part of reality. But the separation it is so tiny as to barely be a blip on the screen. Unless what is called the real world, is placed in the proper context and perspective, it is no more than a dream.

A Dream: Spiritual Experiences help us to loosen our grip on the materialistic view of reality as the dominant one. They help us to soften and expand the boundaries of who we think we are.

We must each find the Connection with Reality through our Own Investigation of Self, Mind, and Reality: The Physical, Mental, and Spiritual.

1. Consciousness is the First Cause of the Universal Manifestation, a Creative Vibration whose echo is the manifest cosmos. Life itself is the Creative Force or God, yet its manifestations in man are Electrical, or Vibratory.

2. This Creative Consciousness Is The Animating Life Force Of All Living Creatures, it Permeates Every Atom of the Entire Cosmos. Realising this, our fundamental experience of life shifts from Dualistic to Unitive, from doing to non-doing, from becoming to being.

3. We are, in our essence, overflowing with presence, intuition and joy; Overflowing with presence, intuition, and joy is who we are.

4. Everything Is Sentient (has the ability to experience feelings and sensations), all things are alive and conscious, regardless of how inanimate they seem to our gross eye. Everything is a vibration of the primal consciousness, apparent differences being differences of frequency.

5. All Living Things Are Related. If you touch Here; you touch There. This is the root of the maxim: “What Goes Around, Comes Around.” The categorical distinctions we use to separate ourselves from others and the world are hallucinations, which prevent us from seeing that we are the world, and the world is us.

6. The individual self does not exist. It’s not that we don’t exist; we just don’t exist as independent of everything else, and we don’t exist solely within the package of our body/mind. On the one hand, we feel that we are the story, and history of our body/mind; on the other hand, we have all experienced how love, beauty, and joy exist only when we transcend that story. Our individuality is a barrier to the deepest and truest experience of being alive, in which we lose and forget ourselves.

7. We Live In Multiple Dimensions: And have access to powers, capabilities, and knowledge beyond the range of motion of our body, senses, and mind. The Human mind, can directly access the entire database of consciousness, and demonstrate massive intuition, clairvoyance, precognition, energetic healing, bilocation.

8. Every Thought and Action: Is a potent seed which bursts into the world, sooner or later. We cannot easily sort out the intricate and complex web of cause and consequence, seed and flower. Nonetheless, every rooster comes home to roost. If we kill, we should expect to be killed. If we degrade, pollute, and spoil, we should expect that, look for that. If we deprive others, we will soon be deprived. If we show kindness and generosity to others, watch it return. We live on a wheel and we turn that wheel with our thoughts and actions.

9. Life Is Eternal, the manifestations of life are impermanent: Everything exists in its own cycle of birth, growth, decay, and death. Everything, from a thought to a mayfly to a galaxy. With the subtle eye, we see that there is no solidity at all, there is only an incredible festival of energy. Solidity and duration are conventions of our perceptual faculties. Now is the truest expression of Reality.

10. Attachment Is Suffering: Let everything go as quickly as it comes. All of our ideas, identities, thoughts, opinions, grudges, unresolved expressions, motives, wounds, angers, fears, hopes, dreams, loyalties; create the individual self, which is the barrier to experiencing the essential sell.

11. The ideas of original sin are fear and shame. And may be defined in one word: Disobedience.

12. Thoughts and Awareness: Are distinct forms of Perception. Thinking is a limited form of perception and cannot experience reality directly. Awareness is without inherent limitation; awareness is the experience of reality.

13. The Mystical Experience is a wild sea in which wave upon wave of depth and significance crash over us; layers, facets, and dimensions of the great mystery open and befriend us.

The mysticism I know is simple: it is the Silence that Falls Upon Us, in a Moment of Beauty, of Creation, of Love, of Communion, of Deep Reflection." - in "Invisible Leadership: Igniting the Soul at Work", 1998.

> ***"The Punishment of Every Disordered Mind Is Its Own Disorder. The Mind Commands the Body, and is instantly obeyed. The Mind Commands Itself, And Meets Resistance."*** *- Augustine of Hippo, in "Confessions", AD 397.*

What Is Truth?
And Why Does It Matter?

> ***"Is Truth not the basis, On Which We Judge Reality. Coexist Peacefully, Justly! Power of the Minority, Over a Majority with a Foundation Based on Lies, will lead to ruin. Healing and Unity cannot be achieved when this is the case, only division the people. In Establishment Media, the tool most often used to manipulate, and control the public, the most insidious tool, is not the outright lies they pedal, it is the lying by omission that is most effective. It is the mechanism that chains the minds of people. It is Plato's Cave manifested, and those who escape these bonds, have a mountainous task in revealing the truth to those who still remain in that cave."*** *- in "What Remains: Exposing the Kamloops Mass Grave Deception's Impact on Powell River", 7 May 2025.*

The Truth: The Essential, and Highest Value of Mankind

> ***"From the Whole Deduction Which Has Now Been Made, it appears that superstition is useless; that Truth and Reason, are alone to be depended on in giving a regular and safe determination to human actions; and that the Idea of Managing Mankind by Means of Prejudices, and by Arts of Deception Is False Philosophy, as Unwise, as It Is Immoral."*** *- Dr Thomas Hardy, in "The progress of the Christian religion", Society in Scotland for Propagating Christian Knowledge, 30 May 1793.*

The Pursuit of Truth

> ***"The Pursuit of Truth, hath been my only care, ever since I first understood the meaning of the word. For this I have forsaken all hopes, all friends, all desires, which might bias me, and hinder me from driving right at what I aimed. For this I have spent my money, my means, my youth, my age, and all I have, that I might remove from myself that censure of Tertullian: "Suo vitio quis quid ignorat" (Who is ignorant is his own fault). If with all this cost and pains, my purchase is but error, I may safely say, to err has cost me more than it has many to find the truth: and truth itself shall give me this testimony at last, that if I have missed of her, it is not my fault, but my misfortune."*** *- John Hales, in his letter to Archbishop Laud, 1721.*

> ***"So [Easy To Understand] Are All Truths, when once they are found out, but the Difficulty Lyeth In Finding Them."*** *- Galileo Galilei, in "Dialogue Concerning the Two Chief World Systems", 1632.*

"In the first place, circumstances have occurred which have greatly raised in importance the consequences of inquiry, and of course the consequences of the conduct exhibited in prosecuting it.

So long as Science and Civilisation had no existence, as mankind were solely occupied with providing for their physical wants, or were continually engaged in the rougher work of mutual depredation and hostility, **the cultivation of knowledge as a separate sphere of exertion, and indeed any semblance of regular investigation even in practical concerns, would be almost unknown, and consequently the virtues and vices connected with the pursuit of truth, would not be called forth.**

Gradually, however, as civilisation advanced, as the interests of society growing more complicated required more careful discrimination, as wealth and the exemption from occupation accompanying wealth became diffused, and curiosity was at leisure **to speculate on the nature and destiny of man, and other beings, to investigate surrounding objects, and to scrutinise passing events, it became manifest that the results of this mental activity would have important bearings on the fortunes of mankind.**

What we term inquiry must always have place, and possess importance in a certain degree, inasmuch as it is mixed up with ordinary conduct; but it is not so immediately apparent that, when pushed beyond the point of direct applicability, it has an extensive influence on human affairs.

In the second place, concurrently with this change produced by the growing importance of the pursuit of truth, and of all conduct connected with it, the moral sentiments of mankind on the subject have also undergone progressive alteration from a more and more accurate appreciation of the tendencies of human actions, and a nicer discrimination of complicated moral phenomena.

A retrospect of the three last centuries alone, leads us to anticipate that any improvement in the discrimination of good and evil in the various paths of human life must eventually find its way from the meditative few to the less reflecting many. Amongst these few, in the present day, the fundamental principles, without which a code of morality in reference to the pursuit of truth cannot exist, are universally held.

Philosophers unite in **regarding Truth as inseparably allied with human happiness, and error as essentially hostile to it.**

Duties of the Inquirer in relation to the State of his own Mind, No one who has been accustomed to discriminate the phenomena of the world within him can doubt hat **there are certain states of mind favourable to success in the pursuit of truth, while there are others of an opposite character.**

Duties Towards Others in Relation to the Pursuit of Truth

While it is our duty to enter upon the investigation of certain subjects, and conduct the inquiry with diligence and impartiality, we may be called upon by various circumstances to exercise an influence over our fellow-men who lie under the same obligations, or who have voluntarily undertaken the pursuit of truth in some department of knowledge. There appear to be 2 principal methods in which this may be rightly done. The first is by advising and encouraging others to undertake and prosecute inquiry in the proper spirit and manner, and manifesting our sentiments of their conduct in these respects; the second is by communicating to them the information we possess, the facts and inferences which have presented themselves to our own minds, and thus helping them to their ultimate object; the attainment of truth.

The 1st may be briefly designated as Moral Influence;

The 2nd as Intellectual Assistance: the one supplying motives to search for truth, the other means for succeeding in the pursuit.

The 2nd way of influencing others in the pursuit of truth is by the communication of knowledge; by instruction.

It must frequently happen that a man who has satisfied his own mind on some particular subject, shall be imperatively called upon to assist others whose duty it is to make a similar investigation, by imparting such information as he has himself acquired respecting it.

Above all, he would be encouraged in the pursuit of truth by the prospect that his efforts would be of service; that any communication he might make to his fellow creatures in a right spirit could do them no harm, and might confer lasting benefit. The state of society at present on this great subject, it is not too harsh to say, is a state of barbarism.

Whoever looks abroad must admit, that in the most enlightened countries existing in the world, gross ignorance of the duties of man to God, and of man to man, in relation to the pursuit of truth, abounds.” - in **“Essays on the Pursuit of Truth and on the Progress of Knowledge”**, 1844.

The Cure of Disease

> ***"The Health of the People Is Really The Foundation upon which all their Happiness and all their Powers as a State Depend."*** *- Benjamin Disraeli, British Prime Minister, in Speech, 24 July 1877.*

"To Advocate a Purely Hygienic System of Cure, or the Simple Practical Application of the Vital Truths of Physiology; to the end that the Restorative Energies of the Organism May Be placed in the Best Condition, and have the fullest scope, for their own development, thus Converting Diseased Into Healthy Action.

It Being Clearly Established that The Natural Tendency of the Body Is To Rectify Its Own Deviations, when placed in the best circumstances for so doing.

Such was the Natural Common-Sense-Like, and Effective Agency with which the illustrious Sydenham Combated the Disease.

By Such Means the Justly Celebrated Currie was Cured in his own person, When Deemed Incurable By The Ordinary Practice.

By This Agency Dr Combe long bade defiance to the ravages of consumption.

Such in Effect Was the Plan Relied on by the fathers of ancient physic, by Hippocrates, by Celsus and Aretæus; and, in comparatively modern times, by Salvadori in Italy; by his contemporary Gilchrist in Edinburgh; by Portal in Paris; and by Dr Stewart of Erskine; All The Most Successful Curers of Consumption (Tuberculosis) in Their Own Times.

The Water Cure of the present day, in honest and scientific hands, and freed of all adventitious and ad captandum accessories, is this strictly Hygienic or Physiologic System of Treatment.

The time has fortunately passed away for it to seek the false aid of puff or advertisement, or to require the doubtful advocacy of "confessions" and "testimonials."

It is now as much above the need of exaggeration as it is beyond the reach of detraction. Standing on its own naked merits, it can afford to dispense with glowing pictures of its "safety and efficacy", or of the marvellous doings of "establishments in full operation."

It requires no paid writers to defend its cause; its own best practitioners holding rank, in point of education and accomplishment, with the first men in the profession, and being quite competent to fight their own battle.

The Duty a Man Owes to Himself, when he assumes the function of a Teacher of Truth that concerns the general well-being of others, is to be grave, earnest and truthful; to appeal only to the sober thought of the thinking community, and to deliver himself of the true convictions of his mind, no matter what prejudices they offend what practices they contradict, what interests they thwart.

In conclusion, the writer has aimed at giving a perspicuous, comprehensive, and practical exposition of the Nature, Causes, Prevention, and Cure.

Having a deep conviction of the justness of the views propounded, and of the superiority of the practice inculcated, the author has urged their claims with a corresponding earnestness.

If the Practice Be Faulty, It May Be Corrected; but if Both Be Found Based On Truth, that Many May Co-Operate In Applying Them For The Benefit of Suffering Humanity Everywhere." - Dr John Balbirnie, MD, in "The Water-Cure in Consumption and Scrofula; an Exposition of the Question of Their Curability", 1854.

> ***"Peter said that: There Are No Diseases; But Only Patients. This Is True.***
> ***Ottomar Rosenbach wrote:***
>
> ***"We Wish Not To Classify; But To Cure"."*** *- in "The Nominalistic Conception of Nosographical Entities "Diseases"," Proceedings of the Royal Society of Medicine, 1938.*

> ***"All Scientific work is liable to be upset, or modified by advancing knowledge.***
> ***That does not confer on us a freedom to ignore the Knowledge We Already Have, or Postpone the Action that it appears to demand at a given time."*** *- Sir Austin Bradford Hill, in "The Environment and Disease: Association or Causation", Proceedings of the Royal Society of Medicine, 1965.*

Emunctology Reference Manual

> ***"As A Clinical Guide, It Is Written for the Benefit of the Practising Clinician In Order To Satisfy 2 needs:***
>
> ***1. That of the Clinician for a Deeper Approach to Healing.***
> ***2. That of the Seeker for a Deeper Experience of Healing."*** *- in "The Theory of Endobiogeny", 2019.*

The Study of the Extraordinary Function of the Human Body

"Research on the Extraordinary Function of the Human Body Are of Great Importance; both Theoretical and Practical.

We Firmly Believe that: There Is Nothing that Cannot Be Understood in the world; There Are Only Things that Have Not Yet Been Understood.

We are full of confidence, as to the prospect of: The Study of the Extraordinary Function of the Human Body." - in "Study of the Extraordinary Function of the Human Body", Space Medico-Engineering Institute [China Astronaut Research and Training Center], 1983.

Then, these notions, these selection of words, of phrases, are here given to present a Truth, not the illusion of truth, but the Truth which is Eternal. To know the Truth is to make you free. For he that findeth the Truth is free indeed. Truth is as Life, a Growing consciousness in self. All which is here included in this Book, was selected, to be an aid to the material mind, To Understand the Natural Unseen Forces, Which Command All That Is Living.

> ***"Man, His Body Is a Playground of Many Forces Still Unknown, Though Nevertheless Very Real."*** *- Dr Maryla de Chrapowicki, D.Psy, in "Biotonic Therapy;* ***The therapeutic use of Life Energy, and the Effect of Light and Colour Vibrations on Life****", 1952.*

It Is Impossible for the Material Mind to Comprehend the Spiritual Realm, for there is both lack of words, of vocabulary to express something which is Unseen. Al-dough felt, and sometimes even Sensed or Perceived, but Not Quite Understood. There is much wisdom in this pages, for this Book, like all the Books of the Order, where written to be of Help, to Aid the Seeking Humankind. And to fulfil that promise by Him:

> ***"Seek, and ye shall find; knock, and it shall be opened unto you."*** *- Matthew 7:7*

Thus, Emunctology is that which is helpful, and pertains to the welfare of Both the Souls, and Bodies of individuals. Let the Ideal of the Christ Guide thee. For He hath given His promise:

> ***"Take my yoke upon you, and Learn of me."*** *- Matthew 11:29*

In This Knowledge of Him, thy Saviour, as thy companion, the way becomes easy, the burden becomes light. For as He hath given, take not thought or fret thyself not concerning tomorrow, looking not back but ever upward, onward, into the face, into the love of the Christ. And ye will find His presence giving thee strength for the daily conditions, the daily disturbances. And He will keep thee as in the hollow of His hand. For as He hath given, He hath given His angels charge concerning thee, but the Christ has given: "I, even I, will be With thee." Then trust in Him, for this is indeed Knowledge.

> ***"And chiefly thou, O Spirit, that dost prefer Before all temples th' upright heart and pure, Instruct me, for thou knowest; thou from the first Wast present, and, with mighty wings outspread, Dove-like satest brooding on the vast Abyss, And madest it pregnant; what in me is dark Illumine, what is low raise and support. That, to the height of this great argument, I may assert Eternal Providence, And justify the ways of God to men."*** *- John Milton, in "Paradise Lost", 1667.*

The Sum of Knowledge Concerning the Laws of Health

> ***"This Book is one which should make a strong appeal to the younger practitioners, whose medical scholastic training of 4 years supplemented by 2 years at least of interneship, Has Lacked A Coherent, individualized course in the all-important, everyday, Rational Work of Taking Good Care of their Bodies, And Preserving Their Health. Each chapter has a sort of "Golden Text", or so-called "Law" of Health as a beginning. The Chapters have the same Law as a Text. The concluding chapter, instead of illustrating any special Law has for a Motto:***
>
> ***"Do Unto Others As Ye Would That They Should Do Unto You."*** *- Matthew 7:12*
>
> ***Which is applicable enough for its subject, Eugenics. No new theories, facts or opinions are given But: The Sum of Knowledge Concerning the Laws of Health, and How to Keep Well Are Presented, In Clear, Unmistakable Language, In An Attractive And Convincing Manner. The Book Is Sure To Make Friends For Itself."*** *- in "New England Journal of Medicine", 29 August 1935.*
>
> ***"As Spiritual Healers We See Visions of Truth that mere materialism cannot see; we use remedies, too, that others cannot use; but we miss one inexorable truth; the spirit of man is subject to the law of substance in this life; Spirit and Body Are Inter-Dependent, Vibrant, One To The Other, Until The End. As Mental Healers we have discovered One Great Truth: Ideas Profoundly Influence The Body's Health. As physicians, too, we often see the body empty, without a spirit, even without a mind; mere chemist, physicist, hand-worker; we see mere physical realities and ignore all others; dismiss them into the region of the unreal and the impractical. But surely, in the coming years; A Race of Healers Will Arise To Wonder At Us; Whole Men, Integral Men, Men of Healing Integrity; Men Able to See All That Is To Be Seen; All the Mystery and all the Promise of Unknown Truth; all the Secrets of the Spirit of Man, and All the Marvels of Mere Matter."*** *- Dr Herbert Carleton Sawyer, MD in "The Matter with Nervousness, 1909.*

Emunctology Is Based Upon the Clinical Evidence of Facts; obtained from the direct Clinical Experience of All Practitioners here mentioned, giving thus, their Testimony, and sharing their Clinical Observations. Together with the Book "Emunctology", this unselfishly written Book; whose scope and utility, is so nearly commensurate with the too apparent present needs of Humanity. Was written to be: Sound, Sensible & Practical; a perusal of this Book, thorough the Application of its Principles; will place Health & Hope, in the Hearts of Millions of Lives.

The Emunctology Teachings, Best Given by Illustrations, to Enforce the Truths for the Great Ameliorating Influence of Health

“Playfair's position in the world of science can, in the nature of things, only be determined when sufficient time has been allowed to elapse to bring him, and his contemporaries in scientific work into their true focus.

Throughout his career his **chief object seemed to be to bring all the stores of knowledge which he had at his command, all the teachings of experience, to the service of his fellow-men.** The reader will obtain the best idea of the extent of Playfair's knowledge, and of the peculiar place which he occupied in the world of science, from the book “Subjects of Social Welfare”, 1889.

The subjects dealt with are various, ranging from the Public Health, and the Phenomena of Sleep, to Bimetallism, and the Relations of the Universities to Professional Education. Playfair's labours as a man of science; and the tribute which he pays to the part that Playfair had in **bringing science and statesmanship, science and industry, into close and practical alliance, will be endorsed by all men of science and all practical workers.**

Playfair's mode of work, furnishes a model for all engaged in similar inquiries. It occupied many years of Playfair's life; all the time he could spare from his regular avocations being devoted to it. Sir Edward Frankland, declares that for **plan of procedure, scientific accuracy, and thoroughness of execution,** Playfair's reports on **this investigation will bear favourable comparison** with any ever presented to Parliament by command of Her Majesty.

He never forgot his first love; and whenever he had the opportunity, he strove to impress upon those with whom he was brought in contact the virtues of science as a great ameliorating influence of life, and its uses in the development of the resources of a people, and in the removal of the evils to which society is a prey. His style, both in speaking and in writing, was at once delightfully simple and delightfully picturesque.

The illustrations by which he sought to enforce the truths he was teaching were drawn from the commonest objects, and were made effective by the ingenuity with which they were applied to the subject in hand.

In turning over the pages of “Subjects of Social Welfare”, I find many passages illustrating his peculiar method in dealing with abstruse questions, and the remarkable ability with which he was able to make complex problems intelligible to the ordinary mind.

I find also in the book some of those master-strokes which made Playfair one of the great practical teachers and pioneers of our time.

Other men dug more deeply into the soil in search of abstract truth, but he had at least a wonderful knack of laying his hands upon the nuggets in the mine in which others wrought, and of bringing them to the light of day.” - in “Memoirs and Correspondence of Lyon Playfair, first lord Playfair of St. Andrews”, 1899.

"One of the essential qualities of the clinician is interest in humanity, for the secret of the care of the patient is in caring for the patient. Disease in man is never exactly the same as disease in an experimental animal, for in man the disease at once affects and is affected by what we call the emotional life. Thus, the physician who attempts to take care of a patient while he neglects this factor is as unscientific as the investigator who neglects to control all the conditions that may affect his experiment." *- Dr Frances Peabody, MD, in "The Care of the Patient", to students at the Harvard Medical School, 21 October 1926.*

To Lay The Foundation For Those Who Are To Come And Point The Way

"I work for the future; Build for the future. Just as today I see the realization of experiments carried on 50 years ago, I am working with a view toward still greater achievements which will come to pass a half century hence. That is my method. After experiencing a desire to invent a certain thing, I go on for days, months, even years with the idea in the back of my head. Whenever I feel like it, I play around with the problem without giving it any deliberate consideration. This is the incubation period: Next comes the stage of direct effort. At this point the solution is somewhere in my Subconscious Mind, although it may take some time before it reaches e Level of Consciousness. As my Conceived Device begins to take form, I make mental changes in the construction, improvements are figured out, and I even operate it. All of this is preliminary work all in my Mind. When the machine itself is finished, I slip my imaginary job over it and find they coincide to the minutest detail. My paramount desire today, which guides me in everything I do, is an ambition to Harness the Forces of Nature for the Service of Mankind. As I see it, we are on the Threshold of a Gigantic Revolution based on the commercialization of the wireless transmission of power. The principles for this have been discovered by me. As this Wireless Energy is converted into a commodity for the use of the masses, transport and transmission will be subjected to tremendous changes. Motion pictures will be flashed across limitless spaces by my system. The same energy will drive airplanes and dirigibles from one central base. In this New Era man will be able to travel safely, and at great speed, to any part of the world; the jungle; the arctic; the desert; mountain tops; over oceans. The instruments by which these wonders will be achieved will be amazingly simple. These things will come to pass. The scientific man does not aim at an immediate result. He does not expect that his advanced ideas will be readily taken up. His work is like that of the planter: For the future. His Duty is to Lay the Foundation for Those Who Are To Come, and Point The Way. He lives and labours and hopes." - Nikola Tesla, in "Modern Mechanix and Inventions", July 1934.

Truth Matters

"Then the band and the captain and officers of the Jews took Jesus, and bound him." - John 18:12 **"He sought to win men by His life of love; but vainly. And so He offered no hindrance, when the hour was come,** because this was that for which He had come, after love in life, through love in death, to conquer. **He offered His own hands for the binding; the hands that for 3 weary years had been stretched out to a disobedient and gainsaying people.** Like the mighty Judge of Israel, He could without effort have snapped the cords that held Him. He would not. **These His enemies, in their ignorant vanity, thinking themselves the victors, were but fulfilling His blessed will, and forwarding His design of ransoming a sin: Accursed World. They who, led by a thief, and soon to choose a thief, had come out against a Saviour, as against a thief, to take Him, were ignorantly the ministers of His, to do His service, binding the sacrifice with cords, by whose death the world was to have life.** His non-resistance had for its motive this very fact; His will was in process of accomplishment. **And this truth, suggests another intimately related to it, and readily gathered from the binding of Christ by His enemies: The Permitted Triumph of Evil Is Temporary. It is the Spirit of the cross that we need. Out of the possession and exercise of that Spirit will issue results in blessing richer than we have power to imagine. What happens to me matters little; but What Happens To The Truth Matters Much."** - in "The Bound Christ Triumphant", The Homiletic Review, August 1885.

Nature Is Our Friend: Not Our Enemy

"All things in nature have a shape, that is to say, a form, an outward semblance, that tells us what they are, that distinguishes them from ourselves and from each other. Unfailingly in nature these shapes express the inner life, the native quality, of the animal, tree, bird, fish, that they present to us; they are so characteristic, so recognizable, that we say, simply, it is "natural" it should be so. Yet the moment we peer beneath this surface of things, the moment we look through the tranquil reflection of ourselves and the clouds above us, down into the clear, fluent, unfathomable depths of nature, how startling is the silence of it, how amazing the flow of life, how absorbing the mystery! Unceasingly the essence of things is taking shape in the matter of things, and this unspeakable process we call birth and growth. Awhile the spirit and the matter fade away together, and it is this that we call decadence, death. These two happenings seem joined and interdependent, blended into one like a bubble and its iridescence, and they seem borne along upon a slowly moving air. This air is wonderful past all understanding. Yet to the steadfast eye of one standing upon the shore of things, looking chiefly and most lovingly upon that side on which the sun shines and that we feel joyously to be life, the heart is ever gladdened by the beauty, the exquisite spontaneity, with which life seeks and takes on its forms in an accord perfectly responsive to its needs. It seems ever as though the life and the form were absolutely one and inseparable, so adequate is the sense

of fulfilment. Whether it be the sweeping eagle in his flight, or the open apple-blossom, the toiling work-horse, the blithe swan, the branching oak, the winding stream at its base, the drifting clouds, over all the coursing sun, form ever follows function, and this is the law. Where function does not change, form does not change. The granite rocks, the ever-brooding hills, remain for ages; the lightning lives, comes into shape, and dies, in a twinkling. It is the pervading law of all things organic and inorganic, of all things physical and metaphysical, of all things human and all things superhuman, of all true manifestations of the head, of the heart, of the soul, that the life is recognisable in its expression, that form ever follows function. This is the law. Shall we, then, daily violate this law in our art? Are we so decadent, so imbecile, so utterly weak of eyesight, that we cannot perceive this truth so simple, so very simple? Is it indeed a truth so transparent that we see through it but do not see it? Is it really, then, a very marvellous thing, or is it rather so commonplace, so everyday, so near a thing to us, that we cannot perceive that the shape, form, outward expression, design, or whatever we may choose, of the tall office building should in the very nature of things follow the functions of the building, and that where the function does not change, the form is not to change? We know, and feel that: Nature Is Our Friend, not our implacable enemy." - Louis H. Sullivan, in "The Tall Office Building Artistically Considered", Lippincott's Magazine, March 1896.

"The Lord He is God"

Has in the Oneness of the Living God the Christ Our Lord and Saviours, so it is in the oneness of comprehension and understanding in which those points of truth these Authors all conclude and agree upon. And as a result on which they all agree, that point of agreement, that truth universal truth, that this book finds its essence and it is thus produced and given as a testimony that:

"The Lord He Is God", and the Lord walks with us everyday, even if you do not see Him, He Is with us, He Is with those who ask for Him for The Lord Is God of All Humankind. These are not vain words, but are those words from those who know The Lord, His Ways, His Coming. And many others whose names do not appear here but they know who they are.

> ***"And Asa in the thirty and ninth year of his reign was diseased in his feet, until his disease was exceeding great; yet in his disease he sought not to the Lord, but to the physicians."*** *- 2 Chronicles 16:12*

For these writers, spoke not in vain, but in Truth. The Lord in His mercy sought fit to that these Truths; be not forgotten; but be of true benefit for he who seeks. To all physicians, whose convictions regarding the soundness of principles set forth in this work, and whose fearless advocacy of therapy based upon these same principles; have been a constant source of encouragement and inspiration to many, this book is also dedicated.

Acknowledgements

The collective knowledge, generated from academic research summarized in various references has been critical in the creation of this published work, which is best viewed as a comprehensive compilation and collection of published information by Many Authors throughout the ages, as well as personal and clinical experience in the treatment of self and others.

> ***"True research is the careful elimination of untruths, and the amalgamation of truths. Valuable accomplishments are thus made by the concerted efforts of many."*** *- in "The Southern Surgeon", August 1937.*

This work was possible only by the guidance and Light of Christ who Is God. A special thanks also to those who work with Him and help all of us. May each individual be able, to find this eternal truth, while on earth.

Credits and References

Although all credits and references where given to the best of our knowledge and information contained in the central archives of the Hospitallers Order of the Good News. If there is any errors or mistakes we kindly ask the reader to allow the knowledge of such items in order to rectify same in future editions of the present Book.

Health and Therapeutic Journals and Books

The present work rests upon the foundations of those civilization luminaries, men and woman of exceptional talent, intuition, and detailed observation. Furthermore it was a privilege to us, for them to have the dedication and time to write and publish their clinical findings. There is then a vast amount of Journals and Books devoted to the Health and Therapeutics. **Of These Printed Records those from 1850 to 1950 in this one hundred year period we specially encounter that The Majority of what is to be known concerning disease its origin and its Treatment and Cure, where in fact Correctly Identified. These records, in their collective, contain timeless observations of which many remain Permanent Truths. These pearls are hidden from plain sight, only the Adept or the Initiated can identify them and pick one by one, from the surrounding confusion. This was the work done, are the result of same are the books published by the Order.**

Sources

This book is a Record of the clinical findings of many great Health Practitioners, their findings remain the same throughout the centuries. All share the same conclusion. The Truth is in plain site. Apart from the Archives of the Hospitallers Order of the Good News Library, we are also very grateful to all libraries, who have kept books for the last 200 years, those of which by their keeping allowed the information on those books to survive, and be upon their withdrawn from their keeping available to purchase by the Order, and kept in its Archives and Library. The Hospitallers Order of the Good News, has therefore obtained many of this rare Books, many of which are not available, nor found in the libraries, for this we thank The Lord who Is God, for having placed the same in keeping of the Order.

Errors & Omissions

Although the editor, publisher have made every effort to ensure that the information in this book was correct at press time, the editor, publisher do not assume and hereby disclaim any liability to any party, for any loss, damage, or disruption caused by errors or omissions, whether such errors or omissions result from negligence, accident, or any other cause. Much care was taken to avoid any errors or omissions, if any do exist, please let us know, in order to correct same in any future editions.

Dedication

"To the victims, past and present, rich and poor, of Adulterated Food, Patent Medicines, Compulsory Vaccination, Abuse of Surgery, booze-guzzling, industrial diseases, autocracy of dress, false modesty, sex ignorance, and conventional hypocrisy; to those, who never had a real opportunity to learn the truth, being kept in ignorance through the vicarious and popular channels of misinformation. To those, whose nerves, muscles, bones, marrow, and blood have been converted into dollars and cents under, the iron heel of commercial greed, in the name of health, science, and benevolence; to those, whose inner and better selves remain crushed and stifled as a result of monotonous, loveless lives, tyrannical and fanatic parents, and uninspiring surroundings in general; to the patient "sons of toil," who constantly undermine their health and risk their lives, making it possible for us to appreciate art, music, literature, culture, and invention that the genius of human brain has brought forth, yet have for themselves little in return, save fatigue, malnutrition, soul-starvation, anxiety, fear, filth and premature death. To all these victims of our seething, restless, debauching, artificial, and health-wrecking era, impudently labelled "civilized". I affectionately and hopefully dedicate this book." - Dr Simon Louis Katzoff, MD, in "Timely Truths on Human Health", 1921.

"The present work is written for the double purpose of correcting error, and imparting truth. *Its purpose is not to attack men, nor systems, but simply to state facts by which their pretensions may be judged." - Dr Frederick Hollick, MD, in "Neuropathy, or The true principles of the art of healing the sick" 1847.*

Disclaimer

"The content of this Book is based on research conducted by the Members of the Hospitallers Order of the Good News, unless otherwise noted. The information is presented for educational purposes only and is not intended to diagnose or prescribe for any so-called "medical" or "psychological" "condition", nor to prevent, treat, mitigate or cure such "conditions".

The information contained herein is not intended to replace a one-on-one relationship with a qualified healthcare professional. Any advise for Healthcare should be sought upon those **OUTSIDE** of The Medical Trade, for **Medical Trade advise is totally different from Health Advise, for Health and Medicine are two different and totally opposite things. As for the "Science" of Medicine this so-called "Science" is aimed, mainly and foremost, at selling Poisonous Synthetic Pharmaceutical Products, maintaining the client under Medical Trade "treatment" and prescription from cradle to grave (from birth to death), and once the Nefast consequences of the actions of these Pharmaceutical Poisonous Synthetic Compounds effect a direct damage upon all organs of the body system, the Medical Trade then sells Surgeries, in order to remove the dead organ parts damaged by Medical Trade Pharmaceuticals. After studying the Medical Trade, we can only conclude: That one of the great wonders of the imagination of the Medical Trade; is that it is capable of Conceiving Every Form of Fallacy Directly Opposed to the Truth.** Emunctology is not "Medical Trade" advice (Emunctology is that directly opossed to the Medical Trade, that is the TRUTH, not Medical Trade Error; but the TRUTH, and only the TRUTH is accepted in Emunctology. For: Errors, Lies, Fallacies Has No Place in Emunctology. Emunctology does not seek to Force Nor Coerce Poisonous Vaccines nor Pharmaceutical so-called medications), Emunctology is the sharing of knowledge and information, **based on Practical Clinical Research and Experience.** The Hospitallers Order of the Good News encourages the reader to make your own Health Care decisions based on your judgement and research in partnership with a qualified Health Care Professional. These statements have not been evaluated by the both **Useless And Corrupt Food and Drug Administration**, in the USA. The information on this Book is not intended to diagnose, treat, cure, or prevent any disease."

> ***"In My Writing, As Much As I Could, I Tried To; Find The Good And Praise It." -*** *Alexander Palmer Haley*

> ***"The Physician knows that most something about Diseases, but nothing about Health.*** *If only because the latter is a scarce commodity throughout his life.* ***The Physician has no contact with normal healthy people, hence the frightening statistics about the amount of protein we need daily, invented by the brilliant Justus von Liebig, who experimented on a large number of German students, with huge beer bellies, miserable engines which needed 3 times as much fuel because of this dose of proteins determined from inept samples. For more than 30 years, it was administered for more than 30 years protein poisons, were administered throughout Europe to completely normal people, especially children thus spreading Acute Appendicitis, Gout, and other Metabolic Diseases. He who recognizes an evil is already half cured."*** *- Prentice Mulford, in the original manuscript of "Thoughts Are Things", 1889.*

> ***"There is no unity of thought, no congruity of conclusions, no agreement as to the proper means to be employed,*** *although there is, as far as outward appearances are concerned, an approximate* ***Oneness of Purpose."*** *- in "A Treatise on Medical Practice", 1916.*

As sad it may be, that one is forced to place such a disclaimer, just serves to illustrate the state where the present Civilization is at the moment. **A Civilization Founded On Lies Has No Future: A Civilization Based On False or Fake Pretences Has No Future; A Civilization That Follows Political Correctness Is Fake By Proxy. To sustain the present Civilization is to sustain a lie.**

Thus the solution is to establish a New Civilization, this if Humankind will ever have a chance to develop on Earth. The Study of the Emunctory System doesn't attract major research efforts, and it is all but abandoned to a profound neglect, by the Medical Trade. **The purpose of this book, is to create in one single volume, a collection of written experiences from physiologists, clinicians, physicians, surgeons, and radiologists who have spent most of their lives studying subjects that relate to the Emunctory System.**

Every text in this book was chosen for a reason, every idea and teaching that it conveys, has been found to be in truth, not in error, but in Truth, and many times this individuals where at odd with the Medical Trade, matters not what other say; **Our Trust is always in Christ, for He Is God.**

> ***"The Sufficiently Realized by Those in Authority. National Health Insurance Act 1928, practically speaking, Makes Provision for No Treatment Other Than by Drugs. Physiotherapists are often paternally warned that they must not claim that their specialities alone can effect cures in many different forms of disease. We therefore feel justified in asking the Insurance Act authorities whether their speciality, i.e., Drugs, is such a sovereign specific, that Every Other Method of Treatment May be Neglected. Put in this form, the question admits of only one answer. Yet it is a Plain Fact that Drug Treatment is practically the only form with which the Insurance Act concerns itself. How long is the present Human and Economic Wastage to continue before the Act is extended, to make provision for The Forms of Treatment Which All the Leading Authorities Recognize To Be The Only Satisfactory Means of Combating Rheumatic Affections, in other words: Treatment by Electrotherapy, Hydrotherapy, and other Physical Measures?"*** *- in "Insurance Act Reform", British Journal of Actinotherapy and Physiotherapy, September 1929.*

Is not the body composed 75% of Water? Is not the Spirit; that vivifies the Soul Electrical? The Spirit and Mind may build the flesh to beauty, to Health, even when racked with pain. And what be the Elements? Fire and Water! Thus Hydrotherapy, and Electrotherapy are those channels through which man should approach his Help to his Fellow Men.

“I ask the reader not to consider this little work in terms of the work itself, but in terms of the subject it deals with, a subject that is destined to render the greatest service to suffering humanity, as evidenced by the conduct of the most renowned physicians of all countries, who prescribe Hydrotherapy Treatment to their patients deemed incurable, as the Treatment that Offers them The Best Chance of a Speedy Recovery.” *- Dr H. Guérin, MD, in “Merveilleux effets de l'eau froide dans le traitement des maladies ou de l'Hydrothérapie”, 1863.*

“The main reason for the failure of modern medical science is that it is dealing with Results and not Causes. For many centuries the real nature of disease has been masked by materialism, and thus disease itself has been given every opportunity of extending its ravages, since it has not been attacked at its origin.” *- Dr Edward Bach MD, in “Heal Thyself: An Explanation of the Real Cause and Cure of Disease”, 1931.*

“Regarding the Teaching of Medical Sciences from a practical and professional point of view, Dr Aud'houi, MD explains very fair ideas, that we fully share: ‘To tell the truth, Professional Teaching of Medicine does not exist: it has never existed. We all leave School, extremely well-educated, I grant, but not knowing much about real Medicine: because there is nothing in common between the Science of Practical Medicine, and the routine which consists of identifying symptoms and lesions and addressing them, all the same, by a sort of unconscious, automatic and forced action, with some kind of Drugs.” *- Pro Dr Victor Aud'houi, MD, in “Introduction au Cours d'Hydrologie Médicale”, Revue Odontologique, January 1892.*

“There is no Wealth but Life. Life, including all its powers of Love, of Joy, and of Admiration. That country is the richest which nourishes the greatest number of noble and happy human beings; that man is richest who, having perfected the functions of his own life to the utmost, has also the widest helpful influence, both personal, and by means of his possessions, over the lives of others.” *- John Ruskin, in “Unto This Last”, 1860.*

“The vast majority of human knowledge in general, of every kind, always exists only on paper, in books, this paper memory of humanity. Only a small part of it is, at any given time, actually alive in any mind.” *- Arthur Schopenhauer, in “Parerga und Paralipomena”, 1874.*

“Prayer alone give us an understanding of Truth; but prayer, coupled with a fervent habitual desire to know and do the will of God, will bring us into all Truth.” *- Mary Baker Eddy, in “Science and Health with Key to the Scriptures”, 1875.*

This Book, along with all the Books, published by the Sovereign Civil and Military Hospitallers Order of the Good News, have been given, and made available, as to once again fulfil that promise of Him, that:

> *"Seek and ye shall find. Knock and it shall be opened unto you."* - *Matthew 7:7-8*

For indeed this Book is given, as to be of benefit to those to whom this Lessons of Truth (not error, but Truth), shall make for the better understanding, of the workings of the body, and to which tools, may be used, and thus to indicate; Which Tools are indeed Usefulness, and How may Each Therapeutic Method, be Correctly Used, in the Treatment of Each and Any Health Condition. For, Each Soul should ever Seek, and be directed to be under the Protection of the Christ Consciousness, in its Seeking for Information, or for Guidance, in Seeking for same, and Ever be Surrounded by that Consciousness.

For, much might be given, as to what man in his estate has gained, and as to how he has gained that knowledge of the seeking for the awareness.

Then, Study From All That Which Here Can Be Obtained, correlating same with that desire to show self acceptable unto Him, The Giver of all good and perfect gifts, making manifest in word, action and deed those lessons gathered; little by little, line upon line, giving them, for that is Service to All.

> ***"But when love to God is man's chief love, then he does not entertain for these objects any other kind of love than that of promoting thereby his love of God.***
> ***The Lord Himself will instruct me. For, as I discovered, I am in such a state that I know nothing on this subject except that Christ must be all in all, so that we of ourselves cannot contribute the least toward it, and still less strive for it: wherefore it is best to surrender at discretion, and were it possible to be altogether passive in this matter, it would be a state of perfection. I saw also in a vision how some beautiful bread was presented to me on a plate. This was a prediction that the Lord Himself will instruct me, as soon as I have attained that state in which I shall know nothing, and in which all my preconceived notions will be removed from me; which is the first state of learning: or in other words that I must first become a child, and that then I shall be able to be nurtured in knowledge, as is being done with me now.***
> ***May God lead me in the right way! Christ said that I must not undertake anything without Him!***
> ***The Word of the Old Testament contains arcana of heaven, and that all and each of the things therein regard the Lord, His heaven, the Church, faith, and the things which are of faith, no mortal apprehends from the letter; for from the letter or the sense of the letter no one sees anything else than that they regard in general the external things of the Jewish Church; when yet there are everywhere internal things which are nowhere manifest in the external, except a very few which the Lord revealed and explained to the Apostles; as, that sacrifices signify the Lord.***

In the following pages by the Lord is meant solely the Saviour of the world, Christ; and He is called Lord without the other names. He is acknowledged and adored as Lord in the entire heaven, because He has all power in the heavens and in the earth.

He commanded also saying:

"Ye call Me Lord, and ye say rightly, for I Am." - John 13: 13

And after the resurrection the disciples called Him Lord.

"Through the whole heaven they know no other Father than the Lord, because they are One, as He said:

"I Am the Way, the Truth, and the Life."

- Philip saith: "Show us the Father."
- Jesus saith to him: "Am I so long time with you, and yet hast thou not known Me, Philip? He that hath seen Me hath seen the Father: how sayest thou then, show us the Father? Believest thou not that I Am in the Father and the Father in Me?
Believe Me that I Am in the Father and the Father in Me" - John 14:6-11." *- Emanuel Swedenborg, in "Documents Concerning the Life and Character of Emanuel Swedenborg", 1877.*

"For in each step of my life I have actually felt, time and again, God's guidance. In each event of life how clear, Thy ruling hand I see, Each blessing to my soul, more dear Because conferred by Thee." *- Dr Lucius Duncan Bulkley, AM, MD, in "Ebenezer, I Samuel 7.12; notes on a busy life", 1925.*

"He that doeth truth cometh to the light, that his deeds may be made manifest, that they are wrought in God." *- John 3:21*

We are Eternal beings, souls trapped in a Three Dimension world. That which vivifies the physical man is the Living Spirt, which is of God, part of God.

"As Human Life, once caused to exist, can never cease, some other provision is necessary for its perpetual continuance. While living in the natural world, Man Is A Spiritual Being, having a material body temporarily adjoined, but not conjoined, as it is never part of himself. The Body receives its form and appearance from the Soul within, being, in fact, a simulacrum of the man himself and bearing the appearance of his personality and identity to others.

Man's real individual identity is established in his spirit, which is himself from first to last, the only change being that of state and spiritual growth, as his character is developed, while in all the changes nothing that has been once ultimated in his life is ever lost. The growth of the spirit, is therefore by accretion only, of those things that have been conjoined to him by being in agreement with his ruling love. **The adjoined material body, serves to keep man within the region of time and space during the term of his natural life. It is in a state of perpetual fluxation, being sustained by food which is assimilated, to replace every moment during natural life that which is rejected as effete. There, is thus a continual process of destruction and reconstruction going on under the guidance of the spirit, but subconsciously, by which it is maintained in a state of representative identity to the spirit within. In no other way can matter appear to live. Only at death do these fluxations cease, and then the material body is resolved into its elements. Being thus spiritual in a natural body, man is, at once, a denizen (admitted to residence) of both worlds; but consciously so in the external one only. He is, however, a recipient of mental impressions from both which constitute his thoughts. Some of these he perceives to arise from external associations, others come he knows not how or whence. The light is there, and will be acknowledged when the eye of the understanding shall be accustomed to its brilliance. The Lord in all His dealings with mankind, works with infinite wisdom and simplicity; and we shall find that the manner in which He reaches down to man is really alike in every case, in Creation, Redemption, and Revelation."** - in "A Spiritual Universe, The Corollary of a Natural One", The New Church Review, January 1909.

"The Power, of who designed the miracle of the human body, was not inept and likely to overlook provision, for its maintenance in health.

Are we to believe that God, created this wonder, with its infinite complexity of reaction, and left it at the mercy of the first, or any, hostile "germ" that happened to cross its path?

> ***"Blinded by "Science" The modern Medical System, to the extent of perhaps 80%, is nothing but a Gigantic, Cruel, Ludicrous, Lucrative, Transparent Fraud. Doctors do not know what disease is nor how it is brought about. They know little of the natural, and nothing at all of the spiritual provisions, either for maintaining or regaining good health. Disease is mostly a more or less gradual degenerative process, due, first, to failure to fulfil the requirements of well being; and, second, to conventional attempts at prevention and cure." - in "New Zealand's Greatest Doctor Ulric Williams, Sourgeon"***

Medical Trade Methods Don't Cure

Their subserviency encourages indolence of body and mind.

The whole tendency of the Medical Trade, is to create and perpetuate sickness, and make it attractive to those lacking, the moral qualities to live healthily. Along comes a medicine man, misinformed, as to the nature of these symptoms, and how they are caused, tears up, muffles the signals, silences the warnings; and so, while the danger still rushes upon him, he deludes the victim, into a false, and frequently, fatal sense of security.

Sir William Osler, the famous physician, teacher and diagnostician, once said:

> ***"We put Drugs about which we know little, into bodies about which we know less, to cure diseases about which we know nothing at all."*** *- Sir William Osler, Surgeon*

What An Admission!

Man exists out of all mental harmony, with the One Source of Life; he makes his body the repository of decaying flesh, mid denatured foods; he introduces into it poisons, in the form of drugs; he stuffs and gluts it with almost incredible quantities of rubbish got up to appeal to his senses; he no longer eats to live, He Lives To Eat; and the Temple (his body) is befouled, and its existence endangered in order that he may continue to gratify his perverted appetites.

> ***"Here is thy lesson; Hear ye all! Beware lest ye as an individual soul, a son, a daughter of God, fail in thy mission in the earth today; that those ye know, those ye contact shall know the truth of God, not by thy word, bombastic words, but in longsuffering, in patience, in harmony, that ye create in thine own lives, for it must begin with thee. God has shown thee the pattern, even one Jesus, who became the Christ that ye might have an advocate with the Father, for the Father hath said: In the day ye eat or use the knowledge for thine own aggrandizement, ye shall die." But he that had persuaded the spirit, the souls that God had brought into being, to push into matter to gratify desire for self-expression, self-indulgence, self-satisfaction, said: "Ye shall not surely die", or what were then the activities of man, for as had been said: "A day is a thousand years, a thousand years as a day." What was the length of life then? Nearly a thousand years. What is your life today? May it not be just as He had given, just as He indicated to those peoples, just as He did to the lawgiver, just as He did to David; first from a 1,000 years to a 120, then to 80? Why? The sin of man in his desire for self-gratification."*** *- in "The Book of Emmanuel or God among men; The Teachings of Him who had walked in Galilee: He that is thy Lord!"*

Symptoms Are of Dual Significance

Symptoms, are Nature's warnings of deflection from "the Law"; they are also evidence of Nature's method of cure. In either case, the more effectively we suppress them, without adequate attention to the underlying disease process and the causes that brought it about, the more effectually may we prevent Nature from achieving her beneficent purpose of protecting us." - Dr Ulric Williams, MD, in "Hints on Healthy Living", 1934.

> ***"Many a person want to be a writer. I Always Encourage Such People. In most cases these individuals are dreaming of wealth and fame, not the Long Hours Alone at the Typewriter. The Reality is that Writing Is a Lonely, Private and Poor-Paying Affair. For every writer kissed by fortune, there are thousands more whose longing is never requited. Even those who succeed Often Know Long Periods of Neglect and Poverty. I Did."*** *- Alexander Palmer Haley, in "The Shadowland of Dreams", 1996.*

> ***"Disease arises, like other mental conditions, from association. Since it is a law of mortal mind that certain diseases should be regarded as contagious, this law obtains credit through association, — calling up the fear that creates the image of disease and its consequent manifestation in the body. This fact in metaphysics is illustrated by the following incident: A man was made to believe that he occupied a bed where a cholera patient had died. Immediately the symptoms of this disease appeared, and the man died. The fact was, that he had not caught the cholera by material contact, because no cholera patient had been in that bed. If a child is exposed to contagion or infection, the mother is frightened and says, "My child will be sick." The law of mortal mind and her own fears govern her child more than the child's mind governs itself, and they produce the very results which might have been prevented through the opposite understanding. Then it is believed that exposure to the contagion wrought the mischief."*** *- Mary Baker Eddy, in "Science, Theology, Medicine", Science and Health with Key to the Scriptures, 1875.*

> ***"Howbeit when he, the Spirit of truth, is come, he will guide you into all truth; for he shall not speak of himself; but whatsoever he shall hear, that shall he speak; and he will shew you things to come."*** *- John 16:13*

Ye Shall Know The Truth

> ***"And ye shall know the truth, and the truth shall make you free."*** *- John 8:32*

The Development And Realisation of A New and Novel Idea

"Much of the colour and flavour of that great mind-fruit, the book, depends upon the atmosphere in which the ideas have ripened, the soil whence the sweet or sour juices have been drawn. Many literary productions which we prize among the brightest of our national glories have grown out of human lives, rooted sometimes in sorrow, sometimes in joy.

There are 3 Stages of general opinions regarding the development and realisation of a new and novel idea:

1. The skeptic will say that it is Impossible.
2. He will say that it is Not Practical; therefore Not Valuable.
3. That it has long been known, and only needed application of certain principles which many might have accomplished by giving the matter close attention.

It is that consistency of physical and mental actions, united at all times to battle against failure in its various guises which chronicles in this volume, not the defeats, but the Triumphs of Genius." - in "Triumphs of Genius", 1893.

A Sunbeam of Secular Truth

> ***"Men of science who are much in the society of the educated world, and especially of those favoured classes who have the finest opportunities of acquiring knowledge, are Struck With the Depth of Ignorance Which They Encounter. The Prevailing Ignorance, therefore, of which we speak, Is The Offspring of an Imperfect System of Education, which has already given birth to great social evils; to financial laws unjust to individuals, and Ruinous to the Physical and Moral Health of the Community. If the public be ignorant of science, and its applications, in their more fascinating and intelligible phases; if our clergy in their weekly homilies, never throw A Sunbeam of Secular Truth among their people; if legislators hardly surpass their constituents in these essential branches of knowledge; how can the great interests of Civilization be maintained and advanced?"*** *- in "Researches on Light - Sanatory, Scientific, and Aesthetica", North British Review, August 1858.*

> ***"Ships that pass in the night, and speak each other in passing; Only a signal shown and a distant voice in the darkness; So on the ocean of life we pass and speak one another; Only a look and a voice, then darkness again and a silence."*** *- Henry Wadsworth Longfellow, in "Tales of a Wayside Inn", 1863.*

CONTENTS

Where Does Wisdom Come From..
The Dimensions and Facets of Reality...
What Is Truth? And Why Does It Matter?..
The Pursuit of Truth..
Duties Towards Others in Relation to the Pursuit of Truth......................................
The Cure of Disease..
Emunctology Reference Manual..
The Study of the Extraordinary Function of the Human Body................................
The Sum of Knowledge Concerning the Laws of Health..
The Emunctology Teachings, Best Given by Illustrations, to Enforce the Truths for the Great Ameliorating Influence of Health...
To Lay The Foundation For Those Who Are To Come And Point The Way..............
Truth Matters...
Nature Is Our Friend: Not Our Enemy...
The Older the Book The More Likely You Are to Find the Truth..............................
Quotations From The Works of Many Talented Men..
The Student May Approach The Subject With An Open Mind..................................
To Show The Intricate Relations of Cause And Effect In Disease..............................
Our Women Never Die in Childbirth, They Do Not Allow Medical Doctors to Attend Them on Such Occasions...

Chapter 1

Emunctology Principles of Treatment....56
1 - The Paramount Importance of the Cleansing of the Liver....56
Concerning The Reflex Disorders Types of Organic Affections Upon The Nervous System....57
Concerning Hygiene As A Therapeutic Agent In The Treatment of Disease....57
The Pathology of Reflex Disorders And Its Treatment....58
2 - The Paramount Importance of the Cleansing of the Colon....60
Natural Immunity to Disease is Primarily Due to the Presence of Chemical Substances Which Interfere with the Normal Oxidation Processes of the Cells....61
Biologic Immunity....62
A Healthy State of the Blood Provides Natural Immunity to Infection....62
The Cause and Cure of Cancer: Allergy and Infection....64
Cancer of the Rectum....67
The Importance & Therapeutic Value of Colon Irrigation....68
Colon Therapy....76
3 – The Paramount Importance of Removing All Foci of Infection....77
Dental Foci of Infection in Body Diseases....79
The Relation of Dental Foci of Infection to Systemic Disease....79
Foci Infection in Psychiatric Patients....80
Oral Foci of Infection....82
4 - The Paramount Importance of the Advise on Proper Food Choices....83
The Concept of Totality....83
Interrelationships Among Nutrients....83
A Note on the Emunctory System....84
The Place of Food in Emunctology....85
Dietary Considerations in Disease....86
The Nature of Inflammation....88
Causa Morbi....89
5 - The Advise on the Adequate Vitamin and Mineral Supplementation to the Diet....89
Minerals....90
The Natural Time for the Regeneration of All the Body Tissues....92
Vitamin D, Magnesium, Calcium Carbonate, Iodine and (Sea) Salt....93
These Substances Connect and Interact....93
The Bone-Building Trio....93
The Thyroid and Fluid Duo....93
The Interdependent Action....93
Balance And Equilibrium Is the Key To Health....94
Vitamin D and Calcium Aid in Lung Cancer....94
Vitamin D, Magnesium and Calcium Carbonate Inadequate Intake are Contributing Risk Factors for Various Types of Cancer....94
Vitamin D, Magnesium and Calcium Carbonate Deficits Predispose for Multiple Chronic Conditions....95
6 - The Advise on the Need for Osteopathic Manipulations....96

The Nerve Force and Anesthesia....97
7 - The Advise on the Need for Chiropractic Adjustments....98
Chiropractic and The Nervous System....99
8 - There is a Mind, even a Soul, behind the face of each Individual....101
The Vital and Immortal Principle....104
He Is The Way....105
A Clearer Understanding of the Healing Forces....106
What Is Life?....107
The Therapeutic Importance of The Mental Attitude....109
Instruction for the Physical and Spiritual Sustenance of the Body; Concerning The Correct Mental Attitude for Healing....113
Concerning The Correct Mental Attitude of The Seeker....114
Trust In Him....115
Hand Healing Therapy....116
The Wonders of Water: What Makes It All Possible....116
The Attributes of the Psychic Forces Manifest in a Physical World....119
Healing by Laying On of Hands....119
The Effect of Laying On of Hands on the Growth of Plants....119
State of Healer....120
Healing by Laying On of Hands....121
Therapeutic Effects by Laying On of Hands....121
Therapeutic Touch....123
9 - To Apply Correctly All the Knowledge Received at the School of Health in Emunctology....123
The John Braund Method of Cancer Treatment....124
Braund Method of Cancer Treatment....125
Braund Method & Technique....129
What Happens When Someone Starts Questioning The Medical Trade Cancer Protocol....130
Chaga Extracts Anti-Proliferative Properties in Melanoma Skin Cancer....131
Unofficial Alliance Between United States Public Health Service & American Medical Association; Accepted as Part of Governmental....134
Koch Cancer Treatment....136
Koch Cancer Treatment Antitoxins Therapy....137
Existence of Molecule Is Confirmed After More Than a Century....138
Koch Cancer Treatment Plan....138
Prevention of Cancer, Allergy and Infection....139
Removal of All Foci of Infection....139
Diet and Intestinal Hygiene....139
Healthy Diet....140
Suitable Movement and Exercise....140
Rest and Mental Relaxation....140
Intestinal Lavage....141
Lymphatic Leukemia with Terminal Exhaustion....142
Acute Bulbar Poliomyelitis....142

Had the patient had time for a thorough Intestinal Lavage, and the Elimination of Interfering Drugs like Aspirin, even the spinal injury may have been avoided................142
Acute Lytic type Case of Hepatitis..143
Advanced Bronchiectasis With Asthma...143
Percentages and Causes of Failure..144
Importance of Divalent and Monovalent Cation Balance..145
The Importance of Diet, Calcium Carbonate, Sea Salt and Magnesium.......................145
The Inroads Arising of Septic Poisons...147
Intestinal Toxaemia in its Relation to Cancer..148
What Fulfilment Will Emunctology Bring to the Practitioner.....................................155
The Therapeutic Value of Neuropathy..155
Healthful Routine of Living...156
Health is Balance...156
The Part Taken By Nature and Time in the Cure of Diseases.....................................157
Patterns of Social Adjustment and the Epidemiology of Disease...............................158
On Practical Clinical Observation...160
Physiologic Therapeutics..161
What Can Emunctology Teach..164
How Emunctology Can Aid Humanity...164
Our Organism Possesses an Inexhaustible Creativity and Remarkable Self-Healing Capabilities..165
The Brain is the Main Computer of our Organism..166
The Body Heals Itself...166
Germ Layers...167
Fear & Stress..167
The Clinical Research Showing The Correlation Between a Diseased Organ and Its Brain Manifestation..168
Life Is A Continuation...170
Past Life Memories And Emotional Trauma...172
Reincarnation And Biology...173
Why Emunctology Was Established..176
Concerning the General Emunctology Council...177
General Emunctology Council...179
Synthetic Drugs...180
An Eminent Naturalist Who Became a Great Physician...181
Vitamin D In The Treatment of Cancer..182

Chapter 2

The Science of Oneness...184
Oneness of Force, Oneness of Time..184
3 Perceived Forces Are Single Unified Force..187
Science and Religion are One, When Their Purposes are One....................................188
Experiments with Alternate Currents of High Potential and High Frequency..............189

This Will End Shortages of Food, Raw Material, Germinating Substances & Fuels
Instead of Capitalism & Bolshevism: A True Socialism Will Arise; About Which Christ Preached 2,000 Years Ago; And Taught of Transformation of Matter Into Spirit.............191
One Source of Energy...194
All Matter Comes From A Primary Substance: The Luminiferous Ether......................194
Energy, Frequency And Vibration..194
Tone And Harmony...195
Chiropractic Founded On Tone..195
Life Is The Expression of Tone..195
Man Is A Living Dynamo...196
Luxations Are Caused by Direct Traumatism, Poisons or Auto-Suggestion................198
Reflex Arcs...202
Carl Jung Knew We Have A Soul, Knew There Is A God...204
Look Inside And Know Thyself..204
Collective Unconscious...205
One Consciousness..205
There Is A Realm Outside of What Is Possible to Measure...210
God Also Intervenes In Our Lives...210
We All Know The Truth In Our Hearts We Call It Intuition..210

Chapter 3

The Body Electro-Physiology..211
The Electrical Aspect of the Human Body..211
The Science of Electro-Physiology...214
Neuro-Electrical System: Nerve-Force..215
Hand-to-Hand Deflection and Thumb Pressure..216
Cardiac Muscle...218
On Disease in General..219
Neuro-Electrical System..220
Neuro-Electrical Equilibrium..220
Nerve Cells and Nerve Fibres..223
Bioelectricity And the Electrome..223
The Ionic Milieu...224
General Interaction: Reflex and Retroaction of Periphery on Nervous Center, and Vice Versa...225
The Ionic State..225
The Nature of Mathematics Its Unity and Internal Structure And Its Applicability to Nature...227
The Electrome...228
We Are Electric..229
Neurotoxins..230
The Body's Electrical System...232
Life Is Electricity..232
Neurons And Electrochemistry...233

The Influence of the Nervous System....233
The Science of Electro Therapeutics....234
The Nervous System in Its Relation to Neuro-Electricity; The Function of Nerves in the Human Body....234
The Electric System of the Body....235
Nerve-Force....235
Nerve-Energy....235
A Note Concerning Nerve-Force....236
Knowledge of The Electrical System Given by Nature to Man....238
Energy Flow is the Primary Factor....241
The Flow of Life-Forces....242
Prioré Cancer Treatment....242
We Need a Plasma-Based Physics Rather than an Atom-Based Physics....245
Plasma Is 99.99% of Everything That Is....246
We Need a Universal Science Not an Earth Science....246
99.9% of All Life-Forms Consist of Plasma....247
The Fourth Phase of Water....248
Electrically Expanded Water: The Plasma Form of Water....249

Chapter 4

The Importance of Electro-Therapy....251
Electricity as a Biological Function....251
Of the Living Motor of the Nature of the Living Motor....251
Important Note Concerning Electrical Forces....253
Nikola Tesla Writes About His Experiments in Electrical Healing....254
Electricity And Life....256
Life Without Light Is Impossible....259
What Is Electricity?....259
Everything Has An Electrical System....259
Life Is Electrical Energy....260
Ionization....260
Galvanism and Its Uses in Healing....261
Clinical Applications of the Diathermic Treatment in Gastrointestinal Conditions.....263
Lighting and Its Effects on Behavioural Problems....264
The Importance of Sunlight to Health....265
Sunshine Is An Important Biodynamic Agent. …....265
Vision, Illumination & Ultra-Violet Rays....266
Respiratory Diseases....267
Effect of Air Pollution on the Lungs....267
The Influence of Ultraviolet Light Upon Circulation....269
The Usefulness of the Treatment of Electro-Therapeutics....269
The Effects of the Diathermy Current....270
A Note on the Treatment of Diathermy....270
Concerning Light Vibration Diathermy....271

Electricity Is To Fill A Great Place In The Future..271
Counter Indications for Electro-Therapy..272
Safety Precautions...272

Chapter 5

Colour Therapy..273
The Vibratory Forces of Colour..273
The 3 Most Useful Colours in Colour Therapy..277
Colour, Light And Vibration...277
How Light Generates Life..277
The Solar Spectrum..277

Plate I - Illustrations of Acute Parenchymatous Degeneration of the Nervous System....596
Classification of the Auto-Intoxications....604
The Morphological Effects of these Poisons on the Ganglion Cell....607
I - The Acute Gastro-Intestinal Auto-Poisons....611
II - The Subacute Gastro-Intestinal Poisons....618
III - The Chronic Gastro-Intestinal Poisons....618
Cytothesis (The Process of Cell Repair)....619
The Value of Hydro-Therapeutic or other Anti-Toxic Measures in Insanity....620
The Toxic Power of the Blood in Auto-Intoxications in General....623
Lacteals Are Important Structure of the Lymphatic System - Study in Detail....634
Lacteals....634
Lymphatic Endothelial Cells....634
Lymphatic Vascular System....634
Regenerative and Proliferative Characteristics....634
Lipid Uptake in Lacteals....634
The Critical Role of Lipid Metabolism in Health and Diseases....636
Lipids....636
Free Fatty Acids....636
Chronic Nutritional Excess....636
Nutrient Overload....637
Modern Diet Pattern and Physical Inactivity....637
Metabolic Diseases Are Preventable....637
Inflammatory Bowel Diseases And Metabolic Disorders....637
Inflammatory Bowel Syndrome and Abnormal Intestinal Metabolism....639
Neutrophil Extracellular Traps and Sepsis....639
Neutrophil Elastase....640
Neutrophil Extracellular Traps and Intestinal Ischemia Reperfusion Injury....640
Neutrophils (White Blood Cells)....640
(N)ETosis....641

Lipid Metabolism in Homeostasis And Disease...641
Lipid Metabolism in Cancer..642
Lipid Metabolism in Neurodegenerative Diseases...642
Lipid Metabolism in Cardiovascular Diseases...642
Lipid Metabolism in Aging..643
Metabolic Disorders...643
Bile Acid Flow...644
Reconstruction of Gut Microbiota...644
Intestine Organization and Function..645
A Pure Mind In A Pure Body, That Is Health...647

Chapter 13

Sound in Reviving Blood Cells..649
The 4 Postulated Laws of Cymatics...650
The Medical Trade So-called "Genetic Theory of Disease", Down The Drain............652
The State of the Blood A Major Factor In Aiding Rejuvenation of the Body Or Establishing Disease...653
Blood-Poisoning By The Medical Trade Drugs..657
Medicines Are Poisonous, or Anti-Vital in their Tendency..659
Blood Red Cells Conquer Pain..661
Toxaemic Conditions Bring About Destruction of Leucocytes....................................661
The Alkalinity of the Blood And the Number of the Leucocytes.................................664
Emotions Affect White Blood Cells...665
The Discovery of Red Blood Cells Acting as Micro-Electrodes..................................666
The Electro-Magnetic Aspects of Red Blood Cells..666

Chapter 14

Diseases Proceed Primarily From an Impure State of the Blood.................................678
Toxicity of the Blood..678
Toxicity of the Blood in Influenza..679
The Role of Secondary Microflora in Influenza...680
The Pathogenesis of Influenza...682
The Relationship of Toxaemia to Heart Disease..683
Diphtheria...683
Causes of Death..683
Concerning Disease & The State of the Blood..683
Chronic Nervous Cough...686
These Irritating Elements May Be From 3 Sources..686

Chapter 15

Tooth Nutrition...689
Dental Caries From Poor Food Choices...690

Complete Tooth Nutrition....692
The Teeth As A Foci of Infection....694
Endodontic-Endotoxemia....695
Disease & Food Choices....698
Faulty Nutrition: The Influence of Diet, Need for Investigation....700
The Power of Food And Its Effects In The Human Body....701
Relation of Diet to Sound Teeth....701
Prenatal Feeding....702
The Unnatural Dietary of Civilised Nations....703
Oral Sepsis....704
Diseases Due to the Absorption of Septic Products Into The Circulation....705
Pernicious Anaemia....705
Debility....705
Diseases Influenced by the Presence of Oral Sepsis....706
Oral Sepsis Connected With Cancer....706
Oral Sepsis A Major Factor in Cancer....706
Disorders Instead of "Diseases"....708
Reflex Disorders of Dental Origin....710
Reflex Disorders....710
Dental Origin of a Distant Pain....712
Diseases of the Peridental Membrane....714
Reflex Action as a Cause of Disease....716
Neurosis and Reflex Disorders....717
Clove Oil....718

Chapter 16

Epilepsy....719
Epilepsy And Its Treatment....721

Chapter 17

The Function of The Kidneys As Emunctories....729
Renal And Urinary Diseases....729
Adult Digestive And Intestinal Diseases....729
Renal Stasis....730
Renal Stasis; leads to Renal Disease, and Arteriosclerosis....730
Identity of the Vascular Lesion found in these Children With Diffuse Hyperplastic Sclerosis in Adults....730
Renal Disease....731
Concerning The Effects of Toxaemia, Emotions And Temperature Upon The Health And Function of Kidneys....732
The Functions of the Kidneys....733
All Varieties of Hypertension Are of Renal Origin....734
The Role of the Alloxuric Bases in the Production of the Cardiovascular Changes of

Nephritis....................735
Uric Acid Acts as a Factor in the Causation of Disease....................738
Relationship Between Certain Products of Metabolism and Arterial Hypertension.....740
Auto-Intoxication Causing Renal Lesion....................742
Toxaemia As The Main Factor Upon The Renal Involvement In Hypertension..........746
Cardiovascular Disease....................747
Cardiovascular Disease Represents 30% of All Deaths Globally....................747
Cancer....................748
The Relationship Between Atherosclerosis & Cancer....................748
Common Risk Factors for Cancer and Atherosclerosis....................748
The Protective Function of the Liver And Kidneys....................749
Direct Hepatic Toxicity....................757

Chapter 18

Factors In The Causation of Tuberculosis....................758
Physiology of Mycobacterium Tuberculosis....................759
The Workings In The Body System That Give Rise To Tuberculosis....................760
Poor Elimination As A Factor In the Causation of Tuberculosis....................760
Toxaemia As A Factor in the Causation of Tuberculosis....................761
The Impaired Action of Toxaemia Upon the Body System, Which Eventually And Inevitably Leads to Imperfect Action of the Kidneys....................763
The Function of the Kidneys....................766
The State of the Kidneys in Preventing Tuberculosis....................767
The Link Between Chronic Kidney Disease & Tuberculosis....................768
Lymphoid Nodules (Peyer Patches)....................770
The State of the Lymphatic System in Tuberculosis....................772
Methods Employed....................773
Mesenteric Nodes....................774
What does general experience teach as to children born of tuberculous mothers?.......776
Tuberculous Inflammation....................780
The Primary Location of Tuberculosis Outside the Respiratory Tract in Adults: With special reference to its Occurrence in Lymph Nodes in its Relation to Pulmonary Tuberculosis in Adults....................782
The Infection In New Born Babies....................783
Tuberculosis in the Respiratory Tract....................786
A Note on Expectorants....................786
The Treatment of Tuberculosis....................787

Chapter 19

Concerning Immunity....................793
Auto-Infection as A Factor in Disease....................794
Treatment & Cure of Typhoid Fever....................802

Chapter 20

On the Functions of the Skin in Relation to Life, Health and Disease..........................803
Exercise And The Lymphatic System...810
Leukocyte Redeployment During Exercise And Recovery..810
The Care And Cleansing of The Body..811

Chapter 21

Lymphatic System...817
The 3 Functions of the Lymphatic System...817
The Glymphatic System..817
The Interstitium System..818
The Body Interstitial Spaces: A Vast Interconnected Whole..818
Interstitium Vast Interconnected Network of Fluid-Filled Spaces Throughout the Body..819
Structural Continuity Across Organ Boundaries..819
Gut-Liver Axis..821
The Central Nervous System has a System of Lymphatic Vessels...............................821
Gut-Brain Axis..821

Chapter 22

The Effects of Anaesthesia Upon the Brain..822

Chapter 23

Thalamus..825
Thalamic Consciousness Switch...825
The Oxygen Needs of the Brain..826

Chapter 24

Every Part of the Body Sympathizes with the Mind..829
The Influence of Ideas Upon the Body..829
Psychogenesis and Internal Secretion...830
Mind And The Stomach..831
Emotion Can Ruin Your Health..832
Heightened and Concentrated Attention...833
The Influence of the Power of Suggestion: Over Minds, Over Matter, Over Disease of Body or Mind...836
The Value and Usefulness of Psycho-Therapeutics..838
The Drift Towards Nature Curing...840
Methods of Treatment in Neuroses & Psychoses...841
Cerebral Affections: The Symptoms of Diseases Seated in Other Organs than the

Brain...842
The Effects of Emotional States on Metabolism...843
Gastro-Intestinal Reaction to the Emotions...843
The Nature of the Hypnosis..852
Thoughts Are Things..852

Chapter 25

Bile Stasis Its Effects on Jaundice And Gallstones.......................................853
Pathology of Jaundice...853
Obstructive Forms of Jaundice...854
Symptomatology..855
Duration..855
Treatment of Catarrhal Jaundice..855
Gallstones...856
Treatment of Bile Stagnation...857
Common Treatment of Gallstones..858
Treatment of Gallstones...859
Treatment of Constipation Accompanying Gallstones.................................859
Hydropathy...859
The Treatment of Biliary Disease...859
Medical Trade Drugs Effects Upon the Liver...860
Arsphenamine Jaundice..860
Cinchophen Jaundice..861
Atophan Jaundice..861
Dinitrophenol Jaundice...861
Syndrome of Bile Salt Retention...862

Chapter 26

Concerning Stasis, A Major Factor in the Causation of Disease, And Drainage as a Factor in Resolving Disease...863
The Lymphatic Constitution and its Relation to Some Forms of Sudden Death...........864
In All Parts of the Body Free Drainage Is Essential for the Cure of Infection.............865
All Circulation Promotes Healing..866
Urinary Stasis...867
Degradation And Clearance..868
Intestinal Stasis...868
Stasis Allows the Absorption of Toxins which Enfeeble the Whole of the Connective Tissue Elements...869
Intestinal Stasis and Other Foci of Infection...870
Some Fundamental Causes of Disease...870
Endocrine to Organ: Drainage, Detoxification and Disease.........................875
Concept of Congestion..875
Endocrine-Digestive Glands Couplings..876

Hypothalamus, Pituitary, Large Intestine....876
Corticotropic: Stomach, Small Intestines, Kidney....876
Gonadotropic: Liver, Gallbladder....877
Thyrotropic: Exocrine Pancreas, Intestines....877
Endocrine-Emunctory Relationships....877
General Catabolic: Liver, Digestive Tract....878
Corticotropic: Kidney, Skin....878
Thyrotropic: Lungs....878
Endocrine-Emunctory Interaction and Disease....878
Endobiogeny....878
Role of the Endocrine System....879
Liver: Key to Buffering Capacity....879
Splanchnic System....880
Emunctories....880
Autonomic Nervous System-Endocrine-Emunctory Integration....881
Stages of Disease Development....881
When In Doubt Drain The Key Emunctory....881
Dysbiosis....882
Implications of Dysbiosis in Local, Regional, and Systemic Disorders....883
Conditions And Sates of Health....883
Diseases of Accumulation....883
Diseases of Elimination....884
The Microbiome....884
Symptoms Related to Dysbiosis....885
Equilibration of Flora....886
The Liver....886
The Skin....887
Lungs as Emunctory....887
Emunctory Deficiency in Extrinsic Asthma....888
Menstrual Cycle Disorders....889
General consideration of Emunctories and Glands....889
Liver....889
Gallbladder....889
Exocrine Pancreas....890
Endocrine Pancreas....890
Intestines....890
Pelvic Circulation....890
The Emunctories....890
Clinical Pearl: When in Doubt, Drain....891
Clinical Pearl Gastrointestinal tract: Quotidian junction of all other elements of terrain....891
Clinical Pearl: When in doubt, drain and restore....892
Clinical Pearls: Mindset in practice....892
Endocrine-Organ Couplings....892
Physical Examination....892

Electrolytes and Adrenal Insufficiency...892
Lymphatic Drainage and Neurological Disease..893
Trauma and Lymphatics..896
Blood Stasis a Factor in the Causation of Disease...897
Mechanisms of Compensation of the Blood Circulatory Disturbances in Venous Stasis...898
Blood Stasis and Atherosclerotic Factors on Cognitive Impairment............................898
Chronic Intestinal Stasis...899
Tonic Colon Hardening..899
Intestinal Adhesions A Factor in Chronic Intestinal Stasis in Epilepsies.....................902
The Relationship of Chronic Intestinal Stasis to Epilepsy..903
The Relationship of the Intestinal Flora to Chronic Intestinal Stasis...........................904
Intestinal Stasis a Factor in the Causation of Cancer..908
The Relation of Chronic Intestinal Stasis to Cancer...911
Internal Secretions..914
Lymph Stasis...914
Lymph Stasis Promotes Tumour Growth..915
Lymph Stasis in the Causation of Disease...915
The Relation of Obstructed Cardiac Circulation to Lymph Stasis...............................918
Lymph Stasis the Precursor of Cancer...920
Cancer is a Product of Lymph Stasis..920
Breast Cancer...921
Lymph-stasis the Precursor of Cancer...922
Lymphoid Tissue In Health...923
Lymphangioplasty..923
Lymph-Stasis The Precursor of Breast Cancer..925
Lymphatic Obstruction as the Cause of Chronic Mastitis..926
Chronic Mastitis...926
Prevention in the Light of Aetiology..927
The Real Story Behind the Pink Ribbon..927
Note on Antiperspirants..930
Breast Cancer Screening Farce...930
Intestinal Toxaemia in its Relation to Cancer...932
Constipation and Breast Cancer..933
National Health and Examination Survey...934
Stasis...936
Copro-stasis..936
Apostasis...936
Stasis in the Causation of Disease..937
Venous Stasis in Optic Neuritis..937
Stasis of Bile...938
Bile Pigment...939
Stasis of Bile: Favours Bacterial Colonization..944
The Energy Source of the Psychoneuroses..944
Stasis Neuroses...945

Promoting Cellular Drainage....945
Improper Drainage....945
The Concept of Drainage....949
Setting up Drainages....950
Manual Therapy Techniques to Improve Drainages....950
Drainage of the Head and Neck....951
Draining Cervical Lymphatics....952
Lymphatic and Venous Drainage....954
Thoracic Lymph Drainage....954
To Stimulate Lymph Flow....955
To Increase the Volume of Lymph....955
Treatment for Drainage and Circulation of the Thorax....957
List of Toxins and Waste Products Lymph Drained by the Lymph....957
Lymph-Stasis Arising as a Primary Condition in Various Organs, or Partly So....957
The Concept of Drainages....958
Perfect Drainage....961
Lymph Drainage Therapeutic Method....962
Osteopathic Treatment of the Lymphatic System in Disease....965
Stability of the Internal Environment....966
Drainage in Glaucoma....967
The Vital Importance of Drainages....968

Chapter 27

The Vasomotor System....970
The Vaso-Motor Nerves....970
Real Osteopathy....971
Cardinal Principle of Osteopathy....971
Anatomy and Physiology of the Vasomotor Paths and Centers....985
The Trophic (Feeding & Nutrition) Functions of the Nervous System....987
Dependence of Muscle Nutrition on the Nervous System....988
The Vasomotor Innervation of the Extremities....988
Dependence of Glandular Activity on the Nervous System....988
The Influence of Reflex Stimuli....989
Reflex-Dependent Factors in the Trophic Functions of the System....989
The Fundamental Aim of Osteopathy is to Normalize the Mechanism of the Body....989
Pressure and Poison....990
The Influence of Anaesthetics on the Vasomotor Centres....992
Vaso-Constrictor Nerve-Fibres....1003
Stomach and Intestine....1004
The Pancreas....1004
The Spleen....1004
The Liver....1004
The Lungs....1004
Pelvic Organs....1004

The Uterus....................1004
The Limbs....................1005
The Trunk....................1005
The Heart....................1005
The Voluntary Muscles....................1005
Vaso-Motor Reflexes....................1005
Vasomotor Reflexes....................1006
The Vasomotor in Melancholia....................1007
The Wholeness of Nerve-Cure....................1008
The Pressures....................1008
Sore Spots....................1008
The Apparatus Strains....................1008
Circulating Poisons....................1008
The General Principles of Vaso-Motor Therapeutics....................1009
Vaso-Motor Therapeutics Its Bearing on the Rectal Treatment of Functional and Nervous Diseases....................1011
Nerve Force....................1012
Whence Obtained....................1012
Vaso-Motor Nervous System....................1015
Reflex Irritation....................1018
The Principle of Reflex Action....................1019
Examples of Reflex Irritation....................1020
Spinal Irritations....................1021
Diseases of the Rectum....................1025
Peripheral Circulation....................1029
Nervous Irritation....................1029
Vaso-Motor Influence Over the Circulation....................1039
Vaso-Motor Nerves....................1040
Osteopathic Principle....................1044
Cerebral Toxaemia a Major Factor in Insanity....................1045
Some Notes On Fascia....................1047

Chapter 28

Water Is The Driver Of Nature....................1048
Water Has 4 Phases, Not 3....................1048
The 4th Phase of Water....................1048
Can Water Really Contain Energy?....................1049
Water As An Energy Converter....................1049
Water Stores Energy....................1049
The Central Role of Water in Cell Function....................1050
The 4 Phases of Water....................1051
The Gel-Like Nature of the Cytoplasm....................1052
How Water Works In The Body....................1053

Chapter 29

The Endocrine System..1056
Endocrine System Adrenal Gland Procedures..1057
The Activity of the Endocrine System...1058
The Importance of the Pituitary Gland or "Arch Gland"...1061
The Emotional Life and its Reflection in Conscious Sensory and Motor Reactions..1062
Cerebrospinal System...1064
Prenatal Causes of Mental Retardation..1065
Organic Toxins..1066
Inadequate Oxygen..1066
Nutritional Problems...1066
Circulatory Failure...1066
Postnatal Causes of Mental Retardation..1067
Glandular Dysfunctions...1067
Wrong Diet, Wrong Thinking And Wrong Living Can Cause Disturbing An Upheaval In The entire Endocrine Glandular System..1068

Chapter 30

Intestinal Toxaemia, Or Alimentary Auto-Intoxication..1072
Valuable Curative Means...1072
Bacterial Toxins and Pigments...1073
The Influence of Food Upon Bacteria...1073
Bacteria Are Everywhere..1075
The Intestinal Flora...1075
Intestinal Bacteria...1077
Defensive Action of the Liver..1077
Other Defensive Means..1077
The Ileocecal Valve..1078
The Influence of Toxins Upon Living Cells...1078
Alimentary Toxemia...1079
Intestinal Toxins...1079
Pressure Raising Poisons Cause Hardening of the Arteries...1080
Influence of Diet on Intestinal Flora..1080
Stasis Causes Toxemia & Gall Stones..1081
Fatigue Poisons Produced in the Intestines...1081
Joint Symptoms Due to Intestinal Toxemia..1081
Intestinal Poisons and High Blood-Pressure...1081
Arteriosclerosis Caused by Intestinal Poisons...1082
Intestinal Toxemia and Insanity...1083
The Tongue an Index to the State of the Colon...1083
The Cause of Arthritis and Gout...1083
Tetany, Rheumatoid Arthritis and Myxedema Caused by Intestinal Toxemia............1084
Intestinal Stasis...1084

Toxemia the Cause of Hepatism..1085
The Symptom Complex of Intestinal Toxemia..1085
Skin Diseases Due to Intestinal Toxemia..1086
Intestinal Origin of Certain Eye Diseases..1088
The Effects of Intestinal Poisons..1088
Bacteria Produce Highly Virulent Poisons...1088
The Most Common Putrefactive Colon Bacteria..1089
Important Note Concerning Bacteria...1090
Pleomorphism of Bacteria..1090
Colon Infection And Its Effect Upon the Urinary Tract..1092
Colon Bacillus Pneumonia...1093
Focus of Infection...1094
Pathogenesis...1094
The exact manner and path of absorption from the peritoneal cavity of injected foreign agents...1096
The existence of a direct lymphatic absorption as opposed to or in conjunction with a hematogenous absorption...1096
Colon Bacillus Infections...1098
Hematogenous Infection...1099
Infection by Contiguity...1099
Types of Infection Produced by the Colon Bacillus..1101
The Urine of Colon Bacilluria..1102
Symptoms of Colon Bacillus Infection...1102
Chronic Interstitial Nephritis..1102
Cholecystitis..1103
Pyelitis and Pyelonephritis...1103
Acute Unilateral Septic Infarcts of the Kidney..1103
Choroiditis Inflammation of the Choroid and Retina of the Eye..............................1104
Colon Bacillus Infections...1105
Virulence of the Organism: Resistance of the Tissues...1106
Symptomatology Clinical Findings..1106
Chronic Interstitial Nephritis..1107
Appendix...1108
Biliary Tract..1108
Peritoneum..1108
Organs Other Than the Kidney, Liver, Bile Ducts, Appendix and Peritoneum...........1108
Colon Bacillus Cystitis and Pyelitis...1109
The Toxic Effects of Poisons Upon the System...1109
Endo-Toxins..1110
Anaphylactic Phenomena Associated With Intestinal Toxemia.................................1110
Changing and Reforming the Intestinal Flora..1110
The Milk Diet..1111
Results of Recent Experiments..1111
Increased Intestinal Activity...1112
The Milk Cure...1115

Perverse Or Deficient Nutrition..1116
Faulty Nutrition..1118
Perverse Nutrition..1119
Chronic Gastro-Enteritis..1121
Coated Tongue..1127
Care of the Mouth...1127
Exercise and Baths...1127
The Results...1128
Fruit Regime Before Milk Regime..1129
Advise Against Fasting..1130
The Fasting Body Feeds upon Itself..1132
Significance of Coated Tongue..1140
A Person May Be Sensitized to Milk...1145
Autointoxication: The Cause of Goiter in Pigs..1146
Faulty Nutrition or Bad Food Choices...1147
Toxic Load..1149
Prodromal State of Bacterial Invasion...1150
Paralysis Agitans (Parkinson's Disease)...1150
Bad Food Choices A Major Factor in the Causation of Disease.......................................1151
Misuse of Food: The Principal Factor in The Causation of Disease.................................1154
Common Health Conditions Associated with Ageing...1156
Top 10 Chronic Conditions in Older Adults..1156
Chronic Conditions..1157
Eyes Disease & Oral Hygiene...1158
Chronic Cerebro-Spinal Toxaemia: Substitute Term for Rheumatoid Arthritis..........1159
Hardening of the Arteries...1160
Diminished Supply of Food and Oxygen...1160
Disorders of Deficiency of Thiamin, Niacin and Pyridoxin...1161
Disorders are Exacerbated by Physical Exertion...1161
Thiamin Deficiency..1161
Niacin Deficiency...1161
Pyridoxin Deficiency..1161
Nutritional Debt and Oxygen Debt Following Severe Physical Labour.....................1161

Chapter 31

The Colon As The Seat of Disease..1162
Colon Infection...1166
The Cecum Cesspool..1166
The Function of the Appendix..1166
The Relation of Surgery to Osteopathy..1169
The Surgeon had Failed to Cure...1170
The Treatment for the Chronic Invalid...1171
The Treatment of Morning Headaches..1171
The Hydro-Therapeutic Institute at the University of Berlin...1172

Important Life-Saving Measures..1173
It's Not the Bacteria: It's The State of the Colon..1174
The State of the Colon: The Frequent Seat of Disease..1176
The State of The Colon Has a Varied Influence in Disease...1178
The State of the Colon: A Main Factor in the Causation of Disease...........................1178
The Disease Can Be Traced to Having Eaten Too Much Indigestible Food................1179
Colonic Therapy..1180
Colonic Irrigations..1181
Making Osteopathy More Effective by the Use of Colon Hydropathy.......................1185
Irrigation of the Colon...1188
Rectal Feeding..1188
Chronic Parenchymatous Nephritis...1188
Functional Diseases of the Nervous System Convulsions..1188
General Anesthesia...1189
Treatment of Complicated Cases..1189
Gastrointestinal Conditions..1189
Colonic Irrigation..1189
Sanitary Value of Cleanliness...1190

Chapter 32

Hydropathy...1191
The Physiological Basis of Hydropathy..1191
Homeostasis and Thermal Stress..1198
The Effects of the Toxic Burden Upon the Body Varies with the Time of Year.........1198
Fundamental Indications in the Treatment of Typhus..1199
The Treatment of Menstrual Disorders of Utero-Ovarian Origin...............................1199
Water The Principal Chemical Constituent Of The Human Body..............................1200
Influenza And Its Treatment..1200
What Causes Influenza...1206
The Treatment of Influenza by Water...1206
The Cause of Death in Influenza: Septicemia (Blood Poisoning by Bacteria)............1207
The Cold Water Treatment..1208
The Flu Germ Bacilli..1209

Chapter 33

The Pathogenic Importance of Auto-Intoxication..1211
Neuralgia..1213
Constipation..1213
Irrigation and Manipulation of the Bowels...1215
Applications of Light...1215
Applications of Water...1216
The Use of Electricity...1216
Mechanical Auxiliaries..1216

Alcoholism....1217
Cirrhosis of the Liver....1217
Colon Irrigation....1218
Diarrhea....1218
Functional Disorders....1219
Rheumatism....1223
Chronic Gastritis (catarrh of the stomach)....1223
Gastro-Intestinal Stasis....1223
The one characteristic feature of Gastro-Intestinal Stasis is its Endless Symptomatology....1228
Hygienic Considerations....1229
Dietetic Questions....1229
Colon Irrigation....1229
The Benefits of Colon Irrigation Must Be Experienced To Be Appreciated....1229
Mechanical Therapy....1230
Electro-Therapeutic Applications....1231
Gonorrhea (Specific Urethritis, Clap)....1232
Haemorrhoids....1232
Hysteria....1232
Inflammation (Chronic)....1233
Internal Secretions....1235
Nutritional Reconstruction....1237
Gastric and Intestinal Disturbances....1238
Appendicitis....1238
Fever....1239
Uremia....1239
Paralysis....1240
Colonic Irrigation as a Factor in Eliminating Focal Infection....1243
Visceral Disease Is Always Accompany By Mental Changes....1247
Relation of Mental Symptoms to Bodily Disease....1250

Chapter 34

Causes of Mental Disease....1252
Mental Influence....1253
Auto-Intoxication as an Etiological Factor in Many Forms of so-called Mental Disease....1253
The Relation of Oral Infection to Mental Diseases....1268
Secondary Foci of Infection....1268
General Considerations on Nervous and Mental Diseases....1270
Psychological Disorders....1272
The Aetiological Factors in the Psychoses....1273
Delirium....1273
The Role of Auto-Intoxication in Mental Disorders....1273
The Toxic Origin of Mental Disease....1275

Prodromata of the Psychoses and Their Meaning..1275
Bidirectional link Between the Brain, Gut and Microbiome......................................1289

Chapter 35

Organ Axis Organ Cross-Talk Organ Interaction Networks.......................................1290
Biological Communication Systems...1290
Biochemical Reactions Dynamic Equilibrium..1291
Extracellular Fluid...1291
Cellular Level Biochemical Reactions...1291
Homeostasis Underlies All Disease Processes..1291
Organ Interaction Network: Biochemical Signals and Neural pathways...................1292
Organ Cross-Talk..1292
Organ Connections - Dysfunction In One Organ Precipitates Failure In The Other...1292
Vicious Cycle of Multi-Organ Injury...1293
The Gut–Liver–Brain Axis: 3-Way Interaction System..1293
Inter-Organ Interactions..1293
Interconnected Physiological Networks: Bidirectional, Multi-Way Axes..................1294
Organs Don't Function In Isolation...1294
The Microbiota-Gut-Brain Axis..1294
Communication Networks Maintain Physiological Homeostasis..............................1294
Brain-Body Axis..1295
Brain-Adipocyte Axis..1295
Adipocytes Cells...1295
Brain-Bone Axis..1296
Skeletal Homeostasis..1296
Peripheral Hormones...1296
Profound Link Between The Brain And Bone..1297
Neurotransmitters..1298
Central Nervous System..1298
Growth Hormone...1298
Brain-Marrow Neural Circuit..1299
Growth Hormone and Central Nervous System..1299

Died of Apparent Drug Reaction..1448
Drug-Induced Diseases...1449
The Patients At Risk...1449

Antibiotics....1451
Psychoactive Drugs....1452
Drug Effects Blamed for 20% of Hospital Deaths Among Elderly....1453
The Main Influences in Reduction of Diseases....1453
Therapy Made No Contribution....1453
The Problem With Medical Trade Antibiotics....1454
The Destruction of Friendly Bacteria....1454
The Case of Ingrid Betancourt Mother....1456
“They Are Poisoning Me!”....1458
Stevens-Johnson Syndrome / Toxic Epidermal Necrolysis....1458
Diagnosed With Toxic Epidermal Necrolysis....1461
Mechanical Ventilation Death Sentence....1462
Orotracheal Intubation With Mechanical Ventilation....1463
Renal And Neurological Side Effects of Colistin in Critically Ill Patients....1464
The Pharmaceutical Blunderbus....1466
Ingrid Betancourt Mother Case....1466
In Hospital: You Don’t Die From The Disease; You Die From The Medication....1466
It Is The Medication that Kills You....1466
Polypharmacy....1466
State of Semicomatose and State of Blepharitis....1467
In Her Hospital Death Bed She Started to Pray Not for Self But For Others....1467
State of Sialorrhea....1467
The Deadly Hospital Protocols....1469
They Are Dying in Our Hospitals....1469
The Cognitive Dissonance of the Medical Trade Shows Clearly Inconsistency of Thought And The Ability to Hold 2 Contradictory Ideas Simultaneously....1469
Killed By The Medical Trade With 31 Pharmaceutical Drugs....1470
Avoid Hospitals As Much As You Can....1471
The Disconnect of the Medical Trade From Reality....1472
The Medical Trade Is Mentally Unwell....1472
The Medical Trade Suffers from Compulsive Lying Disorder....1472
Medical Trade Devices Induce Infection....1473
Infections Attributed to Biofilms....1473
Biofilms on Medical Devices....1474
Medical Radiation Induces Cancer Leukemias....1474
The Number of Cancer Leukemias Generated Every Year By Medical Trade Diagnosis....1474
Indiscriminate Drugging....1475
Guillain–Barré Syndrome....1475
95% World Population With Health Problem 33% With More Than 5 Diseases....1476
The Medical Trade Drugs: Pharmaceuticals & Their Toxic Effects on Blood Formation And the Bone Marrow....1476
Medical Trade Hepatotoxic Medication....1477
Myocardial Infarctions....1478
Cardiogenic Shock....1478

Medical Trade Sedatives, Palliatives or Any Other Pharmaceutical..........................1479
Treatment of Drug-Induced Liver..1480
Concerning the Treatment of Acidosis..1481
Concerning the So-Called Medical Trade Field of Psychiatry..................................1481
The Problems of Medical Trade Pharmaceutical Drugs..1482
Every Man Is Presumed To Be Sane...1484
Insanity is a Bodily Disease; A Morbid Action of the Brain.....................................1484
What Is Insanity?..1485
Mens Sana In Corpore Sano...1486
There Is No Defined Line Between Mental Soundness and Unsoundness................1487
Ostentatious Display of Medical Lore..1487
Concerning "Medical Experts"..1487
No Medical Man is Competent...1487
The Medical Men Should Avoid Defining Insanity..1487
Who is to Judge One Another?..1488
1 in 5 Americans On Psychiatric Drug Medication..1488
Medical Trade Poisonous Synthetic Pharmaceutical Psychiatric Medication............1488
The Case of Eleanor Riese..1489
Lanterman–Petris–Short Act...1489
Individuals can be Detained and Lockdown..1489
The UK Mental Health Act The Imprisonment by The Medical Trade With Forced Mediation...1491
Forced Treatment Without Consent for 6 Months under Mental Health Act.............1492
The Mental Health Act; The Precursor to Lockdowns & Medical Trade Tyranny......1492
Psychiatrists Have Higher Incidence of Mood Disorders..1493
The Mentally Ill "Treating" The Mentally Well...1493
Suicide by Nurses Within 12 Months Of Mental Health Service Contact The Majority Are Mental Health Nurses...1494
1. The Prescription And Taking Psychiatric Poisonous Medication...........................1494
2. Suicidal Ideation...1494
Serotonin-Norepinephrine Reuptake Inhibitors (SNRIs)..1494
Selective Serotonin Reuptake Inhibitors (SSRIs)..1495
3. Knowledge About The Effects Psychiatric Medication..1495
4. The Trigger: Adverse Life Events Within 3 Months of Death................................1496
5. The Number of Suicides In Metal Nurses Is Much Greater...................................1496
Psychiatry A Malevolent Entity..1496
Several Medications Linked to Violent Acts...1496
The Utterly Useless And Dangerous Medical Trade...1497
There Is No Informed Consent...1497
Medical Trade Fraud the Infamous Serotonin Hypothesis..1498
The Nonsensical Medical Trade Lie: That Mental Illness Caused by "Chemical Imbalances" In The Brain Is Not Empirically Substantiated..1499
Depression Not Caused by Abnormalities in Brain Chemicals.................................1499
Manipulative Behaviour of The Medical Trade Coercion, Threatening and Force of Authority...1500

Acknowledgement of Great Assistance Rendered

We hereby Acknowledge; the Immense Assistance which Professor Ingrid Betancourt, Ph. Ed. made towards, the Aid and Help, for the completion of the Research and Publication of: This and All other Books of the Order, which; With her Effort and Work has Contributed to Make It Possible. For Some have Worked; Some have Toiled; Some have Sacrificed Self, day and night for the benefit of Thee; of Others. Then, ***Be Thou Grateful to the Lord; for this His Blessing. For, from those activities where there have been the incomes, the helps, and the aids that have been given for others, from those characters and natures, has expected, for His Promises Are Good; there came resources to carry on. For that ye give of yourself in service to others, that ye retain. These come back to self; as in the sowing of good deeds. These are not as idle words; but if the service is given that ye may have good things only, you already have your reward.*** *But in keeping in the helpfulness for others, in the activities in that direction may there come the greater service to self, to those dependent upon self.* ***And ye know in whom ye have put thy trust; ye should know; ye do know. For the earth is the Lord's. Trust rather in Him. And as ye do to others may it be done to thee.***

"1. Always make sure that you form a distinct, and clear idea of the matter you are considering.

2. Always avoid vague approximations where exact estimates are possible." *- Professor Pierre Charles Alexandre Louis, MD, observed that All Fevers had the Same Origin; they were Manifestations of the Inflammation of Organs, in his teaching lectures to students, 1834.*

"An investment in knowledge always pays the best interest." *- rev. John Hill Aughey, in "Spiritual Gems of the Ages", 1886.*

The Older the Book The More Likely You Are to Find the Truth

> ***"For my Research, I acquired an Extensive Book Collection. Some Books are well over 100 years old. The Older The Book, The More Likely You Are To Find The Truth."*** *- John Hamer, Author of "The Falsification of Science", 2021.*

Quotations From The Works of Many Talented Men

"The reader will observe that throughout the volume: The Editor has Availed himself, in his Notes, of Quotations From The Works of Many Talented Men, Both Ancient and Modern, In Support of his Assertions; men of sterling abilities, who, for the most part are now beyond the reach of flattery, but who, when living, were among the brightest ornaments of human excellence; **with the cheering hope that this exertions, here given, in the cause of Health and Weal (in a Healthy Prosperous State)**, supported and sanctioned as, they have hitherto been, will again insure as favourable a reception to this edition, of which was to be attributed much to the simplicity of its style and composition; its object being:

> ***"To Hold the Golden Mean,***
> ***To Keep the End in View,***
> ***To Follow Nature."*** *- Lucan, "De Bello Civili", Book II, Verse 381, 46 B.C.*

- Dr Edward Jukes, Surgeon, in "On Indigestion and Costiveness, and the use of Lavaments", 1833.

The Student May Approach The Subject With An Open Mind

> ***"Various Theories and Explanations; which are commonly adduced Have Been Omitted, so that the student may approach the subject with an Open Mind, but with the assurance, that all the movements described, have been thoroughly Tried and Found Useful. He will thus be in the advantageous position that he starts, with No Preconceived Theories, and his mind will be unbiassed. In this manner, we may Ultimately Arrive at the Truth."*** *- Dr Thomas Marlin, MD, MB, DPH, RCPS, DMRE, in "Manipulative Treatment", 1934.*

> ***"Let no corrupt communication proceed out of your mouth, but that which is good to the use of edifying, that it may minister grace unto the hearers."*** *- Ephesians 4:29*

"An author who presents something unusual appeals with dignity to posterity, because a tribunal must first be formed before which the unusual can be judged, and only time can establish such a court, stripping the strange from the strangest, and presenting it as something familiar." *- Goethe, on his Physics.*

To Show The Intricate Relations of Cause And Effect In Disease

"We Want a Critical Investigation of Skin Diseases, in their Relation with Diseases of Other Organs. Are Diseases of the Kidney, or of the Liver frequently productive of them? And, if so, what are the peculiarities of such? Which are in Special Relation with the Nervous System? Are Diseases of the Intestinal, or Pulmonary Mucous Membranes Frequently Associated with those of the Skin?

There is another important direction in which work is wanted. We refer to the Anatomical seats of Morbid Processes. The Germans have recently been zealous in this matter, at least so far as microscopic investigation is concerned; but there are yet many points not cleared up; and some observers are quite content to speak of a papule, pimple, or tubercle, as if developed in the epidermis like a molehill in a field, without one special reference to structure. Others assign **a very important position to the sebaceous Glandular System, and hold that these little glands are very liable to be attacked by Inflammation from a variety of causes;** and that, in many very different maladies, the eruption has its starting-point in them. **Acne, Molluscum (small raised bumps), and Milium (cyst) have long been known to be thus placed; but there are those who believe that in the eruptions of lichen, measles, scarlet fever, variola, boils, Ecthyma, Impetigo, etc., the Inflammation commences in Sebaceous Glands** (located in the mid-dermis and almost always develop alongside a hair follicle, with an outlet emptying into the follicular canal).

We known that Season (temperature changes) influences these maladies.

When the diseases of the outer investment of the body (Skin) have been more thoroughly investigated, they will assume a very important place in relation to general medicine. It will be acknowledged that these maladies offer to the clinical teacher the very best material by which to show the Intricate Relations of Cause and Effect in Disease, to illustrate the great varieties in the Inflammatory Process." - in "British Medical Journal", 22 January 1870.

"The Skin, The Organ Which Is Often Held To Be A Mirror Reflecting Changes In Other Parts of the Body." *- in "Pills, Profits, and Politics", 1974.*

> ***"All The Cases Had Mental Symptoms; but the other symptoms of each case were either Digestive or Skin. This suggests that there may be an Alternation of Skin and Digestive Symptoms Similar to the Alternation we find with Asthma and Skin."*** *- Dr Lees, MD, in "The Role of Bowel Flora in Chronic Disease", British Homeopathic Journal, January 1949.*

> ***"If The Cause Maintaining The Disease Still Persists. Some circumstance is to be found in the regimen or the environment of the patient which Must Be Eradicated If The Cure Is To Permanently Come To Pass."*** *- Dr Samuel Hahnemann, MD, in "Organon of the Medical Art", 1755.*

Our Women Never Die in Childbirth, They Do Not Allow Medical Doctors to Attend Them on Such Occasions

"The horse, the dog, the ox, and others of the brute creations, we are assured by the breeders of those animals, **are but little subject to the fatal diseases of the lungs and others of the respiratory or digestive organs; nor to diseases of the spine, to Idiocy or Deafness; and their teeth continuing to perform their intended functions to the close of natural life.**

Not 1 in a 100 of these animals, with Proper Care, and a Sufficiency of Food, would fail to reach that period, unless destroyed by intention or accident.

Mankind are everywhere a departure from this Sanitary condition, though the Native Races often-times present a near approach to it, as **I have witnessed amongst the Tribes of North, and South America, amongst whom, in their primitive condition, the above-mentioned diseases are seldom heard of; and the almost unexceptional regularity, beauty, and soundness of their teeth last them to advanced life and old age.**

In civilized communities, better sheltered, less exposed, and with the aid of the ablest professional skill, the Sanitary condition of mankind, **with its variety, its complication and fatality of diseases; its aches and pains, and mental and physical deformities, presents a more lamentable and mournful list, which plainly indicates the existence of some extraordinary, latent cause, not as yet sufficiently appreciated, and which it is the sole object of this little work to expose.**

I advise you to bear in mind the awful Bills of Mortality amongst civilized societies, which I have quoted; **and realize the dangerous race which civilized man runs in life (how very few live to the age designed by God), how many perish in infancy, long before they are of your age; and consequently the**

dangers which you have already passed, and contrast all of these with those of the Wild Indians, who by God, are no stronger than we are, but who Generally Live to a Good Old Age, with comparatively few bodily pains in life, and their teeth almost uniformly regular and sound, without the aid of Dentists and tooth-brushes.

An Indian child is not allowed to sleep with its mouth open, from the very first sleep of its existence; the consequence of which is, that while the teeth are forming and making their first appearance, they meet (and constantly feel), each other; **and taking their relative, natural positions, form that healthful and pleasing regularity which has secured to the American Indians, as a Race, perhaps the Most Manly and Beautiful Mouths in the World.**

Healthy Living Makes No Derangements or Deformities in Teeth or Mouths

Healthy Living Makes No Derangements or Deformities in Teeth or Mouths; but bad habits or accidents produce the disagreeable derangements of the one, and consequently the disgusting expressions of the other, which are so often seen.

Amongst 2 Millions of these wild people whom I have visited, I never saw, or heard of a Hunch-Back (crooked spine), though my inquiries were made in every tribe; nor did I ever see an Idiot, or Lunatic amongst them, though I heard of some 3 or 4 during my travels, and perhaps of as many Deaf and Dumb.

Shar-re-tar-rushe, an aged and venerable chief of the Pawnee-Picts, a powerful tribe living on the head-waters of the Arkansas River, at the base of the Rocky Mountains, told me in answer to questions:

"We very seldom lose a small child, none of our women have ever died in childbirth (they have no medical attendance on these occasions), we have no Idiots or Lunatics, nor any Deaf and Dumb, or Hunch-backs, and our children never die in teething."

This Tribe I found living entirely in their primitive state; their food Buffalo flesh and Maize, or Indian corn.

Ski-se-ro-ka, chief of the Kiowas, a small Tribe, on the head-waters of the Red River, in Western Texas, replied to me: "My wife and I have lost 2 of our small children, and perhaps 10 or 12 have died in the tribe in the last 10 years, we have lost none of our children by teething, **we have no Idiots, no Deaf and Dumb, nor Hunch-Backs."** This Tribe I found living in their primitive condition, their food Buffalo flesh and venison.

Cler-mont, chief of the Osages, replied to my questions:

"Before my people began to use "fire-water" (whiskey), it was a very unusual thing for any of our women to lose their children; but I am sorry to say that we lose a great many of them now; we have no Fools (Idiots), no Deaf and Dumb, and no Hunchbacks, our women never die in childbirth nor have dead children."

Naw-kaw, chief of the Winnebagoes, in Wisconsin, the remnant of a numerous and warlike tribe, now semi-civilized and reduced:

"Our children are not now near so healthy as they were when I was a young man; it was then a very rare thing for a woman to lose her child; now it is a very difficult thing to raise them," to which his wife added "since our husbands have taken to drink so much whiskey our babies are not so strong, and the greater portion of them die; we cannot keep them alive."

The chief continued:

"We Have No Idiots, No Deaf and Dumb, and No Hunch-Backs; Our Women Never Die in Childbirth, and they Do Not Allow Medical Trade Doctors to attend them on such occasions." - in "The Breath of Life", 1862.

Know This First

> ***"Who hath put wisdom in the inward parts? or who hath given understanding to the heart?"*** *- Job 38:36*
>
> ***"Modern scientific research has placed upon a sure foundation the great truth (dimly recognized by the earliest physicians, but wholly lost sight of during the dark ages): That Healing Power Is Not Possessed By Physicians, Nor By Remedies, but that the Curative Process Is Simply a Manifestation of The Forces Which Dwell Within the Body, and Which are Normally Manifested in Creating and Maintaining the Organism. In Other Words: THE BODY HEALS ITSELF!***
> ***WATER: Applied Externally or Internally, and at Such Temperatures As May be Required; Is An Agent Which More Fully Than Almost Any Other Co-Operates with the Healing Powers of the Body, in Resisting the Onset and Development of Pathogenic Processes. There Is No Other Remedy By Which the Movements of the Blood, and the Blood Supply, both general and local, and in fact every form of Vital Activity, May Be So Readily Controlled as by Hydriatic Applications."*** *- Dr John Harvey Kellogg, MD, in* ***"Rational Hydrotherapy: a Manual of the Physiological and Therapeutic Effects of Hydriatic Procedures, and the Technique of their Application in the Treatment of Disease"****, 1918.*
>
> ***"First Remove the Cause, and then Assist Nature to Restore the patient to Health."*** *- in "New York Medical Journal", 16 October 1897.*

Emunctology, more than a Profession it is a Vocation.

The Aim is not driven to acquire fame or fortune.

The Aim is ever to be of Service. To be Good, to be Useful, to Aid those that SEEK, not those who don't seek rather those that SEEK.

For Emunctology is not Medicine, its not part of the Medical Trade.

For Medical Science: To be correctly defined is that which is Untrue, and in its Nature; Dubious and Treacherous, thus, that which is beneath, or lower life.

"I believe God's light protects me in all my work and it touches those I lay my hands upon. I am simply a natural born healer and a channel for God's Healing Energy.
I know of whose sole purpose is to do good and ease others suffering." *- in "My Life as a Healer", 1999.*

Healing is Voltage

"The recognition that all matter is energy forms the foundation for understanding how human beings can be considered dynamic energetic systems. Through E = mc 2, "Mass and Energy are both but different manifestations of the same thing"- Albert Einstein, proved that energy and matter are dual expressions of the same universal substance. That universal substance is a primal energy or vibration of which we are all composed." *- Dr Richard Gerber, MD, in "Vibrational Medicine", 2001.*

The Human Body is made up of Electronic Vibration, with each atom, and element of the body, each organ and organism of the Body, having its Electronic, or Unit of Vibration: necessary for the sustenance of, and equilibrium in, that; particular organism.

"The quantum mechanisms how life efficiently utilises energy and transmits information: Frequency Medicine, an emerging cross-discipline of both quantum mechanics and Biomedicine, is a promising turning point, from the Matter Level, to the Energy Level. Recognizing the pivotal role of Molecular Vibrational Frequencies in resonant energy coupling, and transmission; underscores the potential of frequency to precisely regulate biomaterial vibrations, influencing interactions and reactions in living organisms. According to Hippocrates: "the best doctor on earth is the sun." Finsen successfully Cured Smallpox lesions and lupus-related skin infections using Red Light and Violet Light. Dr Mester first found the anti-inflammatory and analgesic effects of laser, which opened the commencement of widespread application and research of laser therapy. The "Precious Essential Formulary for Emergency", by Simiao Sun, 652 AD, records that powdered magnets can be used to treat cold sores. Music Can Cure Diseases. The Therapeutic Effects of Music were first systematically described in Musical Medicine, by the physician Brow in the early 19th century. Hippocrates also said: "If there were a way to heat bones, then all diseases can be treated." In recent years, Photothermal Therapy has emerged as an Effective Means for Treating Tumors. According to quantum theory, Matter is Composed of Rotating Particles with Different Vibrational Frequencies, Its Essence Is Energy. The human body can be considered as a Frequency Assemblage." *- in "Spatiotemporal omics of life energy", MedComm – Biomaterials and Applications, January 2024.*

Healing Through Music

"If you will sing and praise and pray. First sing in your soul; then with your voice. So we lay down the metaphysical. This is a creative law, through the vibrations of the voice joined with high thinking, every cell in the body is set into action, and not only in the body but out into the environing thought atmosphere the vibrations go and break up all crystallized conditions.

The Universe Is In Vibration

The Whole Universe Is In Vibration, and that vibration is under law. Each particular thing has its rate of vibration. Heat, light, and color are different rates of vibration in one field of primal energy. Different colors are caused by the different frequencies of the vibrations as they strike the eye. But what causes vibration? Mind. The cells of the body are centers of force in a field of universal energy. There are no solids. That which appears solid is in reality the scene of constant activity. The eye is not keyed to the pulsations of this universal energy and is therefore deceived into believing that things are solid.

All Energy and Life are governed by laws of spiritual harmony.

The Mind

If the mind that receives sound vibrations is in spiritual consciousness, the body responds to the higher activity. If our mind were trained to think thoughts that harmonized with Divine Mind, we could hear the music of the spheres.

You can drive away the gloom of disappointment by resolutely singing a song. Cultivate the power of music in connection with the understanding of Truth, and thus rend all the bonds of sin, sickness, and death.

New Hymnal With Words of Truth

The world needs a New Hymnal, with Words of Truth only and music so strong and powerful that it will penetrate to the very center of the soul.

Our body is now tuned to the divine harmony; we shall find the keynote by listening in the Silence to the singing soul. The new life in Christ fills me with zeal to live, and I am healed. In putting on Christ (developing the supermind), every faculty has to be raised to supermind proportions. The exact mathematical degree of power necessary to Synchronise Oneself with the Kingdom of the Heavens in which the supermind functions has not been revealed to human consciousness, if indeed it can be. A British Astronomer Sir James Jeans says that he has discovered that God is a Great Mathematician.

> ***"The Great Architect of The Universe now begins to appear as a pure mathematician. If we spin a half-penny, nothing within our knowledge may be able to decide whether it will come down heads or tails. Yet if we throw up a million tons of half-pence, we know there will be 500,000 tons of heads and 500,000 tons of tails. The experiment may be repeated indefinitely, and will always give the same result. We may be tempted to instance it as evidence of the uniformity of nature, and to infer the action of an underlying law of causation; in actual fact it is an instance only of the operation of the purely mathematical laws of chance. Today there is a wide measure of agreement, which on the physical side of science approaches almost to unanimity, that the stream of knowledge is heading toward a non-mechanical reality; the universe begins to look more like a great thought than a great machine. Mind no longer appears as an accidental intruder into the realm of matter; we are beginning to suspect that we ought rather to hail it as the creator and governor of the realm of matter. Not, of course, our individual minds, but the mind in which the atoms, out of which our individual minds have grown, exist as thoughts."*** *- Sir James Jeans, British Astronomer, in "The Mysterious Universe", 1930.*

The logical conclusion of all wise philosophers is that: "Everything in the universe both seen and unseen is under mathematical law."

> ***"Even the very hairs of your head are all numbered."*** *- Luke 12:7*

Our minds determine the character of our words and what the mind determines the mouth obediently utters, its words loaded with constructive or destructive electrons all mathematically arranged to build up or blow up both ourselves and our aims and ideals. The beginning of the culture of the mind that enables it to make contact with the realm of creative ideas is faith. When we know that every word is mathematically linked with certain creative ideas and that Divine Mind has made it possible for every one of us to draw upon these ideas mentally, we have the key to all creative processes. I am at peace because I trust divine justice to regulate my mind, body, and affairs. Man's whole character is determined by the thoughts for which he allows a place in his mind. The Mind of Spirit is harmonious and peaceful, and it must have a like manner of expression in man's consciousness. Neither can man reflect the steady strong glow of Omnipotence when his mind is disturbed by anxious thoughts, fearful thoughts, or angry thoughts. Be at peace and your unity with God-Mind will bring you health and happiness." Charles Fillmore, in "Jesus Christ Heals", 1939.

"Every cell in the body is designed to run at -20 to -25 millivolts. To Heal, We Must Make New Cells. To make a new cell requires -50 millivolts. Dr Robert Becker, MD, Orthopedic Surgeon, discovered that we have an entire second nervous system made of fibrous tissue surrounding our nerves. He named this "The Analog Perineural Nervous System." The nerve-impulse nerves of the brain and body are digital. That means that information is in discrete steps of on/off. It is sensitive to the frequency of the signal. It controls the conscious mind, and the autonomic nervous system (automatic control of blood pressure, breathing, etc.). The second nervous system of the body is the perineural system of glial cells and Schwann cells, etc., that surround the other nerves. It is an analog system, meaning continuously variable strength of signal, direction of flow, and waves of strength. It controls growth, healing, and biological cycles.

Where it was always thought that the fibrous tissue of the body serves only as structural support, Becker and Nördenstrom showed that fibrous tissue in the body also serves to conduct electrons, much like copper wire in our homes.

> ***"Loss of energy is the origin of pathologic processes. Reverse the process, restore energy, and health will result. Health is the result of normal energy interchange. Disease is the result of abnormal energy function. The problem then becomes how best to restore and maintain normal energy flow. Dr Taylor has also stated positively that manipulative pressure and stretching are the most effective ways of modifying the energy potentials of abnormal tissues."*** *- in "The Journal of the American Osteopathic Association", 1968.*

> ***"We have natural signatures. We all emit. And each cell resonates at a different frequency. We are Energetic Beings. It's all Voltage; pH is Voltage, too."*** *- Dr Carrie Madej, DO, in "The Shawn Johnson Podcast", 13 January 2026.*

The Importance of pH

You will recall that I began my journey toward getting well by recognizing that cells are designed to run between a pH 7.35 and pH 7.45.

I also began my journey with the idea that if I could figure out how to make one cell work I could make them all work. I want to focus on the importance of pH. When I was trying to figure out how to get well, I couldn't remember a lot about pH. I remembered that it was something about acid/base balance. So I began to read about pH. What I discovered is that pH (Potential Hydrogen) is really a measurement of voltage.

One can see that a pH of 7.35 is the same as a voltage of −20 mV. A pH of 7.45 is the same as a voltage of −25 mV. Thus we see that all cellular biology texts tell us that cells are designed to run between −20 and −25 millivolts of electron donor status! Electron stealers cause damage, are a pH from 0 to 6.9, are acidic, are free radicals, are the positive pole, are destructive, and at the atomic level spin left. You will hear statements such as “all disease occurs when you are acidic.” What this is really saying is that all disease occurs when your voltage is low or in an electronic stealer state.

pH Between 7.35 & 7.45

You will hear statements such as “Alkalize or Die.” What this means is that; you must have electrons available to do work or your cells will die. An antioxidant is a molecule capable of giving away electrons. Thus when your mother says: “eat your vegetables”; she is saying that the vegetables contain electrons that are good for you. We maintain our health and heal primarily by making new cells. To make a new cell requires a voltage of −50 mV. Chronic disease is always defined by having low voltage.

Water

Several bad things happen when Voltage drops. The obvious one is that organs simply don’t have enough horsepower to do their job. Another is that they don’t have the energy to get rid of Toxic Waste, which begins to accumulate. Remember that at -50 mV, there is a pulsing pain. When you have low voltage, it simply hurts all the time. Thus pain is simply a symptom of abnormal Voltage. You correct it by correcting the voltage. If you put a tube into a glass of Water and began bubbling Oxygen into the Water, the amount of Oxygen that will dissolve in the Water is dictated by the Voltage of the Water. As voltage is raised, more Oxygen will dissolve in water. However, as Voltage drops, Oxygen comes out of solution and leaves the Water. Our cells are 75% Water. Thus it is the basis of who you are and how healthy you are. The cells are composed of water, it is also what the body uses to wash itself internally; to clean away. Thus as voltage begins to drop in us, Oxygen leaves the cells. This has serious consequences. Water from the ground contains electrons. We call this “Alkaline Water.” However, when chlorine and fluoride are placed in the water, it turns into an electron stealer. Thus every time we drink such water, it steals electrons from us.

The water we should be drinking should contain electrons and be clean and free from Toxins.

> ***"The Main Function of the Cardiovascular System; is to deliver a sufficient quantity of Oxygenated Blood to the tissues, cells, and organs of the body in order to provide the cells with essential Nutrients for metabolism, and for the Removal of Waste Products. All cells require and utilize Oxygen. Oxygen is transported to various cells and tissues via Red Blood Cells flowing through the Microcirculation of an organism."*** *- in "Effects of Light Exposure on the Release of Oxygen from Hemoglobin in a Red Blood Cell Suspension", 2008.*

Oxygen

Oxygen is an important element in the the metabolic process of the body system. It is fundamental to speed up, and resolve among other functions the: Regeneration of Body Tissue. What then; are the Physiological Aspects of Oxygen in the System? When Oxygen is available, for every unit of fatty acids run through the Krebs cycle, we create 38 molecules of Adenosine Triphosphate (ATP), nucleoside triphosphate that provides energy to drive and support many processes in living cells. However, if Oxygen is unavailable, only 2 molecules of ATP are created for every unit of fatty acids. Thus as Voltage drops, and Oxygen levels drop, our Metabolism goes from "61 kilometres per 4 litre, to 3 kilometres per litre." Thus it is very difficult for cells to have enough energy to function with such inefficient metabolism. Another problem of decreased Oxygen is infections. Our bodies contain 30 to 40 Trillion Microorganisms. However, most of these Microorganisms Are Inactive; As Long as Oxygen Is Present. However, When Oxygen Levels Drop, These Microorganisms Wake Up. The first thing they want to do is have lunch. And they want to have you for lunch.

Toxins

One must also have the raw materials necessary to make new cells, and to eliminate the toxins or infections present that will damage the new cells.

Medical Trade Medication

Most Pharmaceuticals and Surgery; speak to eliminating symptoms, but do not speak to healing. Absence of Symptoms, is not the same as Healed and Healthy. You can take all of the medications you like and do as much surgery as you like, but you will not heal unless you have −50 mV, raw materials, and lack of toxins." - Dr Jerry L. Tennant, MD, in "Healing is Voltage", 2014.

The Warburg Hypothesis

Otto Heinrich Warburg, Physiologist, Was nominated for the award 47 times.

In 1931 received the Nobel Prize in Physiology or Medicine for "discovery of the nature and function of the respiratory ferment."

"Cancer, above all other diseases, Has Countless Secondary Causes. But, even For Cancer, There Is Only One Prime Cause. The Prime Cause of Cancer Is The Replacement of the Respiration of Oxygen in normal body cells By a Fermentation of Sugar. All normal body cells meet their energy needs by respiration of Oxygen, whereas cancer cells, meet their energy needs in great part by Fermentation. From the standpoint of the physics and chemistry of life, this difference between normal and cancer cells is so great that we can scarcely picture a greater difference. Oxygen Gas; the donor of energy in plants and animals, is Dethroned in the cancer cells and replaced by the Fermentation of Glucose. All Cancer Cells, Without Exception: Must Ferment, and no normal growing cell ought to exist that ferments in the body. Cancer metabolism has now been induced artificially in body cells by the simplest conceivable experimental procedure. If one provides an Oxygen pressure so reduced that the Oxygen respiration is partially inhibited, the purely aerobic metabolism of cells is quantitatively altered within 48 hours. Oxygen pressures that inhibit respiration 35% can occur at the end of blood capillaries in living animals so that the possibility arises that cancer may result when too low Oxygen pressures occur. De-differentiation begins at once when respiration is inhibited in any way. There exists no alternative.

It Is The First Precondition of the Proposed Treatment that All Growing Body Cells be Saturated With Oxygen. To Prevent Cancer It Is Therefore Proposed:

1. To keep the speed of the bloodstream so high, that the venous blood still contains sufficient Oxygen.
2. To keep high the concentration of hemoglobin in the blood.
3. To add always to the food, even of healthy people, the active groups of the respiratory enzymes, and to increase the doses of these if a pre-cancerous state has already developed. If at the same time, exogenous carcinogens are excluded rigorously, then most cancers may be prevented.

These proposals; may be realized by everybody, everywhere, at any hour. The prevention of cancer, requires no government help and no extra money. Nobody today can say that one does not know what cancer, and its prime cause be.

> ***On the contrary, there is no disease whose prime cause is better known so that today, ignorance is no longer an excuse. How long prevention will be avoided depends on how long the prophets of agnosticism will succeed in inhibiting the application of scientific knowledge in the cancer field. In the meantime, millions of men must die of cancer unnecessarily. If one puts embryonic mouse cells into a suitable culture medium saturated with physiological Oxygen pressures, they will grow outside the mouse body, in vitro, and indeed as pure aerobes, with a pure Oxygen respiration, without a trace of fermentation. However, if during the growth one provides and Oxygen pressure so reduced that the Oxygen respiration is partially inhibited, the purely aerobic metabolism of the mouse embryonic cells is quantitatively altered within 48 hours, in the course of 2 cell divisions, into the metabolism characteristic of Fermenting cancer cells."*** *- Dr Otto H. Warburg, MD, in "On the Origin of Cancer Cells", Science, 24 February 1956; "The Prime Cause and Prevention of Cancer", August 1966.*

Warburg hypothesized (Warburg Hypothesis) in 1930 that a Disturbance / Interruption in the function of mitochondria in cancer cells; was the main reason for the growth of cancer. The Warburg Effect", refers to the high rate of glycolysis cancer cells use even with Oxygen, and the related phenomenon of voltage-dependent anion channels; playing a role in limiting mitochondrial metabolism within these cells. This disruption could be measured electrically: A normal, fully functional cell has a charge of -70 to -90 millivolts at birth.

Over time, this cell charge decreases to -50, and -35mV. Sick cells and cancer cells, have a charge of -20mv to -15mv. This means that each cell has a small electric pump inside it, that brings food into the cell, and removes Toxins (both metabolic and waste products). In his classic treatise The Prime Cause and Prevention of Cancer, Warburg proposed that an improper utilization of minerals and vitamins and a toxic physical state might contribute to a lowering of Oxygen in the body's cells with the ultimate result being cancer.

Over time (if the body is not kept cleansed), the cell's ability to perform its tasks is compromised when so much waste and toxins accumulate in it (Auto-Intoxication: Toxaemia). Thus at some point, it will fail.

> ***"Cancer cells rewire their metabolism to promote growth, survival, proliferation, and long-term maintenance. The common feature of this altered metabolism is increased glucose uptake and fermentation of glucose to lactate. This phenomenon is observed even in the presence of completely functioning mitochondria and together is known as the Warburg Effect. The Warburg Effect has been documented for over 90 years and extensively studied over the past 10 years with thousands of papers reporting to have***

> ***established either its causes or its functions. Extensive research on the Warburg Effect and its functions in cancer cells have advanced our understanding of its causes and requirements for tumor cell proliferation."*** *- in "The Warburg Effect: How Does it Benefit Cancer Cells?", Trends Biochem. Sci.", March 2016.*
>
> ***Adenosine Triphosphate (ATP) a nucleotide triphosphate that provides energy to drive and support many processes in living cells, such as muscle contraction, nerve impulse propagation, and chemical synthesis. Found in all known forms of life, it is often referred to as the "molecular unit of currency" for intracellular energy transfer.***

"Energy Is Necessary For Tumor Cell Viability and Growth.

Aerobic glucose-driven lactic acid fermentation is a common metabolic phenotype seen in most cancers including malignant gliomas.

This metabolic phenotype is linked to abnormalities in mitochondrial structure and function.

A luciferin-luciferase bioluminescence ATP assay was used to measure the influence of amino acids, glucose, and Oxygen on Adenosine Triphosphate (ATP) content and viability in mouse (VM-M3 and CT-2A), and human (U-87MG) glioma cells that differed in cell biology, genetic background, and species origin. Oxygen consumption was measured using the Resipher system.

Extracellular lactate and succinate were measured as end products of the glycolysis, and glutaminolysis pathways, respectively.

The Results Showed that:

1. **Glutamine was a source of ATP content irrespective of Oxygen. No other amino acid could replace glutamine in sustaining ATP content and viability;**
2. **ATP content persisted in the absence of glucose and under hypoxia, ruling out substantial contribution through either glycolysis or oxidative phosphorylation (OxPhos) under these conditions;**
3. **Mitochondrial complex IV inhibition showed that oxygen consumption was not an accurate measure for ATP production through OxPhos.**

The glutaminase inhibitor, 6-diazo-5-oxo-L-norleucine (DON), reduced ATP content and succinate export in cells grown in glutamine.

The data suggests that mitochondrial substrate level phosphorylation in the glutamine-driven glutaminolysis pathway contributes to Adenosine Triphosphate (ATP) content in these glioma cells.

A new model is presented highlighting the synergistic interaction between the high-throughput glycolysis and glutaminolysis pathways that drive malignant glioma growth and maintain ATP content through the aerobic fermentation of both glucose and glutamine.

We also found that ATP content through OxPhos alone was unable to maintain bioluminescence of glioma cells in the absence of glucose and glutamine, indicating that these metabolites are both necessary and sufficient for maintaining growth of these glioma cells.

A new metabolic model is presented highlighting the synergistic interaction between the high-throughput glycolysis and glutaminolysis pathways that converge on anabolic intermediates and maintain Adenosine Triphosphate (ATP) content through the aerobic fermentation of both glucose and glutamine.

Finally, the findings from this study can provide a general mechanism explaining the therapeutic efficacy seen from in vivo studies where the simultaneous restriction of glycolysis and glutaminolysis under nutritional ketosis enhance survival of young and adult mice bearing malignant brain tumors (Mukherjee et al., Citation2019; Citation2023; Seyfried et al., Citation2021; Citation2022)." - in **"Amino Acid and Glucose Fermentation Maintain ATP Content in Mouse and Human Malignant Glioma Cells"**, SN Neuro 2 December 2024.

Clarity on the Warburg Effect

> ***"Otto Warburg discovered that tumours consume tremendous amounts of glucose relative to most non-transformed tissues, and that the majority of glucose consumed by tumours is fermented to lactate, rather than oxidized in pathways that require respiration. This phenotype is referred to as "aerobic glycolysis," because unlike carbohydrate fermentation in response to oxygen limitation, aerobic glycolysis involves high levels of fermentation even when oxygen is abundant.***
>
> ***Aerobic glycolysis a hallmark of proliferative metabolism found across many kingdoms of life, but is frequently associated with cancer cells, and is known as the Warburg effect in this context. Aerobic glycolysis reflects a metabolic state in which the demand for Nicotinamide Adenine Dinucleotide (NAD+ an essential coenzyme involved in hundreds of cellular processes including energy metabolism), for oxidation reaction supersedes the cellular demand for Adenosine triphosphate*** *(ATP a nucleoside triphosphate that provides energy to drive and support many processes in living cells)." - in "New Clarity on the Warburg Effect", Frederick National Laboratory for Cancer Research, National Cancer Institute, 13 January 2021.*

NAD+ is a crucial coenzyme that helps generate ATP, the energy currency of the cell. During metabolic processes like glycolysis and the citric acid cycle, NAD+ accepts a hydride (H−) and 2 electrons to become NADH.

NADH then carries these electrons to the electron transport chain, where the energy they release is used to synthesize large amounts of ATP through oxidative phosphorylation. ATP is also necessary for cellular processes, including a step in the production of NADP+ from NAD+.

The relationship between NAD+ and ATP is a cycle of energy conversion and regulation. NAD+ acts as a mobile electron carrier, transferring energy harvested from food molecules to the ATP-generating machinery in the mitochondria.

Conversely, ATP provides the energy needed to convert NAD+ to NADP+.

This interdependency ensures cells can effectively produce and use energy.

Human Energy Field

"Physiology Interacts with its environment via Ambient Fields such as:

1. **Light.**
2. **Sound.**
3. **Electricity.**
4. **Magnetism, and with all other living organisms to generate massive amounts of information in the form of;**
5. **Energy Fields.**

Voltage Potentials (VPs) across cell membranes direct ion flux, modulating cell function. Voltage Potentials are involved in the therapeutic effects of Pulsed ElectroMagnetic Field (PEMF) on immune function and tissue regeneration, on organ-associated frequencies instrumental in the Endocrine Systems, and on the regulatory mechanisms of neurotransmitter conversion of external fields into chemical or electrical energy involved in mind–body function known as PsychoNeuroImmunology (PNI).

The subtle energies involved in these systems exhibit the internal and external aspects of the human being described as the Human Biofield, or Human Energy Field (HEF). Quantum Physics teaches us there is no difference between energy and matter. All systems in an organism, from the atomic to the molecular level, are constantly in motion-creating resonance.

This resonance is important to understanding how electromagnetism (radiation/light) can have different effects on the body.

Cerebral Spinal Fluid carries information that affects the:

1. **Endocrine System.**
2. **Immune System.**
3. **Central Nervous System (CNS).**
4. **Sympathetic Nervous System (SNS).**
5. **Parasympathetic Nervous System (PNS).**

Research suggests that: the Mind, and Body Communicate in a Bidirectional Flow of Hormones; Neuropeptides and Cytokines.

Electro-Therapy is the use of known Subtle Energy Fields; to Therapeutically Assess and Treat Energetic Imbalances, bringing back to Homeostasis the Body's Systems:

1. **Neurological.**
2. **Cardiovascular.**
3. **Respiratory.**
4. **Skeletal.**
5. **Endocrinal.**
6. **Emotional/psychological.**

Knowledge of the existence of the Human Energy Field, Is The First Step to Understanding Integral Physiology, which Unites: Body, Mind, and Spirit; to Treat the Entire Human Being; not just the physiology. Disturbances in the coherence of energy patterns of the Human Energy Field are indications of disease, and aging. Human beings are composed of information (energy) interacting with other energy (environment) to profoundly impact our Physical and Emotional Health. The Human Energy Field has been investigated in scientific laboratories where photon emissions were detected using photometers and colour filter. Human Energy Vibrations were recorded at 1,000 times higher in frequency than the electrical signals of nerve and muscle, with continuous dynamic modulation unlike the pulsing signals of the nervous system.

Energy in the Human Energy Field is typically referred to as Subtle Energy, which is Electro-Magnetic In Nature. It is a system of wave-particle matter, transmitting and receiving vibrational information governing the physical matter of the body. Healing is achieved by directing coherent, harmonic energy into distortions caused by stressors and disease. Biochemistry, is based on an understanding of the flow of energy that drives chemical reactions.

Physical properties of molecules can be combined to express internal energy and thermodynamic potentials, which are necessary for Equilibrium, and Homeostasis in spontaneous processes.

Parameters of these Fields include: Frequency, Amplitude (Field Strength), Waveform, and Time of Exposure. Recognition of physiological sensitivities to exogenous Electromagnetic Field came from the observation of internal endogenous electrical processes. An example of this is the piezoelectric properties of bone that use electromechanical control to determine which cells become osteoblasts or osteoclasts. By modulating cellular processes with Pulsed ElectroMagnetic Field, windows of opportunity for therapeutic application have been discovered for improving the regeneration of osteoblasts to bone before becoming osteoclasts.

All cells produce Electromagnetic Fields because the human body produces complex electrical activity in all the body's 210 different cell types. Neurons, Endocrine cells, and muscle cells are all referred to as "excitable cells."

These cells produce current (via electron transfer); magnetic field (via moving charges); a pulsed frequency; as well as pH, Oxygen, carbon dioxide, and light (via Biophotons). Detailed clinical research in biophysical stimulation has identified specific cellular processes responding to Electromagnetic Forces.

Selective pathways at the Cell Plasma Membrane are activated depending on the Pulsed ElectroMagnetic Field applied.

These include voltage-gated Calcium channels activated by capacitive coupling, intracellular Calcium flux modulated with inductive coupling, and inositol phosphate by mechanical stimulation.

Basic research on cells, animals, along with clinical studies have reported therapeutic dosimetries for frequency, amplitude (field strength), waveform, orientation, and time of exposure needed to activate specific processes in specific cells.

Processes activated by Pulsed ElectroMagnetic Field signals have been reported in the Plasma Membrane's Cell surface receptors through the cytoplasm into the nucleus and genes, where transcription factors affect translation of cell function. Externally applied Electromagnetic Field, can affect orientation, migration, and proliferation of cells, Playing Key Roles In Healing.

Research shows Pulsed ElectroMagnetic Field at Extra Low Frequencies (ELFs) is beneficial to immune system modulation, as well as tissue regeneration. Pulsed ElectroMagnetic Field can pass through the skin into the body's conductive tissue, resulting in reduced pain and edema, and stimulation of wound healing after trauma.

Electromagnetic Therapies can affect cell signaling systems through the modulation of cytokine function, second messengers such as cyclic adenosine monophosphate, transcription factor nuclear factor kappa B, and tissue regeneration, without cytotoxic or genotoxic effects.

EMFs oscillate at various frequencies, however, Extra Low Frequencies (<100 Hz) are most commonly used for therapeutic purposes.

Touch therapies work using touch, interaction, and certain protocols to modulate energy imbalances in the Human Energy Field.

The subtle energy of the Human Energy Field is easily modulated by the Therapist's Hands. The client and practitioner work together using breathing techniques to move stagnant or blocked energy from the cells, across the tissues and through the organs. Human touch therapies are patient–practitioner oriented, where both the giver and receiver of the energy treatment must work in tandem for beneficial results to occur. The practitioner grounds and centers himself, meaning all thoughts, emotions, and physical sensations are neutralized. During optimal healing states, our bodies resonate at certain frequencies (0.3–100 Hz), which correlate with delta, theta, alpha, and beta brain waves.

Cellular Voltage Potentials (VPs)

The human body is controlled primarily by physics that drives the chemistry and biology. Therefore, to understand how the body works, it is important to understand physics and electronic applications of cellular structure.

Endogenous VPs control cell behavior and instruct pattern regulation in vivo.

Cells are designed to operate with a pH between 7.35 and 7.45.

This equates to a voltage of between #20 and þ125 mV.

The minus (#) sign denotes electrons are being donated (alkaline), and the plus (þ) sign denotes electrons are being taken (acidic). A Slightly Alkaline Environment Is More Beneficial. For example, a free radical is a molecule with missing electrons, and an antioxidant is a molecule donating electrons.

Health is maintained with vital immune function and cell regeneration.

A voltage of #50 mV is required for regenerating cells.

Dr Jerry Tennant, MD, reports that a #50 mV energy state is necessary for maintaining good health, and #70 mV is optimal.

Without this balanced Voltage Potential, aging and chronic disease occurs.

This baseline can be achieved through healthy diet and keeping the body's subtle energy balanced. Cells contain a process for turning fatty acids into glucose.

They are processed through a series of chemical reactions known as the Krebs cycle. The Pathway From The Physical Body through the hormones to the psychological and emotional body Is Through The Endocrine System.

The major glands of the Endocrine System are the hypothalamus, pituitary, thyroid, parathyroid, adrenal, pineal, and reproductive organs (generatives).

The pituitary cells are neuronlike; they express numerous voltage-gated sodium (Naþ), calcium (Ca2þ), potassium (Kþ), and chloride (Cl#) channels, and fire action potentials spontaneously, accompanied by a rise in intracellular Ca2þ.

In some cells, Spontaneous Electrical Activity Is Sufficient to drive the intracellular Ca2þ concentration above the threshold for stimulus-secretion and stimulus transcription coupling. In other cells, the function of these action potentials is to maintain the cells in a responsive state with cytosolic Ca2þ near, but below, the threshold level. Some pituitary cells also express gap junction channels, which could be used for intercellular Ca2þ signaling in these cells.

Endocrine cells also express extracellular ligand-gated ion channels, and their activation by hypothalamic and intrapituitary hormones leads to amplification of the pace-making activity and facilitation of Ca2þ influx and hormone release.

These cells also express numerous G protein-coupled receptors, which can stimulate or silence Electrical Activity and action potential-dependent Ca2þ influx and hormone release.

Other members of this receptor family can activate Ca2þ channels in the endoplasmic reticulum, leading to a cell type-specific modulation of Electrical Activity. These Same Physics Phenomena Are Seen In The other Glands of the Endocrine System. Once energy reaches a certain threshold, molecules begin to vibrate (resonate) in unison until they reach a level of coherence.

The moment molecules reach this state of coherence, they take on certain qualities of quantum mechanics, including nonlocality, where they operate in tandem.

This occurs in ion flux where the selectivity filter of ion channels exhibits quantum coherence, which is relevant for the process of ion selectivity and conduction; endocrine hormone secretion, where highly organized timing of Circadian Rhythms and daily control of hormone secretion achieves optimal biological functioning in health.

The Healing of a Patient must include more than the biology and chemistry of their physical body; by necessity, it must include the: Mental, Emotional, and Spiritual (energetic) aspects." - in "Energy Medicine: Current Status and Future Perspectives", Global Advances in Health and Medicine, 2019.

The Warburg Effect

> ***"The current study demonstrates that Near-Infrared Light inhibits proliferation in cancer cells but not in non-cancer cell. The proposed general mechanism, partially detailed in the literature of Photobiomodulation Action, Appears to Involve an Increase of Reactive Oxygen Species (oxygen-containing molecules that easily react with other components within a cell) production, which our data seem to confirm, and thus, could be operative in this senescence mode. This Mechanism Takes Into Consideration The Warburg Effect, where Cancer Cells Have A Greater Shift Towards Glycolysis (Glycolysis is the foundational metabolic pathway that breaks down glucose ($C_6H_{12}O_6$) into two molecules of pyruvate, generating energy in the form of Adenosine Triphosphate (ATP the primary energy currency of biological cells), and Nicotinamide Adenine Dinucleotide (NADH a coenzyme central to metabolism, found in all living cells. Nicotinamide Adenine Dinucleotide + Hydrogen, is the biologically active, reduced coenzyme form of vitamin B3 [niacin], found naturally in all living cells, it plays a fundamental role in cellular respiration, where it acts as an electron donor to generate energy Adenosine Triphosphate (ATP). Occurring in the cell's cytoplasm, it is the first stage of both aerobic and anaerobic respiration and functions without requiring oxygen), Leading to Increased Reactive Oxygen Species levels. The combination of the already elevated Reactive Oxygen Species levels in cancer cells and Photobiomodulation-induced Reactive Oxygen Species increase activates a signal cascade towards senescence and permanent cell cycle arrest as a stress response. This mitochondrial/Reactive Oxygen Species-based mechanism would support the well-described anti-inflammatory and wound-healing properties observed with Photobiomodulation."*** *- in "Selective induction of senescence in cancer cells through near-infrared light treatment via mitochondrial modulation", 21 June 2024.*

The Natural Interaction Between Living Matter And Photons

"Biophysicists have now shown that: There Exists A Crucial Natural Interaction Between Living Matter And Photons. This process is measurable at the cellular (bacterium) level. Other research has demonstrated that living systems are extraordinarily sensitive to extremely low-energy electromagnetic waves. This is to say, each kind of cell or microorganism has a specific frequency of interaction with the electromagnetic spectrum. In the 1870's, Dr Antoine Bechamp, MD, saw tiny motile bodies with his microscope which he named "microzymas." In the first third of the 20 century Dr Gunther Enderlein,

MD, Microbiologist, Researcher and Physician, saw these bodies and called them “endobionts.” Dr Wilhelm Reich, MD, in the late 1930's, saw a similar if not identical body which he named “bion.” There were others during this era.

Today in Sweden and in Canada the properties of these same living particles are being explored by researchers who have assigned names from their own imaginations. The various theories advanced by members of this group of researchers remain rejected or largely forgotten. Remarkably, they all used dark-field condensers, a known but uncommon practice.” - in “The Cancer Cure That Worked”, 1987.

Teeth and Your Health

“Rejuvenation is about attaining and maintaining superior health, and one important part of that process is removing toxins (that is, poisons) from our bodies. Dr Jerry Tennant, was among the first researchers to make links between the health of the teeth and the health of other organs in the body.

He points out that now all of medicine is beginning to recognize the Effects of Dental Infections on the Rest of the Body. However, few physicians know that Every Tooth Is Wired into an Acupuncture Meridian, and whatever happens to each tooth will affect its Meridian.

For example, the lower left molars, teeth 17, 18, 19 on the standard Tooth numbering chart, have Direct Relationships to:

- Sinuses.
- Lungs.
- Large Intestines (Colon).
- Heart.
- Circulatory System.

Dental Health and Whole Body Health

There are critical issues about Dental Health and Whole Body Health.

Infections in Teeth (which we call decay), cause canals and the bone around teeth to put out poisons called Gliotoxins (Mycotoxin: specifically an epipolythiodioxopiperazine, produced by various fungi, notably Aspergillus fumigatus), and Thioethers (Sulfides) that affect the meridian of the infection.

Further, some Dental Surgery Amalgam Materials are often Toxic.

Mercury (for example): is one of the Most Poisonous substances known.

Nickel: common in Crowns and Braces, is Toxic to the Brain.

And these Substances Continue to be used in Dental Practices.

In terms of Dental health, Dr Tennant makes the case that Root Canals are Dead Tissue; and Dead Tissue Always Gets Infected, and is to be Avoided.

Further, it's not unusual to find mixed metals in the mouth, for example:

1. Mercury
2. Silver
3. Gold

Extensive Research shows that the: Electro-Magnetic frequency of metals differs from that of a Healthy Human Frequency; and Mixed Metals in an Acid or Alkaline Solution Create what is in simple terms a Battery Effect.

The Consequence is a Chemical Reaction in the mouth, that may be Linked to Deterioration of Health.

An Electrical System

> ***"If you take a quartz crystal and squeeze it with a pair of pliers, it will emit electrons. This is called the "piezoelectric effect." Our muscles are Piezoelectric Crystals. Thus when we exercise, our muscles create electrons. The muscles are also rechargeable batteries. Thus the movement of our muscles re-charges our muscle batteries. Exercise is a major way the body acquires electrons. There is a pump within the skull and down the spine called the Craniosacral Pump. Each time this pump activates, it sends a surge of electrons through the body."*** *- Dr Jerry L. Tennant MD, in "Healing is Voltage", 2014.*

Dr Tennant in his writings makes a strong case that the Body can be best understood (and treated): As An Electrical System. He shares interest with other researchers and practitioners in the pH of the body: which is shorthand for potential for hydrogen ion concentration. It is a way of talking about the amount of acid and base in our bodies. And Dr Tennant points out it is also a way of talking about the amount of voltage in our body. There is a growing consensus that healing of chronic illness takes place only when and if the blood is restored to A Normal, Slightly Alkaline pH, which is about 7.3 on a scale of 0 to 14 where 0 is the most acidic and 14 is the most alkaline. Chronic Disease and Pain Are Almost Always Associated with an Acidic pH which, in Dr Tennant's view, is the same as saying it is almost always associated with a loss of voltage.

Measurement of salivary pH gives a good indication of cellular pH; and of how much voltage is stored in your cellular batteries. Dr Tennant and other experts agree it should never be lower than 6.5. Testing with readily available pH strips is an excellent way to learn exactly the state of your acidic-alkaline balance at any point in time." - Dr Michael Willock, DDS, in "Key to Rejuvenation: Balance pH", Health & Healing in the Triangle, 2010.

Excessive Acidity of Nerves is Responsible for a Host of Serious Ailments

"Excessive Acidity of the Nerves May be Responsible for a Host of Serious Ailments; was pointed out by Dr Robert Gesell, MD, Neurophysiologist, Chairman of the University of Michigan's Department of Physiology since 1923.

The Acid Nerve Condition which may be responsible for pilot failure in high-altitude flying without oxygen can not be counteracted by the Soda Bicarbonate or other alkaline powders which the layman takes for his so-called acid stomach. Excessive alkalinity of the nerves may cause just as much trouble as excessive acidity. The degree of acidity or alkalinity of nerves that makes the difference between health and serious illness is actually rather small. But the shift from just the proper balance to excessive acidity or alkalinity of the nerves may influence all body processes, including breathing, heart action and digestion." - in "Fed. Am. Societies Experimental Biology", Science, 10 April 1942.

Without Water, Death Occurs Quickly

"Without Water, Death occurs quickly. A human, can go without Water for 3 Days. Many patients who are dehydrated get confused. To ameliorate confusion, they may be prescribed (Medical Trade) Sedatives. When a patient is sedated, they cannot access or ask for a drink. As a person gets too drowsy to drink, fluids may be discontinued and the patient is diagnosed as "imminently dying". Many are dying because they are being neglected, not because they are terminally ill. Something as simple as a glass of Water may save their life. Our most vulnerable members of society are being denied access to water and are literally dying of thirst. "A Review of the Literature on Dehydration in the institutionalized elderly" (e-SPEN, the European e-Journal of Clinical Nutrition and Metabolism 2010), has shown that 31% of patients in long-time care, were dehydrated.

> ***"A total of 200 participants were recruited at admission to hospital, 37% of whom were dehydrated. Of those dehydrated, 62% were still dehydrated when reviewed at 48 h after admission. Overall, 14 (7%) participants died in hospital, 11 (79%) of whom were dehydrated at admission (P = 0.001). The 30-day mortality was greater in those dehydrated at admission than in those who were euhydrated [11 (16%) versus 5 (4%) (P = 0.01)]."*** *- in "Hydration and outcome in older patients admitted to hospital", Age Ageing, August 2015.*

Patients who are dehydrated are 6 times more likely to die in hospital that those who are not dehydrated.” - in “Dying of Thirst”, UK Column, 27 February 2024.

The Clinical Practice of Emunctology

“The Cure of Disease, the Relief of Pain, the Restoration of Health”

These Embody the Object of Emunctology Clinical Practice. It is, thus, of the Utmost Importance, to understand the following, in regards to the Treatment of All Organic, so-called “Diseases”. The Emunctologist should know that the person in a State of Emergency, from Ill Health - in the majority of these cases - there is a State of Acidity in the Bloodstream of such individuals. Thus, the first thing, is to give to the person 1 (one) teaspoonful of Bicarbonate of Soda, in a 250ml glass of Still Water. Normally, these individuals, are also Dehydrated, lacking enough Water in their system, and with Low Levels of Salt. Thus, ½ (half) teaspoon of Sea Salt, should be given to these individuals, along with a bottle of 2 litres of Still Water, for the individual to drink during the next 24 hours.

Emunctology Method of Treatment

The Following Are the 9 Therapeutic Agencies, Which Constitute and Are The Most Useful Scientific Healing Methods, that Encompass Well Established Physiological Principles of Treatment, that are Required by the Body to Recover its Homeostasis (~), and Health:

1 - The Cleansing of the Liver.
2 - The Cleansing of the Colon.
3 - The Removal of All Foci of Infection.
4 - Proper Food Choices.
5 - The Adequate Vitamin and Mineral Supplementation to the Diet.
6 - The Need of Osteopathic Manipulations.
7 - The Need of Chiropractic Adjustments.
8 – The Understanding; that there is a Mind, even a Soul, behind the face of each Individual.
9 - To Apply Correctly All the Knowledge Received at the School of Health in Emunctology.

(~) The State of Steady Internal Physical, and Chemical Balance Maintained by All Living Systems.

The Importance of Homeostasis

The Importance of Homeostasis cannot be overemphasized; it was recognized early by Claude Bernard (1813–1873), Founder of Experimental Physiology.

> ***"The internal environment is constant in warm blooded organisms, and the physiological mechanism resists any external factor which alters the internal state."***

"The constant conditions which are maintained in the body might be termed Equilibria. That word, however, has come to have fairly exact meaning as applied to relatively simple physico-chemical states, in closed systems, where Known Forces are Balanced. The Coordinated Physiological Processes which maintain most of the steady states in the organism, are so complex, and so peculiar to living beings, involving, the: Brain, Nerves, Heart, Lungs, Kidneys, Spleen. All Working Cooperatively. I Have Suggested A Special Designation For These States: Homeostasis. The word does not imply something set and immobile, a stagnation, It Means A Condition: A Condition which may vary, but which Is Relatively Constant. It seems not impossible that the means employed by the more highly evolved animals for Preserving Uniform and Stable their Internal Economy (i.e. for preserving Homeostasis), may present some general principles for the establishment, Regulation and Control of Steady States, that would be suggestive for other kinds of organization (even social and industrial), which suffer from distressing perturbations.

A Comparative Study would Show that Every Complex Organization Must Have more or less Effective Self-Righting Adjustments in order to Prevent a Check on its Functions, or a rapid disintegration of its parts when it is subjected to stress. If there is need for Salt in the Body, as there may be, reports are on record that such animals travel long distances to "salt licks" to satisfy their "hunger." The type of homeostatic arrangement which keeps constant the salt level in the blood appears to be the same as that of water. "Salt hunger" may be analogous to thirst as a means of meeting the gross requirements of the organism. In practically all respects The Control of Water, and The Control of Salt Are Alike, and it is probable that They Usually Run Parallel.

The Homeostasis of Body Temperature, like that of the Oxygen Supply to the tissues, is achieved by modifying the speed of a continuous process.

There is little doubt that the mechanisms of Homeostasis belong to the general category of Protective Functions. Homeostasis; If Not Guarded Against, Profound Disorders May Result." - in "The Wisdom of the Body", 1932.

Glands, Blood And Secretions

“The physician at the Court of Louis the Fifteenth, Théophile de Bordeu.

Of him, Garrison writes: “It was his ambition to confirm and uphold the humoral pathology of Hippocrates, and he regarded the three Hippocratic stages of disease, irritation, coction, and crisis as dependent upon the glandular and other secretions. Bordeu’s reputation today is concentered in a single idea; the doctrine that not only each gland, but each organ of the body, is the workshop of a specific substance or secretion which passes into the blood and that upon these secretions the physiological integration of the body as a whole depends.

To its effect upon the blood and thence, through the corresponding effect of such blood, upon the entire organism.” The body is possessed of a variety of structures that in function amount to chemical laboratories. These are the glands such as those which secrete saliva in the mouth or tears to moisten the eyes.

The Glands remove from the blood that courses through them particular substances that go to make up their Secretions. The tears are merely so much salt water drained as such from the blood. Numerous glands, however, not only abstract from the circulation raw materials but further elaborate them into chemical substances with unique properties.

Ductless Glands

Most glands have ducts through which their secretions are discharged. Another type, however, formerly often referred to as the “Ductless Glands,” dispose of their products directly into the blood stream. These products for the most part constitute the hormones. Insulin, which is produced in the digestive gland, the pancreas. The organs now known to produce hormones are the pituitary, the thyroid, the parathyroids, the adrenals, the pancreas, the stomach and intestines, the ovaries and the testes. Other organs probably or possibly having endocrine functions are the pineal, the thymus, the liver, the heart and the spleen.

The Hormones

The Hormones may be formally defined as substances produced in one part of the body and distributed by the blood or the lymph to other parts, the structures or functions of which are thereby modified. The hormones include a special group of chemical substances that play an important role in the regulation of numerous bodily functions.

The term “hormone” is derived from the Greek “hormao,” which means “I excite.” The term, however, is in a measure a misnomer in that the internal secretions may either increase or decrease bodily activities.

The fundamental functions such as digestion or growth even in the higher animals are primarily under hormone control. Reproduction with its numerous bodily and psychic adaptations is likewise strikingly dependent upon hormone factors. These facts suggest that chemical control and, in the higher animals, specific hormone control. Hormones for the most part are fairly simple chemical substances. Several have been identified as crystalline bodies.

They are astonishingly potent. Adrenine, for example, introduced directly into the blood stream exerts a definitely appreciable effect when its concentration has reached only one part in four hundred millions.

Professor Abel, Johns Hopkins University, has isolated a substance from the pituitary gland so potent that 5,000 miles of such carts would be required to reduce 1 ounce to the undetectable point. Thyroxine, the hormone of the thyroid gland, is so potent that one-thirtieth of a grain is sufficient; temporarily to increase the oxidation processes of the adult human body by 1%.

Thus, one grain would roughly cause any of us to live a third faster than we should in complete absence of the thyroid gland.

It has been estimated by what we do and are. In the present they cooperate in determining the forms of our bodies and the working of our minds.” - in “The Tides of Life: The Endocrine Glands in Bodily Adjustment”, 1933.

The Interplay Between the Psyche and the Endocrine System

“The corresponding practical goal is to be able to correctly determine the differential indications for psychoanalysis versus hormonal therapy.

It remains surprising, for instance, to encounter a case of impotence in a young man; where psychoanalysis was given the phobic mechanism underlying the condition; but where a co-existing hearing impairment so severely hindered the analysis that the advice to first attempt a course of hormonal treatment was followed, yielding rapid and lasting success.

In other instances, a correctly indicated hormonal treatment improves the prospects for the subsequent analysis.

The analyst, should acquire fundamental knowledge of this field, where the economics of drive life and affective states play out.

Freud himself advocated attempting to combine psychoanalysis and hormonal treatment in appropriate cases; he personally fulfilled his own earlier admonition that psychoanalysis must secure its findings before endocrinology discovered a biological, causal therapy.

These cases involve, firstly, those where an abnormal drive constitution can be demonstrated; secondly, those involving chronic or periodic "reservoir" discharges; and thirdly, those characterized by a persistent reduction in the excitability of entire functional systems. While these organically determined abnormalities are certainly subject to psychological influence, psychoanalysis is nonetheless greatly complicated by them, as excessive resistances or an excess of acting-out repeatedly disrupt the analytic process, or conversely a state of torpor causes it to flag. In the final chapter, Hoskins rightly states that **"Endocrine Abnormalities in the years preceding puberty leave a lifelong mark on the individual**"; in such cases, would not timely endocrine therapy; already frequently practiced today; facilitate psychoanalysis? The same applies to later stages of life, and not merely to periods of developmental crisis, for **"in all manifestations of life; whether of a sensory-physical, sexual, or psychological nature; we are highly dependent on the functions of the Endocrine Glands."**

The book is highly recommended; it informs the reader, while offering food for thought to the knowledgeable one." - P. Federn, Vienna, in "R. G. Hoskins, Director of Endocrine Research in the Medical School of Harvard Universit: "Die Hormone" [The Hormones]. Translated and adapted into German by Wolf v. Drigalski. Felix Meiner Verlag, Leipzig, 1934. (The American original, "The Tides of Life: The Endocrine Glands in Bodily Adjustment", 1933)", Internationale Zeitschrift für Psychoanalyse, XXII, Band, Heft 3, 1936.

The Endocannabinoid Network

"The Endocannabinoid Network is activated by stressful circumstances, such as Pain, and Anxiety, to Induce Sedation.
It also stimulates Appetite in an attempt to Relieve the sensation of Hunger.

In addition, the Endocannabinoid Network is involved in:

1. **Neuroprotection.**
2. **Nociception Modulation.**
3. **Motor activity regulation.**
4. **Memory Processing.**

The Endocannabinoid Network is a Physiologic System of paramount Metabolic and Neurophysiologic Importance. And its hyperactivity appears to play an important role in the accumulation of visceral fat and the development of obesity and the Cardiometabolic Syndrome. From a structural standpoint, Endocannabinoids derive from phospholipidic precursors on the cellular membrane and are synthesized from arachidonic acid, an essential fatty acid belonging to the Ω-6 family. The most extensively studied cannabinoids currently are arachidonyl-ethanol-amide (anandamide) and arachidonyl glycerol. These 2 molecules bind to specific receptors located in areas of the hypothalamus functionally related to regulation of behavior. On completion of their physiologic actions, they are almost immediately degraded by a tightly regulated enzymatic network. **The Endocannabinoid Network should be considered not only as a central neuromodulator, but also as a regulator of multiple metabolic steps influencing the Neuroendocrine and Metabolic Systems. The mechanisms of actions of Endocannabinoids that reach far beyond Central Nervous System effects over appetite and affect Global Energy Homeostasis. Knowledge about these features and actions yet to be uncovered about physiologic actions of Endocannabinoids will likely lead to the synthesis of compounds with highly selective characteristics that will improve the management of obesity, Cardiometabolic Syndrome, and other conditions affecting the Central Nervous System and Endocrine Systems."** - in **"The Endocannabinoid Network: Insight Into the Regulation of the Neuroendocrine and Metabolic Systems",** The Journal of Cardiometabolic Syndrome, Winter 2007.

Cannabis Sativa And The Body's Endocannabinoid Network

"Cannabis interacts with the Endocannabinoid Network a Physiologic System, is the Body's Natural system to Maintain Homeostasis. For thousands of years, humans have cultivated Cannabis for its fiber, seeds, and medicinal properties. Ancient Hindu texts claim it was brought by Shiva for the pleasure of humanity. The plant contains over 400 Chemicals, including Cannabinoids, which are most abundant in the resin glands of budding female plants.

In the 1960s, THC (Delta-9-TetraHydroCannabinol, is the main psychoactive compound in Cannabis) was isolated, the psychoactive cannabinoid that makes users feel high. The discovery launched a new chapter in Neuroscience.

The Plant Cannabis Sativa opened a window into the functioning of our body, completely unexpected window. Because what was discovered was that THC binds to receptors in the brain and outside the brain, and when it does so, when it binds to these receptors, the cells now behave differently.

Cannabinoid Receptors (named after Cannabis):

Are Found on Nearly Every Organ In The Body.

They bind with our own cannabis-like molecules, called Endocannabinoids, which Regulate Runctions like:

1. Sleep.
2. Cognition.
3. Memory.
4. Mood.

Unlike other brain chemicals, they travel backwards, across the synapse, where they control the release of most neurotransmitters. One of the most amazing things that happened was the discovery of the Endocannabinoid System: Every Mammal Has One, and this is a system of chemicals and receptors throughout the Brain and Body. And really the primary goal of the Endocannabinoid System is Homeostasis, keeping things in balance.

A key role of the Endocannabinoid system is to manage stress. In fact, the first Endocannabinoid found in our body was given a Sanskrit name, anandamide, meaning "bliss." In response to stress, our body mobilizes an Endocannabinoid signal. And so, if something aversive happens to us and we suddenly see a threat in front of us, our body kind of goes into a high alert mode and we shoot up.

Once we've been removed from that threat, though, our body needs to turn that stress response back off. And what we have learned is that this burst of Endocannabinoids that occurs in response to stress is really critical for that recovery phase." - in "The Cannabis Question", NOVA Learning, PBS, 2021.

> ***"Endocannabinoid System (ECS), is critical for almost every aspect of our moment-to-moment functioning, it regulates and controls many of our most critical bodily functions: learning and memory, emotional processing, sleep, temperature control, pain control, inflammatory, immune responses, eating. The ECS comprises a vast network of chemical signals and cellular receptors that are densely packed throughout our brains and bodies. The "cannabinoid" receptors in the brain (CB1 receptors) outnumber many of the other receptor types on the brain. They act like traffic cops to control the levels and activity of most of the other neurotransmitters. To stimulate these receptors, the body produce molecules called Endocannabinoids, which have a structural similarity to molecules in the Cannabis Plant. A Second type of cannabinoid receptor (CB2 receptor), exists mostly in our immune tissues and is critical to helping control our immune functioning, and it plays a role in: modulating intestinal inflammation, contraction, and pain in inflammatory bowel conditions."*** *- in "The Endocannabinoid System: Essential and mysterious", Harvard Health, 11 August 2021.*

> ***"The Endocannabinoid System (ECS) is a widespread Neuromodulatory Network Involved both in the Developing Central Nervous System, as well as Playing a Major role in tuning many cognitive and physiological processes. The ECS is composed of endogenous cannabinoids, cannabinoid receptors and the enzymes responsible for the synthesis and degradation of Endocannabinoids. Narrowly defined, endogenous cannabinoids (Endocannabinoids, eCBs) are signaling lipids that activate cannabinoid receptors. ECS is present from the earliest stage of pregnancy, in the preimplantation embryo and uterus, placenta and in the developing fetal brain. [Cannabinoid Receptor Type 1 (CB1Rs), are proteins found in the brain and Central Nervous System that detect cannabinoids, including those from Cannabis and the body's own endocannabinoids. They are a key part of the Endocannabinoid system, and Play a Crucial Role in Regulating Neurotransmitters, and Functions like: Mood, Appetite, Pain, and Memory]. In human fetal brains, CB1Rs can be detected at week 14 of gestation, with preferential expression in the cerebral cortex, hippocampus, caudate nucleus, putamen and cerebellar cortex, mirroring their adult distribution."*** *- in "Review of the Endocannabinoid System", Biological Psychiatry: Cognitive Neuroscience and Neuroimaging, June 2021.*

The Equilibrium Of The Body

For the Body System, Equilibrium is Fundamental, especially, in those elements as are necessary to create a normal equilibrium in the body system, for the general equilibrium is necessary for a normal functioning organism.

Does draft cause a cold?

Does unusual change in dress?

Does change in temperature?

Does getting the clothes or the feet damp? , Etc...

All of These, to be sure, Affect the Circulation; by the depletion of the Body Balance, the Body Temperature, or Body Equilibrium.

Then, at such times when a body is Tired, worn, Over-Acid or Over-Alkaline, it is More Susceptible to Cold, even by the very changes produced through the Sudden Unbalancing of Circulation, As From a Warm Room Overheated. Naturally when Overheated there is Less Oxygen, which Weakens the Circulation in the life-giving forces that Are Destructive to Any germ, or contagion, or such. As is known, All Vital Forces are activities of the Glandular System; and these are stimulated by specific glandular activity attributed to the functioning of certain portions of the system.

> *"Pearl, has pointed out that* ***if all the ordinary causes of premature death were eliminated, this would increase the average duration of life. It is evident, then, that if Longevity is our goal, It Is Not Medical Science we must look to. Only to Search Out, and Study the Secrets of Nature, by way of experiment can we hope to attain to a comprehension of "the wisdom of the body and of the understanding of the heart", and thereby; to the mastery of disease and pain, which will enable us to relieve the burden of Mankind."*** *- Prof. E.H. Starling, FRS, in "Hormones", Nature, 1 December 1923.*

The Seat of the Mind

"Could we look at the question of a **seat for the mind within the body.**

Can we attach any meaning to the fact that it is localized in the nervous system? The nervous system has had the special office from its earliest appearance onward throughout evolutionary history more and more to weld together the body's component parts into one consolidated mechanism reacting as a unity to the changeful world about it. **More than any other system it has constructed an individual of unified act, and experience.** In that system mind, as we know it, has had its origin.

The cortex of the forebrain is the seat of mind.

From small beginnings it has become steadily a larger and larger feature of the nervous system until in adult man the whole of the rest of the system is relatively dwarfed by it. **The mental attributes of the nervous system are the coping-stone of the construction of the individual.** But they do not stop at the individual; they proceed beyond the individual; they integrate from individuals to communities. When we review the distribution of mind within the range of animal forms, we meet with two peaks of development - one in insect life, the other in the vertebrate, with its acme finally in man. In the insect the type of mind is not rational but instinctive, whereas in man there is reason as well as instinct.

Yet in both one outcome seems to be the welding of individuals into societies on a scale of organization otherwise unattained.

The greatest social animal is man; the powers that make him so are mental.

The Living Creature Is Fundamentally a Unity.

In trying to make the how of an animal existence intelligible to our imperfect knowledge we have to separate its whole into part-aspects and part-mechanisms, but that separation is artificial. **Can we suppose a unified entity which is part mechanism and part not?** One privilege open to the human intellect is to attempt to comprehend, not leaving out of account any of its properties, **the how of The Living Creature As A Whole. In the biological synthesis of the individual it regards mind.** It includes examination of man himself as acting under a biological trend and process which is combining individuals into a **multi-individual organization.** For this biological trend and process is constructing a social organism whose cohesion depends mainly on a property developed so specifically in man as to be, broadly speaking, his alone - namely a mind actuated by instincts, but instrumented with reason.

“Man, often Nature’s rebel”, as Sir Ray Lankester has luminously said, can, viewing this great supra-individual process, shape even as individual his course conformably with it, feeling that in this instance to rebel would be to sink lower rather than to continue his own evolution upward.” - in “Sherrington, his life and thought”, 1979.

> ***“Mind does not seem to attach to life, however complex, where there is no nervous system, nor even where that system, though present, is quite scantily developed. Mind becomes more recognizable the more developed the nerve system. Hence the difficulty of the twilight emergence of mind from no mind, which is repeated even in the individual life history. The so-to-say mental portion of the system is placed so that its commerce with the body and the external world occurs only through the archaic non-***

> ***mental rest of the system. To pass from a nerve impulse to a psychical event, a sense-impression, percept, or emotion is, as it were, to step from one world to another and incommensurable one."*** *- Prof. Dr Charles Scott Sherrington, MD, in "Some Aspects of Animal Mechanism", Science, 29 September 1922.*

Prof Dr Charles Scott Sherrington, MD, was a Neurophysiologist, his Research E**stablished the Concept of the Spinal Reflex as a system involving connected neurons "the neuron doctrine", and the ways in which signal transmission between neurons can be potentiated or depotentiated**. The Book "The Integrative Action of the Nervous System", 1906, is a synthesis of this work, in recognition was awarded the Nobel Prize in Physiology or Medicine in 1932.

> ***"Meditate often on the Interconnectedness and Mutual Interdependence of all things in the universe. For in a sense, All Things Are Mutually Woven Together, and therefore Have An Affinity for Each Other; for One Thing Follows After Another According to their Tension of Movement, their Sympathetic Stirrings, and The Unity of All Substance."*** *- Marcus Aurelius, Roman Emperor, in "Meditations" 6.38, 121–180 AD.*

> ***There are physical contacts in thy own Body with thy own Soul, thy own Mind.***

Is The Mind Merely a Function of the Brain?
Or is it a Separate But Closely Related Element?

> ***"Mind, meaning by that thoughts, memory, feelings, reasoning, and so on, is difficult to bring into a class of physical things." - Sir Charles Sherrington***

Can the Brain Explain the Man?
Can the brain achieve by neuronal action all that the mind accomplishes?

> ***"To consciousness the brain is messenger. The brain is the interpreter of consciousness." - Hippocrates of Kos***

"Throughout my own scientific career I, like other scientists, have struggled to prove that the brain accounts for the mind. But perhaps the time has come when we may profitably consider the evidence as it stands, and ask the question:

Can the mind be explained by what is now known about the brain?

> ***"Starting with the physical hypothesis (accepted by all scientists as a belief in order to gain knowledge): that the physical attributes of man and energy alone are what they can deal with. But there are discoveries made that does not fit into the scientific picture. It is the testimony of living, conscious patients. This is an objective item in your scientific evidence. How can it be fitted into the assumed hypothesis of an entirely physical nature of man? I belief that mind has a being distinct from body, though intimately related to and dependent on body. Mind is a very distinctive reality. The consciousness of man, the mind, is something not to be reduced to brain-mechanism." - Charles W. Hendel, Professor of Moral Philosophy and Metaphysics, Emeritus, Yale University; Director, Montreal Neurological Institute; William Cone Professor of Neurosurgery, McGill University.***

I reconsider the present-day neurophysiological evidence on the basis of 2 hypotheses:

1. **That Man's Being Consists of 1 Fundamental Element.**
2. **That Man's Being Consists of 2 Fundamental Elements.**

I conclude that there is no good evidence, that the Brain alone can carry out the work that the Mind does; and that it is easier to rationalize man's being on the basis of 2 elements than on the basis of 1. The mind must be viewed as a basic element in itself. One might call it a medium, an essence, a soma. That is to say, it has a continuing existence. The Brain is the vastly complicated master organ with-in the body that makes thought and consciousness possible. An individual brain-mechanism is a functional unit that plays a somewhat specialized role in the total integrative action of the brain. Each Nerve Cell, or Neurone, is capable of developing its own Electrical Charge. Each has one branch called the Axone, among its many branches. The Axone carries a current of neuronal impulses outward, away from the cell, to other cells. The arriving impulses stimulate each target cell to flash the message onward, or they check activity in the target cell producing inhibition of cell activity. The cell bodies are collected together, forming islands, or blankets of gray matter. The branching connections form the white matter. This whole system vibrates, one might say, with an energy that is normally held in disciplined control, like that of a vast symphony orchestra, while millions of messages flash back and forth, to as many functional targets. However, when some abnormality presents itself within the skull, and becomes a chronic abnormality that irritates the gray matter, it forms a focus of irritation and may cause a recurring disorderly

explosion of energy involving many cells at once, like lightning from a miniature thunder cloud. Each time this happens, an epileptic fit comes.

The attack varies in outward character according to the function of the gray matter in which the discharge takes place. If it occurs in the cells of the gray matter that forms a part of one of the sensory circuits, a sensation is felt; if it occurs in cells of the motor system, movement follows. Physicians, whose task it is to deal with the whole man, take a unique view of him.

They have learned, to: "Treat the Mind as well as the Body."

They are well aware that Body (Brain), and Mind make up the child.

They develop together and yet they seem to remain apart as the years pass.

These in a sort of ontogenetic symbiosis, go through life together." - Dr Wilder Penfield, Brain Surgeon, in "The Mystery of the Mind", 1975.

> ***"The days of our years are 70; and if by reason of strength they be 80, yet is their strength labour and sorrow; for it is soon cut off, and we fly away. Who knoweth the power of thine anger? even according to thy fear, so is thy wrath. So teach us to number our days, that we may apply our hearts unto wisdom."*** *- Psalm 90:10-12*

The Mental Attributes of the Nervous System

"The mental attributes of the nervous system would be, then, the coping-stone of the construction of the individual. Great differences of difficulty therefore confront our understanding of various aspects of animal life.

The Living Creature Is Fundamentally A Unity

In trying to make the how of animal existence intelligible to our imperfect knowledge we have for purposes of study to separate its whole into part aspects or part mechanisms but that separation is artificial. **It is as a whole or single entity that the animal or for that matter the plant is finally and essentially to be envisaged. We cannot really understand one part without the other. Can we suppose a unified entity which is part mechanism and part not?** One privilege open to the human intellect is to attempt to comprehend, not leaving out of account any of its properties, the "how" of **The Living Creature As A Whole.** The problem is ambitious, but its importance and its reward are all the greater if we seize and attempt the full width of its scope." - Prof. Dr Charles Scott Sherrington, MD, in "Some Aspects of Animal Mechanism", Science, 29 September 1922.

The Nervous System Is Regarded As A Whole Inclusive of The Mind

"The Treatment of Nervous and Mental Diseases, with advances in the knowledge of Neurology and Psychiatry. The Nervous System Is Regarded as a Whole; and as Inclusive of the Mind, and it is maintained that disturbances of any and all of its functions, mental as well as physical, are proper subjects for therapeutics. The word "insanity" should be eliminated from a 20th century work on medicine. It is a relic of that time when all Brain Disorders, with predominant Mental Symptoms, were considered as one disease. It has no place in the present order of things; certainly not in medicine, and probably better not in law.

Psychical And Physical

The present work lays emphasis upon the Psychical side of life; as being worth quite as much consideration as the Physical. It sets forth doctrines of Nervous, and Mental Hygiene, reconstructive factors in social organization as applied to human ills, and endeavours to present a broad front to the pessimistic nihilism in therapeutics that has been too long current in these fields, because the [Medical Trade] doctors eyes have been too closely focussed on the individual examples and result of human accidents." - in "The Modern Treatment of Nervous and Menial Diseases", 1913.

We Discern The Power of Truth And Love To Heal The Sick

"The true knowledge of God; as imparting the only power to heal the sick and the sinner, we shall demonstrate in our lives the power of Truth and Love.

Divine Science, brought to the understanding through Christ, the Spirit-revelator, is man healed and saved. No opinions of mortals nor human hypotheses enter this line of thought or action. Drugs, inert matter, never are needed to aid spiritual power. The Principle of all cure is God, unerring and immortal Mind. The tendency of Mental Healing is to uplift mankind. Thought imbued with purity, Truth, and Love, instructed in the Science of metaphysical healing, is the most potent and desirable remedial agent on the earth.

All Science is Christian Science; the Science of the Mind that is God, and of the universe as His idea, and their relation to each other. Its only power to heal is its power to do good." - Mary Baker Eddy in "Miscellaneous Writings", 1896.

The Inadequacy of Separatist Principles

"But if there is a radically distinct intellectual power of force in man, is such a distinction of kind so isolated a fact as many suppose?

May there not exist between the forces which living beings exhibit other differences of kind?

Each living being consists of an aggregation of parts and functional activities which are evidently knit together into a unity.

Each is somehow the seat or theatre of some unifying power or condition which synthesises their varied activities, and is a principle of individuation.

To me it seems that we must admit the existence of such a living principle.

We may analyse the activities of any animal or plant, and by consideration of them separately find resemblances between them and mere physical forces.

But the synthesis of such forces as we find in a living creature is certainly nowhere to be met with in the inorganic world.

This seems certainly to have been the opinion of Buffon, and it is to this opinion that I referred in speaking of the fourth cause to which he attributed the changes in organic forms.

And to me it seems that we must admit the existence of such a living principle.

To deny this would be to deny the plainest evidence of our senses.

To assert that each living body is made up of minute independent organisms, each with its own "principle of individuation", and without subordination or co-ordination, is but to multiply difficulties, while such a doctrine conflicts with the evidence of our own perceptions, which lead each of us to regard himself as one whole — a true rarity in multiplicity.

The existence in each creature of a peculiar, co-ordinating, polar force, seems to be specially pointed to by the phenomena of serial and bilateral symmetry, by the symmetrical character of certain diseases, by the phenomena of monstrous growths and by the symmetrical beauty of such organisms as the Radiolarian Rhizopods. It also seems to me to be made evident, by the various activities of each animal, which are, as a fact, grouped in one in mutual interaction — an organism having been described by Kant as a creature, the various parts of which are reciprocally ends and means.

The "Vitalism" which is so reasonably objected to, is that which supposes the existence in each living creature of some separate entity inhabiting the body—an extra-organic force within the living creature, and acting by and through it, but numerically distinct from it.

But the view which I venture to put before you as that which is to my judgment a reasonable one, is that of a peculiar form of force which is intra-organic, so that it and the visible living body are one thing, as the impress on stamped wax and the wax itself are one, though we can ideally distinguish, between the two. It is, in fact, a mode of regarding living creatures with, prime reference to their activities rather than to their material composition, and every creature can of course be regarded either statically or dynamically.

It is to regard any given animal or plant, not as a piece of complex matter played upon by physical forces, which are transformed by what they traverse, but rather as a peculiar immanent principle (*) or form of force (whensoever and howsoever arising), which for a time manifests itself by the activities of a certain mass of complex material, with which it is so entirely one that it may be said to constitute and be such animal or plant much rather than the lump of matter which we can see and handle can be said to constitute such animal or plant.

(*) - The word "principle" has been used to denote that activity which, together with material substance, constitutes a living creature, because that word calls up a less sensuous, and therefore less misleading, phantasm than, any other. The term soul, has in modem times come to be associated with the idea of a substance numerically distinct from the living body, and capable of surviving the destruction of the latter. But as structure and function ever vary together (as do the convexities and concavities of a curved line), so **"the principle of individuation" or soul of an animal or plant and its material organisation must necessarily arise**, vary, and be destroyed simultaneously, unless some special character, as in the case of man, may lead us to consider it exceptional in nature. Even in man, however, there seems no adequate reason for believing in the existence of any principle of individuation, save **that which exerts its energy in all his functions**, the humblest as well as the most exalted. **Thus the real essence, the substantial constituent of every living thing is something which escapes our senses, though its existence and nature reveal themselves to the intellect.**

This power or polar force, which is imminent in each, living body, or rather which is that body living, is of course unimaginable by us, since we cannot by imagination transcend experience, and since we have no experience of **this force, save as a body living and acting in definite ways.**

Though no knowledge is possible for us which is not genetically traceable to sensation, yet the ground of all our developed knowledge is not sensational, but intellectual, and its final justification depends, and must depend, not on "Feelings," but on "Thoughts." "Thought", therefore, is our absolute criterion.

It is by self-conscious thought only that we know we have any feelings at all.

Without thought, indeed, we might feel, but we could not know that we felt or know ourselves as feeling. If, then, we have rational grounds for the acceptance of such a purely intellectual conception as that of an immanent principle as the essence of each living creature, the poverty of our powers of imagination should be no bar to its acceptance. We are continually employing terms and conceptions (such, e.g., as “being”, “substance”, “cause”, etc.), which are intelligible to the intellect (since they can be discussed), though they transcend the powers of the imagination to picture. It seems to me that the spirit which would deny such realities is the same spirit which would deny our real knowledge of an external world at all, and represent any material object as “state of consciousness”, and at the very same time represent “a state of consciousness ” as the accompaniment of a peculiar state of a material object - the body. Those who deny that we have a real power of perceiving objects, refute themselves when they speak of “purely physical changes”, or of anything “physical” of which feelings are but the “accompaniment” or “subjects.” For according to them “matter” is but a term for certain “states of consciousness” while they represent each state of consciousness as a function of matter. According to this, let a represent a state of consciousness, and a “physical state.” This mode of representation may be shortly, but not unjustly, described as a process of intellectual “thimble-rigging”, by which the unwary spectator is apt to be cheated out of his most valuable mental possession — his rational certainty. The same spirit asserts that our psychical powers never themselves enter into the circuit of physical causation, and yet few things would seem more certain to a plain man than that (supposing him to have received a message saying his house is on fire), it is his knowledge of what has been communicated which sets him in motion. **To deny this is to deny the evident teaching of our consciousness.** It is, in fact, a mode of regarding living creatures with prime reference to their activities rather than to their material composition, and every creature can of course be regarded either statically or dynamically. **As Each Living Creature Is A Highly Complex Unity; Both a Unity of Body and also a Unity of Force, or a synthesis of activities, it seems to me that we require a distinct kind of physiology to be devoted to the investigation of such syntheses of activities as exist in each kind of living creature.** I mean to say that just as we have a physiology devoted to the several activities of the several organs, which activities are the functions of those organs, so **we need a physiology specially directed to the physiology of the living body considered as one whole, that is, to the power which is the function, so to speak, of that whole, and of which the whole body, in its totality, is the organ. In A Word: We Need A Physiology of the Individual.”** - Prof. George Mivart, FRS, in “Nature”, 21 August 1879.

Consciousness Cannot Be An Agent In The Mechanism

“We observe mental facts of irresistible certainty interpreted by material hypotheses of questionable value; and not only so, but a higher validity is assigned to the material hypotheses than to the mental facts they are invented to explain.

That we are conscious, and that our actions are determined by sensations, emotions, and ideas, are facts which may or may not be explained by reference to material conditions, but which no material explanation can render more certain.

It is also a fact that many actions take place, as we say, unconsciously and involuntarily; and that some take place now consciously, now unconsciously.

These facts also we endeavour to explain: and when **we find that some of the unconscious and involuntary actions Take Place After The Brain Has Been Removed, this is interpreted on the material hypothesis of the brain being the sole seat of sensation and consciousness; and Is Urged In Favour of the hypothesis that Consciousness Cannot Be An Agent In The Mechanism.**

Consciousness as a subjective fact Cannot Be A Material or Objective Fact.” - George Henry Lewes, in “The physical basis of mind”, 1891.

Organic Regulation As The Essence of Life

“We saw that the internal environment is kept constant as the result of a continuous and extraordinarily delicate regulation of the balance between opposing activities. What general conception can we form of this balancing process?

An obvious possible interpretation is that each of the various organs concerned in the balancing process has such a physical and chemical structure that it reacts to a given small deviation in the internal environment so as to prevent further deviation in this direction. As the combined result of the reactions of all the organs the internal environment as a whole remains constant.

It is evident, for instance, that the respiratory centre reacts to very small differences in the hydrogen ion concentration in the blood, in such a way as to prevent larger differences from occurring.

The temperature-regulating centre reacts to small differences in the blood-temperature. The kidneys react in a similar way to very small differences in the concentrations of water, urea, and numerous other inorganic or organic substances.

The organs, such as the liver, or fat-containing tissues, in which material is stored, appear to behave similarly; and we have now every reason to believe that we should find the same regulating activity in every organ or part of the body if our methods of investigation were sufficiently delicate, and we knew the small differences to be detected. In every direction the progress of physiology and pathology is revealing the astounding delicacy and complication of the regulating processes. Up to a certain point we can rest satisfied in the idea that the regulation of the internal medium depends upon the specific structures and corresponding reactions of the organs which bring about the regulation.

But the more we learn about the delicacy and complexity of the regulating processes, the more definitely does a difficulty appear.

It is not for nothing that the body regulates its internal environment so exactly.

The investigations which reveal the exactitude of the regulation reveal equally its fundamental importance to the nutrition and normal working of every part of the body. The organs and tissues which regulate the internal environment are themselves centres of nutritional activity, dependent from moment to moment on their environment.

They are constantly taking up and giving off material of many sorts, and their "structure" is nothing but the appearance taken by this flow of material through them. **The fact has already been referred to that when the supply of Oxygen to the tissues is seriously restricted the result is not merely a slowing down of activity, but actual structural change.**

Similar structural change is known to result from many other slight alterations in the composition of the blood; and so far as the evidence goes, it points to the conclusion that the specific structure of every part of the body depends upon the specific composition of the blood, as well as on the influence of the adjacent tissues or external environment. The regulation by the tissues and organs of the internal environment is thus only their regulation of their own structure and activity. A living organism has, in truth, but little resemblance to an ordinary machine. **We cannot draw any complete line of separation between the regulation of the internal and that of the external environment; for evidently the one is complementary to, and indispensable to, the other.**

Regulation of the external environment is in fact only the outward extension of regulation of the internal environment, and the ultimate dependence on the external environment of the organs which regulate it, is as evident as their more immediate dependence on the internal environment. **Deficiency or Excess: in normal Stimuli, normal Nutrition, normal Temperature, and Respiratory exchange, are as important to the Nervous System as to Other Organs.**

The Environment Determines the Nervous Reactions, and the Nervous Reactions the Environment; but the constancy or regulation which emerges is still unexplained.

The conception of an organism as a mere labile structure which determines, and is at the same time determined by, its environment is unsatisfactory, for the reason that the specific persistence of life is left unaccounted for.

The facts must be examined more closely.

We have seen that it is characteristic of an organism to react towards disturbing influences in such a way as to maintain approximate constancy in its structure, internal environment, and even external environment.

If the disturbance is merely slight, temporary, and of normal occurrence, a simple and normal compensating reaction occurs, and everything seems afterwards to return again to its former state.

But if the disturbance is abnormal, or continued, a significant fact emerges more and more clearly: for new and apparently original compensatory reactions arise, or an ordinary compensatory reaction is greatly strengthened, or supplemented.

The new reaction is accompanied by corresponding structural change." - Dr John Scott Haldane, MD, in "Organism and Environment as Illustrated by the Physiology of Breathing", 1917.

The Guiding Principles

"Guiding Principles are necessary, for medical practice, in the same manner as for life in general. Just as life without guiding principles becomes a vegetative and unimportant existence, so Medical Practice Without A Doctrine Becomes a Blind and Ineffective Craft.

The Principle of the Unity of the Organism

The Organism Is A Whole, and Is The Real Biological Unit.

All Organs, Cells, and Organic Structures; Are Interdependent, and have no real existence save as components of a Corporate Whole.

No Organ, Tissue and Organic Structure Is Independent of the Activity of the Others; But the life of each of these elements is merged into the Life of the Whole. The Unit of Human Life Cannot Be "The Organ, Tissue and Structure": **But the Whole Organism.**

> ***"Ralph Emerson conceived that in some way principles operative in the physical world were correspondentially operative in the mental realm. "Every law in Nature, as gravity, centripetence, repulsion, polarity, undulation, has a counterpart in the intellect." He held that upon this all-resolving Unity: "the emphasis of heaven and earth is laid." "Mind carries the law; history is the slow and atomic unfolding. All things admit of this extended sense, and the universe at last is only symptomatic. Nature is an enormous system, but in mass and in particle curiously available to the humblest need of the little creature that walks on the earth."*** *- in "The Flaming Sword", 6 June 1905.*

The Living Creature Is A Unity: Both Unity of Body And Unity of Force

> ***"As the Living Creature is a Highly Complex Unity, Both a Unity of Body, and also a Unity of Force; a synthesis of activity, we need a physiology specially directed to the physiology of the living body considered as One Whole."*** *- Prof. George Mivart, FRS, in an address to the British Medical Association, 1879.*

J. S. Haldane developed the organismal conception with great accuracy and industry. Influenced by the philosophy of Hegel, he taught that biology must deal with: **The Whole Organisms and not with organs or cells.**

The Biologist Has To Deal With Life, and **He Cannot Understand Life Without the Fundamental Conception that:**

> ***"Each Detail of Organic Structure, Composition and Activity Is A Manifestation or Expression of the Life of the Organism, regarded as a separate and persistent whole."*** *- Dr J. S. Haldane, MD, in "Organism and Environment", 1917.*

The Living Creature As A Whole : A Single Entity

> ***"William Bateson in his Presidential Address to the British "Report of the Proceedings of the British Association for the Advancement of Science", 1914, "Living things are found by a simple experiment to have powers undreamt of, and who knows what may be behind?" Charles Scott Sherrington in "Report of the Proceedings of the British Association for the Advancement of Science", 1922, in his Presidential Address to the same Association in 1922, he maintains that: The Living Creature Is Fundamentally A Unity. "It is as a whole, a single entity, that the animal, or for that matter the plant, has finally and essentially to be envisaged. We cannot really understand its one part without its other. Can we suppose a unified entity which is part mechanism and part not?" While giving no answer to his own question, he says it is one of the privileges of***

> ***the human intellect "to attempt to comprehend, not leaving out of account any of its properties, the how of The Living Creature As A Whole." It appears as though Frederick Soddy in "Science and Life", 1920, is prepared to regard this Unity as the ultimate mystery of life. "For the real part of a man is not his bodily organism, which is continually wasting away and being as continually renewed, nor the physical energy at its command, which is derived entirely from the inanimate world, but is the personality resident in the body and in control of it. There is no other interpretation of the difference between a man alive one moment and dead the next, which, in spite of the great advances in the interpretation of the mechanism of life made by biology, altogether eludes apprehension in terms of the other fundamental conceptions to which our inquiries into ourselves and our environment have led."*** *- in "Contemporary Thought Of Great Britain", 1927.*

The Integration of the Organism, of the Body-Mind

W. E. Ritter, "The Unity of the Organism, or the Organismal Conception of Life", 1919. Works demonstrating even more distinctly the organismal principle are those which discuss the experimental evidence for the Integration of the Organism, of the Body-Mind. Oliver and Schafer, as well as Bayliss and Starling, Show The Role of Chemical Integration Due To The Endocrines. To these conceptions they have given the stamp of scientific accuracy. Gaskell, Langley, and their pupils, in their work on the Vegetative Nervous System, Have Shown Its Integrating Action. Through This System the Organs and Tissues Are Correlated, In Such A Manner that the Body Can Act As A Whole.

Sherrington crowns the Work on Integration by Demonstrating Experimentally that the Apex of the Integrative Scale Is The Cerebral Cortex.

> ***"Many illnesses are a product of our thoughts. Mental Imbalance (ideas, ideals, reasoning); and Emotional Imbalance (negative thoughts, fear, anger) often lead to the root cause of many physical and mental conditions, revealing the connection between mind and body."*** *- Francisco Xavier*

Endocrines in Health and Disease

> ***"There is not the least doubt that the glands producing internal secretions exert an influence upon the exterior of the individual."*** *- Dr Herman E.S. Chayes, DDS, in "Endocrinodontia, or the ductless glands — Their expression in the human mouth", International Journal of Orthodontia, April 1918.*

> ***"For some years it has become increasingly apparent that the control of the body exerted by the endocrines in health and disease is of constant and utmost importance."*** *- in "The Tides of Life: The Endocrine Glands in Bodily Adjustment", The American Journal of the Medical Sciences, September 1933.*

The continuing the Work on Integration, which is recently developed in Sir Humphry Rolleston's Endocrines in Health and Disease and in the clinical research of Sir Walter Langdon-Brown on The Integration of the Endocrine System.

The Endocrine Glandular System

The Glandular System (Endocrine System), or Endocrine Glandular System, this is: All the Glands; is the most complex of all body systems.

> ***"Clairvoyance has been established since 1934, but Telepathy was not isolated experimentally until later in the 1940s. During the early 1950s visitors began coming to the Duke Laboratory in a fairly steady stream, not merely for an hour or a day, but for a month or more. They were mostly persons who had been working on psi (parapsychology) research and had either a collection of results to discuss and analyse, or a programme of thinking or experiment to evaluate. They came from England, Holland, Sweden, South Africa, South America and elsewhere. Parapsychology would, ideally, belong to the Psychology Department; but American psychology is not ready for that. However, parapsychology is getting along well in a few colleges."*** *- Dr J. B. Rhine, in "Bulletin of the Parapsychology Laboratory", Duke University, 1934-1963.*

> *"The ceaseless struggle between the life and death processes of mankind.*
> *In the prevention and curing of disease, in lengthening the life-span.*
> ***Forced to deal with the subtle interplay of 2 entirely different life-threads: the vital energy of the body, which is temporal, and the psychic energy of the personality, which is eternal. The Human Body Is Designed precisely to Join these 2 threads at Conception, and Separate them at Death. The life-thread is focused in the Endocrine Glandular System Which Controls organic growth and structure, regulates body-chemistry and, in the aggregate, operates physiology. The psychic or consciousness thread of personality [the spiritual side of man] is anchored [attached to the Glands, and it controls the physical body by] the Nervous System, the brain and spinal column, the major nerve centres of the body.*** *The 2 life-systems are completely integrated, and both are subject to the stage of evolution. Medical research, although divided into many special fields, is moving so far and so fast that a major break-through, comparable to that*

> *of atomic release, seems to be approaching. Already neurology and endocrinology are beginning to merge with psycho-analysis, psychiatry and psycho-therapy. While they are focused, as yet, on the diseased not on the healthy human organism, they have positive as well as negative implications and potentials." - in "On the Frontiers of the Mind", The Beacon, January 1964.*

The Integration of the Endocrine System

These last works set forth the Integration of the Body As A Whole by a System Composed of the Psycho-Associational Cortex, Vegetative Nervous System, and Endocrines. All of these being Intimately Connected with each other Under the Domination of the Brain. It is a return to the old conceptions of Alkmaion, **the Body-Mind considered as an Equilibrium of Forces Under the Domination of the Brain, as a "monarchy", the very word used for integration 2,500 years ago.**

> ***"I believe, A Connection Between Mind and Body which leaves no ground for the doctrine of psycho-physical parallelism to stand on."*** *- Prof. William E. Ritter, Biologist, in "An Organismal Theory of Consciousness", 1919.*

Production of Endocrine Dysfunction

"Each year brings forth an increasing amount of literature upon the Physiology of the Endocrines in Health and Disease. Attempts to **tie Endocrine Dysfunction with many recognized and some unrecognizable diseases. Each organ of specialized function, each type of tissue and without doubt each cell contributes its share of endocrine secretion which work together for the normal function of a healthy individual. True research is the careful elimination of untruths, and the amalgamation of truths.** Valuable accomplishments are thus made by the concerted efforts of many over a long period of years, yet within a short few years **extracts of the various endocrine glands and portions thereof have, according to literature, wrought miraculous cures upon many diseases and symptoms of disease, from Dysmenorrhea (painful menstrual cramps) to that most dreaded of all diseases, Cancer, whose kaleidoscopic clinical manifestations place it in the category of being a sign and symptom of many body dysfunctions rather than a separate disease.** There will never be a panacea for the control of all abnormal cell growths. Of the endocrine glands the thyroid because of its frequent diseased state and its surgical accessibility has received much attention.

The Toxic Adenoma (a common, non-cancerous [benign] tumour that grows in glandular epithelial tissue, such as the colon, pituitary, or adrenal glands) produces death chiefly by cardiac damage and surgical interference. The cardiac damage is accompanied by a generalized muscle atony, often exophthalmos, increased basal metabolism, emaciation, mental irritability, etc., the pathologic physiology of which has not been satisfactorily worked out.

Within the last few years the benign tumors of the anterior lobe of the pituitary have been extensively investigated, and remarkable palliation and even cures of the associated deformities have been accomplished by divided doses of x-radiation.

While a rapid death from a benign pituitary tumor is rare the deformities produced and in some cases the speeding up the life process places it in the category of having at least a lethal intent. Benign tumors of the parathyroid glands are responsible for a decalcification process which causes certain clinical manifestations such as osteitis fibrosa cystica and the formation of renal calculi.

There are 2 types of parathyroid tumors recognized, the benign hypertrophy of the so-called Wasserhelle cells and the true adenoma. At the present time they probably cannot be differentiated clinically. These tumors should be radiosensitive and since their locations are accessible to radiation there is a definite possibility that certain cases of nephrolithiasis and the associated bone lesions may be markedly benefited by the x-ray. The benign adenoma of the adrenal cortex which causes precocious puberty in children and virilismus in adults deserves the tribute of recognition.

Infection, Toxaemia and Necrosis

Most untreated large tumors will eventually develop areas of malnutrition due to insufficient blood supply. If the inhibition of cellular nourishment is slow, hyalinization will take place, if more rapid necrotic areas appear which act as a culture media for bacteria, Infection, and Toxemia Result.

Large subcutaneous tumors tend to thin the skin by pressure and to cut down the blood supply so that the trauma of the clothes or bed causes an erosion that refuses to heal. In these cases erysipelas frequently is the direct cause of death.

All pedunculated tumors may become twisted on their pedicle resulting in the cutting off of blood supply. Tumors attached to the gut may cause a volvulus.

Death from toxemia in either case may be the end result.” - Dr Charles DeForest Lucas, MD, in “Benign Tumors That Destroy the Patient”, The Southern Surgeon, August 1937.

The Holistic Conception of Disease

According to this principle disease is of the whole organism, of the Whole Body-Mind. It may have local manifestations in cells and organs, but it is never strictly local. Even when local manifestations predominate they do not constitute a local disease but are manifestations of a preceding general disturbance of the Body-Mind. Sir William Gull said in a lecture to students that to give an idea of Bright's disease he should have shown them not the kidneys and heart of the patient in a bottle but the whole patient. **A more precise demonstration of the holistic nature of disease, however, was offered by the first medical biochemists, who showed that before the appearance of a lesion in an organ the whole chemistry of the body underwent change; a modification of metabolism.** The greatest pioneer on this subject was Albert Robin. Even in the early 1970's, in the midst of the intensely localistic conceptions of the Paris school, he demonstrated the existence of chemical modifications in the body, disturbances in the échanges, as he said, prior to and conditioning local lesions. As he was a skilled biochemist, a pupil of Guy Lussac, as well as a clinician, he could pursue technical investigations on that line, and in many diseases succeeded in demonstrating a general metabolic phase. Demonstration of the holistic nature of disease was made on different lines by those who discovered that preceding the local lesion, and even independent of the local lesion, disturbances of the vegetative nervous system exist. Ricker, the anatomopathologist of Marburg, made important research on the subject, which he summarized in his work, Pathologie als Natur-Wissenschaft. Relationspathologie für Pathologen, Physiologen, Mediziner und Biologen. Sir James Mackenzie by his clinical work did much to promote acceptance of the **holistic nature of disease on the same lines of vegetative nervous dysfunction. The Holistic Nature of Disease, Has Been Shown also by the finding of psychical disturbances, disturbances of the psycho-associational cortex, preceding and dominating local organic affections.** To Charcot principally is due the conception of "psychogenesis", of local organic manifestations, a theory developed by Freud, and by many brilliant physicians who have delved into the mental factor in disease.

The Psycho-Neuro-Endocrine Equilibrium

Thus the contemporary conception, which is not pure speculation but has been demonstrated by precise experimental and clinical work, is that preceding all local manifestations there are **disturbances of Psycho-Neuro-Endocrine Equilibrium,**

which ultimately result in modification of the body chemistry, a disturbance of the humours if we wish to preserve the Hippocratic terminology. This could easily be deduced from what we know of biology.

The Psycho-Neuro-Endocrine System

Through the Psycho-Neuro-Endocrine System the organism adapts itself to its environment. Disease is a struggle of adaptation to a changed environment, and thus the first manifestation must be Psycho-Neuro-Endocrine, that is:

General Constitutional, Metabolic, or "Humoral."

The Dynamic Conception of Disease

Disease represents the struggle of the organism against external evils, the attempts at adaptation on the part of the organism to changes in external conditions. By virtue of the inherent characteristics of life the organism tends to remove all factors that threaten life, it tends to cure itself. This conception therefore depends on the general vitalistic principle according to which every living being is animated by a purposive striving to live, to develop and to immortalize itself by procreation, and for the attainment of its ends is "as if" directed by an inner force; the physis of Hippocrates, the Vital Force of the Montpellier physicians, through which it overcomes all obstacles to its development. **Anatomo-clinical workers such as Sir Andrew Corrigan showed the compensatory work of organs to overcome their deficiency.**

Aschoff in a series of brilliant researches showed the purposive nature of inflammation. **Last but not least, the work of Metchnikoff, and other immunologists demonstrated scientifically this "the healing power of nature" (vis medicatrix nature).** In Germany the constitutional etiology of disease was introduced by Beneke, whose first published work on the subject dates from 1878.

Not until 1892 did interest in the constitution revive, with a paper by **Hueppe, a bacteriologist, who showed the inadequacy of bacterial causalism for the understanding of infectious diseases, and insisted on the importance of the soil, of diathesis, as an aetiological factor.**

The principal work on this subject has been contributed by endocrinolegists, predominantly by Pende, who has detached himself from the exclusive morphological view of the Italian school and considers that constitution or biotype means a special **mode of functioning of the Endocrines, and Vegetative Nervous System, The Great Regulators of Constitution.**

Working on parallel lines, I have developed a conception based on the British **work on Integration. Our constitution, our psychophysical make-up, our biotype, is regulated by the integrative system of the body, the Psycho-Neuro-Endocrine System.**

Psychoneurotic Disability

"Psychoneurotic and Psychosomatic illness.

Note on the Term Psychosomatic Illness; The words "psychoneurotic illness" suggest inter alia, the absence of structural change. **Recent researches. however, have shown that emotional reaction may bring about changes not only in function but also in structure** (Dunbar 1935). A more appropriate term for disorders of this nature — whether they are "cases of functional disease or "cases of organic disease "is psychosomatic illness."

This term is cumbrous but useful. It connotes both an aetiology and a mechanism. As regards aetiology, it indicates that the external agents which provoked the reaction of illness were of a special kind, being neither physical nor chemical nor micro-organic, but psychological as, for example, the loss of a beloved object. **As regards mechanism it indicates that the external agent is encountered by the individual, not directly by the outer or inner surfaces of the body, such as the skin or mucous membranes, but indirectly, via the special senses and the integrating mechanism of the diencephalon, autonomic nervous system, and endocrine glands. This triad is sometimes called the psycho-neuro-endocrine system or the "bodily mechanism of emotion."**

By its means psychological factors may affect an individual profoundly, bringing about changes in chemistry, rhythm, secretion, and even structure in One or more parts of the body.

In other words: Bodily Disturbances May Be The Secondaries of Preceding Disturbances in the Integrating Psycho-Neuro-Endocrine System, which in turn was set into a turmoil when the individual encountered events which to him represented deprivation, frustration, upset strain, or difficulty." - Dr James L. Halliday, MD, in "The Rising Incidence of Psychosomatic Illness", The British Medical Journal, 2 July 1938.

A special constitution and thus a special diathesis means a special mode of functioning of endocrines, vegetative nervous system, and psycho-associational cortex, a special modality of **Psycho-Neuro-Endocrine Equilibrium.**

The biological or constitutional principle of treatment consists in treating a diseased individual by helping, sustaining, his constitution to fight the disease.

It consists thus in adopting those therapeutic agents which clinical experience and physiopathology have proved efficacious in strengthening the constitution in its struggle to recover equilibrium. The object, according to this principle, is not the local disease but the constitution, and action is directed towards the regulators of constitution, the **Psycho-Neuro-Endocrine System.**

To cure disease we must therefore mechanically apply stimuli contrary to those that have provoked the disease. **The Psycho-Neuro-Endocrine System; is the system that fights against external morbid elements.**

Thus by reinforcing the psyche by means of psychotherapy we obtain therapeutic results through the mechanism of constitutional treatment.

Psychotherapy is a major biological or constitutional treatment, and its significance has been enhanced by the recent demonstration of the physiological connexion between psycho-associational cortex, vegetative nervous system and endocrines, and thus between the psvcho-associational cortex and all organs and tissues of the body. Dietotherapy, which looms so large in Hippocratic medicine, also has been developed on biological or constitutional lines. The aim of modern dietotherapy is the strengthening of the constitution, and to do this we look at the whole man and not at a diseased organ. In chronic nephritis, for example, until a few years ago the object was to spare the kidney, and thus we reached the method summarized in the saying of a French clinician: “Milk or death”.

> ***“Dietary Hygiene. Milk is the Food and Medicine par excellence for Bright's disease. In short, every effort must be made to make the patient and those around them understand that Milk Is The “sine qua non” of treatment: Without Milk, there is no Salvation, or, as we have sometimes been forced to say, it is Milk or Death. Diet for Hyperchlorhydric Patients: At the height of hyperchlorhydria, that which corresponds to the round ulcer of the stomach, the only applicable diet is the Milk Diet, as Cruveilhier was the first to point out. And the Importance of Milk is such in this disease that it is expressed by this phrase: Milk or Death.”*** *- in “Bulletin Général de Thérapeutique Médicale et Chirurgicale”, 1894.*

[Hypochlorhydria is condition where the stomach does not produce enough hydrochloric acid to maintain a properly acidic environment, leading to issues with food digestion and nutrient absorption. Common symptoms include bloating, gas, indigestion, and sometimes constipation or diarrhoea, which result from bacteria overgrowth and undigested food.]

Nowadays we look on the whole man and endeavour to improve his constitution by giving those elements of nutrition which qualitatively and quantitatively maintain his strength. Disintoxication, and nervous sedation by these means put the patient in better condition to fight his disease and through these general means, as Dr Bernhard Aschner, MD, has shown, many local diseases can be treated. Aschner, has developed this mode of constitutional therapy in a series of publications that have had great success in German-speaking countries. He reintroduced the alterants, laxatives, and nervous sedatives used by our ancestors, chiefly by Paracelsus, and has obtained good results in gynecological affections and in other local diseases. Mohr in his Psychotherapy in Organic Disease, reports that a well-known gynecologist reduced his operations by 50%, since having recourse to psychotherapy. Even this proportion gives promise of further reduction thanks to the introduction of Endocrinotherapy, as the internist endocrinologist Maranon shows in his Gynecologia Endocrina." - Dr A. P. Cawapias, MD, in "Neohippocratism", Proceedings of the Royal Society of Medicine, 1938.

Biophysiological Phenomena

Biophysiological Phenomena are the Physical and Physiological Processes in Biological Systems.

Metabolism

All Biochemical Reactions of processes taking place in the living organisms have 2 Interwoven Aspects:

1. Anabolism: When living organisms synthesise complex organic molecules from simple molecules. It is the constructive phase of metabolism like the formation of proteins from amino acids.

2. Catabolism: It is a process of breaking down complex organic molecules from simple molecules to release energy.

Metabolism takes place in a controlled manner at body temperature.

In this process Enzymes Act as Bio-Catalysts. The energy that releases is stored, and it is further used for growth and development.

The Process of Elimination of Waste Metabolic Products; is called Excretion: Every cell, in our bodies, is impacted by photon of energy, by the subtlest of Bioenergetic Forces; these fundamental, massless elementary particles of light, and all other forms of electromagnetic radiation, serving as the quantum of the electromagnetic field.

The Immune System is a Bioelectric, Biomagnetic, and Biochemical Process

The Immune System acts as a Bioelectric Network where cellular membrane potentials and electric signals regulate immune cell behaviour, such as: macrophage migration, and activation, to fight infections, and aid in tissue regeneration. This Bioelectric Control, often termed the Neuro-Immune Axis, uses voltage-gated channels to communicate, bridging regeneration and pathogen. Changing the natural electrical signaling that exists in cells outside the nervous system; can improve resistance to life-threatening bacterial infections.

Disease

Organic Disease; is the manifestation of Toxaemia in a particular manner in any of the body tissues and body systems. Its cure can be achieved by following a Treatment Protocol in which encompasses both Therapeutics and Diet. Thus allowing for the restoration of normal health, and proper bodily functions.

Healing

Healing; means "to make whole"; is the process of the restoration of health from an unbalanced, or damaged organism. With organic or physical damage suffered by an organism, healing involves the repair of living tissue, organs and the biological system as a whole and resumption of normal functioning. It is the process by which the cells in the body regenerate and repair; to reduce the size of a damaged or necrotic area and replace it with new living tissue, by regeneration in which the necrotic cells are replaced by new cells that form similar tissue as was originally there. All organs will heal.

Electrical Changes in Tissues

"The Electro-Dynamical theory of growth, may alter all our conventional theories about the structure and the Operating Forces of the Human Body, as well as of all other living things both animal and vegetable. The Electrical Forces are predominant in cell-division, and obey well-recognised electrical law.

Films and interfaces within the cell, play their rapid release resistances or attractions to forces separated or immediately coalescing and are gone again. And ever on their surfaces the twin forces of Phosphorus and Oxygen come into fresh play, and energy, sign, and chemical-electrical affinities are determined.

The relations of each cell with its neighbours and with the fluid surrounding it are governed by the same law of equilibrium of the forces regulating that

environment. And the optimum conditions for the cell are determined by these concentrations and that environment. Provision is made within and without each cell for chemical changes made possible only by the action of equilibrated electrical charges determined by solar frequencies controlled by specific light-screens, by the provision of adequate Oxygen supply, Electrically activated by Ultra-Violet, and other chemical rays, and by the fluorescent activities of the individual fluids and cell constituents. We have seen the provision also for electrical capacity, electrical conservation, and electro-motive force, in the universal distribution of phosphatides and inorganic ions, universal, yet specific within each cell. We have seen the same control, by Positive and Negative Ions of Hydrogen and Hydroxyl, of the loose chemical combinations in the synthesis and hydrolysis of cell activity. We have studied the lipoid antitoxin barrier of the cholesterols and estimated the dielectric functions of these and other substances in conserving Electrical Equilibrium alike in cells, and in organs and body as a whole. We have seen that wonderful provision has been made for the generation, storage, control, and Equilibrium of Electromotive Force everywhere and at all times. These Electrochemical reactions we have found to be accelerated at body-temperatures by the presence of Enzymes or catalysts obeying the same law of the equilibrium-constant, whose exact character, whether: Electro-Chemical, Photo-Chemical, or Photo-Electrical merely, is not yet understood. We have realised the interdependence of cell-constitution, Oxygen provision, Light, and Electrical Forces.

And under carefully safeguarded conditions of testing we have satisfied ourselves that in the galvanometric readings of the Electromagnetic field of the body we have a ready means of estimating the physiological and pathological conditions of metabolism which determine health and all departures from health. We have examined the conditions of environment of the body, as of the cell, and we have, alike in plant and animal, watched the effects of: Nutrition, Light, and Oxygen; and we have contrasted the optimum conditions of the creatures of the wild with the unfitness and degeneration resulting from unnatural conditions of living. In our study of disease processes we shall keep this law of equilibrium of cell and body constantly before us, and, striving to understand their many and varied manifestations in the body, see whether we cannot arrive at a wider yet more exact appreciation of the nature, and origin of those conditions which are the stamp of the creature whose personal and relative equilibrium has been interfered with, and which we designate Disease." - Dr A. White Robertson, LRCP, S. Edin., in "Studies in Electro-Pathology", 1918.

Catalysts, Enzymes And Ferments

"We have seen in the study of Photo-Chemical Reactions that the Action of Light is similar to that of a High Temperature. We now have to discuss a **group of inorganic and organic units or systems which present certain points in common with photo-chemical, and electrical laws. The chemical processes which take place in the living organism**, says Bayliss (1915), from whose chapter on "Catalysts and Enzymes" I must quote, are of a kind such as in the laboratory can only be brought about by powerful reagents and high temperatures. Take the hydrolysis of protein to amino-acids. This is effected in the laboratory by boiling concentrated hydrochloric acid, but in the organism it takes place, at an equal rate, at ordinary temperatures, and in a medium which is only just faintly alkaline or neutral. The first discovery was that of Kirchhof (1812), that by the action of dilute sulphuric acid starch could be converted into glucose. In this reaction the acid is itself unchanged and can be recovered at the end of the reaction. Thénard noticed that hydrogen peroxide was decomposed not only by soluble alkalies but also by many various kinds of solid insoluble substances, such as manganese peroxide, silver, platinum, and blood fibrin. These do not themselves take part in the compounds formed, but remain unaltered. A point of significance in view of the mode of action of catalysts is that **they exercise a powerful action even when present in very minute amounts.** The reaction of a catalyst is both hydrolytic and synthetic, and this action is known as reversible reaction, so that synthesis and hydrolysis go on together until a point is reached where the position of equilibrium is reached, when the two reactions are proceeding at an equal rate. This position of equilibrium under a particular kind of catalyst is not affected by the amount of the catalyst present. The time taken to attain equilibrium is shorter with the larger concentration of catalyst. In what are known as heterogeneous systems - and these include the colloidal states - we have to deal with 3 factors: **rate of diffusion, absorption, and chemical reaction proper.** The catalytic action will then, if the other components are in true solution, be determined in time of equilibration by the absorption rate on the superficies of the solid particles of the catalyst. **Enzymes may be shortly defined as the catalysts produced by living organisms** (in yeast). Thus Von Wittich (1872) came to the conclusion that pepsin merely accelerates the action of hydrochloric acid on fibrin. The substance on which the enzyme acts is generally known as the "substrate." **The only really essential property of a catalyst is that it changes the rate of a reaction, including the starting of one which does not appear to proceed of itself, and without entering as a constituent into the final chemical equilibrium.** Enzymes may be specific in that the catalyst appears to act upon a limited number of substrates only; others, again, like emulsin on the β-Glucosides which are almost innumerable in number, show little specificity. They vary also in their sensibility to heat. As a rule they are said to be coagulated or precipitated by heat. In practice this property is frequently useful in deciding the nature of a particular agent. If the action is stopped by moderate heat, say up to that of boiling water, it is almost certainly due to an enzyme or to the action of living protoplasm, using this latter name for the present as a cloak for ignorance. It is found that the solution of an enzyme is found to lose its activity if kept, and that, while the rate of loss varies with the individual enzyme, it is accelerated by rise of temperature. Adsorption by substrate will [Bayliss and Starling, 1903; Vernon, 1904], however, considerably decrease the rate, although not wholly preventing it. Enzymes are injured more or less rapidly by rise of temperature, and the optimum temperature is that at which the acceleration due to rise of temperature is in greatest excess over the simultaneous destruction of the enzyme. **Most enzymes are extraordinarily sensitive to changes of hydrogen ion concentration. This is a common property of the colloidal state and points to the intervention of electrical charge.** In trypsin digestion, which is inactive except in slightly alkaline reaction, the reaction is brought to a stop or much retarded by the concentration of hydrogen ions or the diminution of hydroxyl ions. **This can be restored by the addition of alkali.** Similarly pepsin is inactive in hydroxyl ion concentration. Amylase, on the other hand, requires neutral salts.

Physical Properties of Enzymes

They are all in the colloidal state in solution, and do not diffuse readily.

They are all destroyed by moderate heat. As colloids they have an electrical charge varying with the electrolytes present with them: their activity is retarded or suspended in concentrations of hydrogen or hydroxyl ions inimical to them.

This electrical charge appears to play a part in the mechanism of their action. Many, if not all, are optically active.

Chemical Nature of Enzymes

This is unknown. They are not proteids and, according to Beijerinck, cannot serve as nitrogen food for bacteria or yeast.

> ***"It is probable that, like inorganic catalysts, they are of very varied chemical nature***, *but what this is cannot as yet be stated definitely in respect of any one of them." - Dr William Bayliss, MD, in "Principles of General Physiology", 1915.*

Enzymes act at their Surfaces

Electrolytes behave in this process in the same way as in electrical adsorption, as shown by Bayliss in the case of trypsin (Bayliss, 1911).

If the enzyme and the substrate are both negatively charged a certain obstacle to adsorption exists, since, if it took place, it would increase the Electrical Energy of the surface. If a bivalent ion, say of Calcium, is present, the charge on the surface is reversed and adsorption facilitated. In this way the favourable action of electrolytes in many cases can be explained. Adsorption thus favours acceleration by increasing mass action in unit volume.

There appears to be some evidence that enzymes may make their appearance in response to the presence of an appropriate stimulus or rather substrate.

Thus Duclaux (1899) stated that penicillium glaucum, grown on different media, produced enzymes which hydrolysed these media, enzymes which were absent in other cases.

These appear to be the chief points known, briefly stated, about the nature and origin of enzymes. We are still in the dark as to their elementary nature.

We do not know whether they have a chemical composition or whether they are, as Berzelius said of them in 1887, "a force which differs from those hitherto known.''

They accelerate a chemical change but are not found in the compounds formed, and they are not lost. They act in so minute a quantity that it is impossible to give them a purely chemical significance in the reactions they hasten.

Heat is sufficient to destroy them, and they are known to act on their surfaces, recalling the fact that electrical conductors like copper rods are also charged on their surfaces. They are influenced profoundly by electrical charge and sign, and by the relative concentration of electrolytes in their neighbourhood.

They are reversible in their action, alike synthetic and hydrolytic, as a current along a wire sets up reverse current in a parallel strand. Their action is hastened by diffusion and adsorption (concentration in mass of unit volume) as an electric charge is condensed upon the surface of a condenser plate.

And their colloid "constitution" is of such a complex lipoid-proteidelectrolyte structure as is the structure of all protoplasmic cells. They are optically active, and **they are affected by light and moisture as well as by heat.**

Let us now turn to the cell, its structure, its phases, and its metabolism and activities." - Dr A. White Robertson, LRCP, S. Edin., in "Studies in Electro-Pathology", 1918.

Chapter 1

Emunctology Principles of Treatment

The Usefulness of the Scientific Methods, And Its Well Established Physiological Principles of The Emunctology Treatment. First Cleanse both the Liver and Colon, then Identify and Remove: All Foci of Infection from the individual, applying all that which was Learned in Emunctology School, thus;

1 - The Paramount Importance of the Cleansing of the Liver

The Emunctologist must Cleanse the Liver, this done by Hydropathy packs.

> ***"Hydropathy: The significance of Hydrotherapy for medicine begins with its physiological foundation by Winternitz. The Application and Clinical Use of this Most Powerful of all Physical Healing Factors, now lies before us in Decades of Experience and Research, and demands, with almost elemental force, its integration into Modern Therapy. It was Von Leyden's great achievement for Germany to have granted them full citizenship in science as well, and it is to his initiative that we owe the practical introduction of Hydrotherapy into the field of work and the curriculum of the clinic. Only here can this discipline be precisely tested, guided, and promoted; only from here should it be brought into the circles of practising physicians and become common scientific knowledge. The indispensable prerequisite for this is the establishment of Clinical Hydrotherapy Institutes, the awarding of teaching positions in this field, and its gradual inclusion in examination subjects. The Prussian State has earned the commendable merit of having made pioneering progress in this direction and paving the way with the creation of a Hydrotherapy Institute at the University of Berlin."*** *- Dr Julian Marcuse, MD, in "Zeitschrift für Diätetische und Physikalische Therapie", 1902.*

> ***"Immunity means that: No Abnormal Cell can grow or develop in the body with Normal Metabolism. For that purpose, the degree of restoration of the Liver Plays a Decisive Role."*** *- Dr Max Gerson, MD, in "A Cancer Therapy", 1958.*

> ***Hepatic Circulation: - "The Liver receives a Dual Blood Supply of Oxygenated Blood from the Hepatic Artery, and Deoxygenated Blood from the Portal Vein and Mesenteric Circulation."*** *- in "Clinics in Liver Disease", May 2019.*

Concerning The Reflex Disorders Types of Organic Affections Upon The Nervous System

> *“The reason is that in spite of the **differences between them Hysterical Manifestations and Reflex Disorders produce identical sequelae, have points of contact, have been and still are frequently confused and are often associated, with the result that a profound knowledge of the one is necessary in order to understand the other. In this respect one may compare Reflex Disorders with Organic Affections of the Nervous System**, which were very often confounded with hysteria in the days when the objective signs, now well recognised, were not at our disposal.” - in “Hysteria or Pithiatism, and Reflex Nervous Disorders in the Neurology of War”, 1918.*

Concerning Hygiene As A Therapeutic Agent In The Treatment of Disease

“I wish to restrict myself to what might be designated as Therapeutic Hygiene; or Hygiene as a Therapeutic Agent in the Treatment of Disease. I wish to emphasise the Essentials of Hygienic Treatment, in as far as they concern the physician in clinical work. In the Treatment of Chronic Diseases the tide is turned in the patient's favour, By the Correction (of the Violation) of some Hygienic Principle. Many patients go from one physician to another, without receiving any benefit, until some simple phase of his case is discovered, that clears up the situation. It is notoriously a fact that the elementary truths of medical science, the simplest laws of health, are not infrequently disregarded by the physician who takes too much for granted in investigating his patient's case. 5 Clinicians in succession examined and treated a case of Epilepsy (woman). The patient became worse until an old practical country doctor took hold of the case, Stopped All Medication, made the patient Discard her High-Heeled Shoes, and thus cured her. Her Epilepsy was a Reflex Neurosis. The simple fundamental laws of health which culminate in the Hygienic Importance of: Open Air, Sun Light, Exercise in the Open, Proper Food, Cleanliness (personal hygiene), and Excretion (specially having daily bowel movement), have lost none of their importance. They have become more significant and necessary because the tendency of modern man is to deviate from the normal standard. The advice given to “get out more and take more exercise”, should be formulated by a deeply rooted and conscious appreciation of Air, Light, Exercise, Proper Food, Cleanliness, Excretion, as Therapeutic Agents of fixed value in a given case.” - Dr Otto Juettner, MD, in “Modern Physio-Therapy”, 1913.

The Pathology of Reflex Disorders And Its Treatment

"Therein lies the Pathology of the so-called Reflex Disorders.

The transmission of impulses of this kind follows the direction of least resistance. Why a certain path offers less resistance than any other and why, therefore, manifestations of a certain kind follow, is not easy to determine.

Therein lies the difficulty of accounting for these Reflex Disorders.

There is no doubt, however, that undue irritability of a nerve-fiber indicates a loss of resisting power or tone, and Is also an Evidence of Increase, Decrease or Perversion of Nutrition. Both Functional and Reflex Disorders, Are Only Secondarily Connected with the Activity of the Nerve-Mechanism. Primarily they must be Aberrations of Nerve-Nutrition; for reasons cited above. It is clear, therefore, that the study of Nutrition, and therefore, of the Blood, Is of Paramount Clinical Importance. The physician should remember at all times that the: Blood Is The Medium of Metabolism. It is the Carrier of Food, of Fuel, of Heat and of Waste according to certain Physiological Laws. It receives food through the lungs and through the stomach. It assumes different forms of consistency, composition and character in keeping with the activity of the different organs. It carries the food elements to the lungs and exposes them to oxidation. It deposits waste in the organs of excretion. Thus, we see that the Blood is the Factor upon which Metabolism hinges. If metabolism in any of its phases, or in any part of the body is disturbed, the blood is concerned primarily. Secretions may fail in their natural function and undergo chemical changes. Excretions and Combustion Products, May Be Retained, and again enter the circulation. All these substances are foreign to the physiological purposes of metabolism, and, therefore, are to all intents and purposes Poisons. Their presence in the body is equivalent to an Ischemia (inadequate blood supply to an organ or part of the body), and may give rise to an endless and numberless variety of symptoms of Poisoning Through Malnutrition (perverted nutrition) of the organism, wholly or in part.

This is what is meant by Auto-Intoxication, The Most Powerful, the most variable and the most neglected Etiological Factor in the Production of Disease and its Symptoms. It is the pathology of most so-called Functional and Reflex Disorders. It is the One Factor Which Explains the Clinical Features of Many Chronic Diseases. In Skin-Diseases, Auto-Intoxication of some sort or other; Is The Dominating Etiological Factor. Toxic Conditions of the Skin-Nerves; May Cause changes in the trophic condition of the skin.

The Disease may be Coincident with an intense Eliminative Effort made by the Skin. In all non-parasitic skin-diseases, The Condition of the Skin Is Secondary To The Toxic State which prevails within the system, and Finds its Outward Expression in the Cuticle. These Changes Are Secondary To The Actual Causative Factor, which precedes the disease of the skin: A Disturbance of local or general Metabolism. This explains the futility of local treatment in these cases, and liability to recurrence. In view of all these facts, we are prepared to understand the philosophy of the Hippocratic dictum; concerning the 4 Emunctories. The Prophylaxis of Disease Lies Largely In Physiological Excretion. The Cure of Disease (especially Chronic Disease); Depends on Our Relative Ability To Promote, Control, and Regulate Excretion. This is what gives Hydropathy, and Thermotherapy their Commanding Place in Clinical Medicine.

In All Chronic Diseases Auto-Intoxication is the One Factor, that Must Be Reckoned with, and Must Be Conquered.

With These Facts In Mind, We Are Able To Understand the Nature of Rheumatism, the Symptomatology of Many Diseases, and, above all, we are prepared to attempt the Treatment of Diseases of the Nervous System, that are so universally misinterpreted and unsuccessfully handled.

We are ready to admit that Functional and Reflex Disorders, have no pathological significance because: They Are invariably Secondary To, and Symptomatic of Some Underlying Disorder of Nutrition.

General and local Elimination, Is The Keynote of Treatment In All Functional Disorders. Irrigation of the Colon Is Indispensable.

In Most Persons the Colon Is a Stagnant Sewer, Full of Filth and Infection.

Metschnikoff believes that man, would live to an average age of 150 to 200 years, if it were not for the fact that he carries the germs of decay, and death, constantly in his Large Intestines. The Importance of Colon-Irrigation can not be overrated in cases of Functional Disorders, due to ill-defined causes.” - Dr Otto Juettner, MD, in “Modern Physio-Therapy”, 1913.

> ***“Our studies in Osteopathic Pathology, and Osteopathic Physiology; have led to certain conclusions which are of interest. First, that:***
>
> ***Osteopathic Lesions May Be Causative of Pathologic Change in Organs Distant from the Lesion; that this pathologic state may be causative of physiologic perversion, and that this in turn may have a far reaching effect.***
>
> ***Let us consider, for example, a lower thoracic lesion causing pathologic change in the kidney, causing a toxic state of the blood; causing optic and auditory nerve degeneration.”*** *- in “Journal of the American Osteopathic Association”, June, 1917.*

2 - The Paramount Importance of the Cleansing of the Colon

The Emunctologist must Clean the Colon, this done by Hydropathy Colon Irrigation. The Cleansing of the Body is Fundamental. For through the Colon many re-infections take place by overtaxing the system with drosses from fermentation.

THERE IS NO POINT ON TREATMENTS IF THE BODY SYSTEM IS IN A STATE OF TOXAEMIA, under the burden of Auto-Intoxication.

For, what point is there to give any treatment; if the White Blood Cells (the main defence mechanism of the body), are being destroyed by the very same Toxaemia. Also, what point is there on feeding the individual, if the state of Auto-Intoxication is present, and thus it is an impediment for the body to fully be able to absorb the very much needed nutrients, minerals and vitamins, provided by the food administered. For in such cases of individuals in a state of Emergency from Ill Health, the food given should be the Milk Diet first, followed by the Fruit Diet.

> ***"The First Component is the Detoxication of the Whole Body.***
> ***Which has to be carried out until all the Tumours are absorbed, and the essential organs of the body, are so far restored that they can take over this important "cleaning function" by themselves."***
> ***The Entire Intestinal Tract has to be Restored Simultaneously; with the restoration of the Intestinal Tract, the most important Secretory Functions will be repaired, as well as its Circulation and Motility Regulated by the Visceral Nervous System.***
> ***The deficiencies cannot be restored as long as the essential organs are poisoned."*** - *Dr Max Gerson, MD, in "A Cancer Therapy", 1958.*
>
> ***"Disease Can Only Be Cured By And Through the Blood, and its circulation in the living parts of the body. Any means that Improves: The Quality, The Quantity, and The Movement of the Blood, will assist in Eliminating Disease."*** - *Dr Charles Sanford Porter, MD, in "**Milk Diet as a Remedy for Chronic Disease**", 1923.*
>
> *Please see Chapter 13; Concerning:* ***The State of the Blood as a Major Factor in Disease.***

Natural Immunity to Disease is Primarily Due to the Presence of Chemical Substances Which Interfere with the Normal Oxidation Processes of the Cells

"Particular reference to the necessity of treating the patient As A Whole, and not as a mere assortment of unrelated parts; consequently, of regarding local symptoms as an indication on the part of Nature of her efforts to readjust a general disturbance of the body's functions.

Dr Mazel showed how this rational approach to disease treatment was shared by wise physicians of the past as well as by modern. Passing reference was also made to the illuminating theories of Dr William F. Koch, which, based upon the pure chemistry of the body, and borne out by clinical experience, showed that lack of **"Natural Immunity" to disease is primarily due to the presence of chemical substances of certain molecular structure which interfere with the normal oxidation processes of the cells and thus stimulate disordered growth or function of the organs concerned. Health was to be regained only by restoring the normal physiological oxidation mechanism of all the cells of the body; not by attacking or suppressing some local symptoms by which the disordered metabolism had made itself manifest. True Medicine, as the lecturer put it, was thus seen to deal with Life, the power behind the living body.**

As instances of the prevalent forms of repressive treatments Dr Mazel dealt first with the practice of heavy drug dosage, notably in cases of infectious fevers, and of skin disease; secondly, with surgery which skilfully removes offending organs that are the danger signals by which the body expresses its need of help, while often leaving the Underlying Toxic Condition Entirely Untouched. The tonsil, the appendix and the colon gave scope for the illustration of her argument.

Dr Maze discussed in a startling manner some of **the pernicious hygienic habits which are customarily imposed upon children, including over-clothing, sitting still in a chair, wrongly directed exercise, eating or drinking when not hungry or thirsty and too rapidly, Faulty Bowel Activity, and so on.**

Childish Ailments, were to be fought, not when the child is already ill, but in the antenatal period, or even before conception; by: Laying The Foundation of that Natural Immunity which will eventually become the heritage of those who follow the Natural Way of Living." - Dr Dorothy Mazel, M.R.c.S., in "Children and Repressive Treatments", Progress To-day — The Humanitarian and Anti-Vivisection Review, The Health Education and Research Council, April-June, 1937.

Biologic Immunity

"The Only Adequate and Effective Prophylaxis (treatment or action to prevent disease), lay in Biologic Immunity, through Blood Resistance, and opsonic stimulation. This side we ought to have considered, yet not have left the other side unconsidered. As a matter of fact, the intervention of the bacteriological factor did not alter the validity of the vasomotor factor; for the role of the vasomotor mechanism in the production of the cold was an established, clinical fact; and, I repeat once again, bacteriology cannot and does not alter clinical facts. By all means let us replace the word "'cold,"' and the morbid entity which it used to convey, by the word "infection," with all that the latter term implies.

By all means let us recognize and avail ourselves of the other side which bacteriology has opened up to us. But, cold or infection or whatever it be, we cannot, and we should not, get away from the clinical fact, established by years of occurrence and observation, that exposure to vasomotor disturbances does precipitate the disease. Dr John C. Rommel, in a communication to The Medical World, calls us back in timely fashion to this sensible viewpoint, and makes a strong plea for a more systematic play-up of the vasomotor element in the prophylaxis of colds. Nor does he stop at merely calling attention to the subject, but, like a good constructive critic, he propounds a practical method of applying the principle for which he contends. He urges a rational and systematic practice of "hardening" the skins of those persons who exhibit a special susceptibility to changes of temperature by means of treatment with cold water, cold air, and the wearing of lighter clothing, particularly the discarding of woolen underwear which, as he points out, irritates the skin and keeps it in a continued state of relaxation." - in "Prophylaxis of Colds", The American Journal of Clinical Medicine, January 1915.

A Healthy State of the Blood Provides Natural Immunity to Infection

"It was soon found that Bacteria Eliminated Toxins, and that Blood Possessed Protecting Properties Which Varied at Different Times. Virchow noticed the Ameboid Movements of Leucocytes, and Their Ability to Take Up Inert Particles. Mettschnikoff, in 1887, evolved the phogocytic idea, that leucocytes by chemotoxis were drawn to an infected site and took up the invading micro-organisms. Buchner, in 1888, showed that blood serum contained bacteriocidal properties and called the agents within the blood bacterio-lysins.

Vaughan in 1891, concluded that Immunity Depended on the Existence of Certain Proteid Substances in Blood Serum. These proteids have been called by different observers germicidal globulins, neucleins, defensive proteids and alexins. These Antibodies are supposed to be proteid substances, and Destroy or Neutralize Bacteria and Their Toxins. Depending on their actions the various antibodies are designated anti-toxins, lysins, precipitans, cytolysins and agglutinins. The side chain theory of Erlilich in 1897 was given as an explanation of the action of antibodies.

This theory was founded on the physiology of cell nutrition and is that each body cell has a peculiar affinity for its individual nutrient molecule, by means of imaginary appendages named receptors, which combine only with molecules possessing like appendages termed haptophores.

Now certain toxins may happen to possess like haptophores, as for instance, the tetanus toxins' affinity for brain cells.

When this latter combination takes place, the cell may die either from starvation, because the nutrient molecule is excluded or from toxin poisoning. When the toxins lack these haptophore appendages, this combination does not take place and we have a state of "Natural Immunity."

The side chain theory of Erlilich in 1897 was given as an explanation of the action of antibodies. This theory was founded on the physiology of cell nutrition and is that each body cell has a peculiar affinity for its individual nutrient molecule, by means of imaginary appendages named receptors, which combine only with molecules possessing like appendages termed haptophores.

Now certain toxins may happen to possess like haptophores, as for instance, the tetanus toxins affinity for brain cells.

When this latter combination takes place, the cell may die either from starvation (because the nutrient molecule is excluded, or from toxin poisoning).

When the toxins lack these haptophore appendages, this combination does not take place and we have a state of "Natural Immunity."

If, however, the cell survives, it may be stimulated by the toxic irritation, to develop new receptor appendages, which combine with and neutralize more toxin haptophores, and we have "Acquired Immunity."

If this receptor formation becomes excessive, they may become detached from the cell and circulate in the blood stream ready to combine with the proper toxins. These free receptors are supposed to be the antibodies.

In 1895 Denys found that the blood serum contained an antibody which acted on bacteria and rendered them more susceptable to phagocytic action.

In 1902 Leischman began estimating phagocytic power by mixing equal parts

of blood and a watery emulsion of bacteria, incubating and counting the average number of organisms per leucocyte in a stained slide of this mixture.

In 1903 Wright and Douglas noticed that when a patient was inoculated with a small dose of a sterilized emulsion of bacteria this phagocytic power was increased. They named the antibodies responsible for this action opsonins and devised a method, which is a modification of Leischman's, to estimate the opsonic power or index. It is essential that the vaccines be made direct from the patients infection.

In conclusion, the writer would urge that where double infections exist they be treated simultaneously, since healing is not so apt to take place so long as either infection persists." - Dr B. W. Rhamy, MD, in "Opsonic Technique", Fort Wayne Medical Journal-Magazine, 1907.

The Cause and Cure of Cancer: Allergy and Infection

"The Oxidation Mechanism supplies the energy for all vital processes, and for every cell function, for cell growth, repair, and for the phenomena of immunity.

This same Oxidation Mechanism burns up the Poisons that interfere with cell function and growth, and thus it overcomes disease.

Indeed, The efficient activity of the catalysts of oxidation determines the state of health and immunity, and therefore their supply must be maintained and protected. Since Diseases often Obtain Entrance to the general economy through the Intestine, it is important to protect the catalase and peroxidase of the Intestinal Mucosa from destruction. Sulfides, certain amines, amides, and oximes that might be produced in the colon through bacterial activity in conjunction with faulty diet, and constipation are able to destroy these catalysts.

The various metals that inactivate these oxidation catalysts, as aluminium and bismuth are known to do, should also be avoided. Thus by guarding the main portals, great advantage can be gained in health maintenance.

So rapidly is confirmatory data being accumulated in our present day, that one may now discuss fully the chemical natures of allergy, immunity, and of the oxidation mechanism as we employ them to remove the basis of disease.

Only a Crippled Oxidation Mechanism is required to permit the entrance, development, and activity of the poisons at the bottom of allergy; and this suppression of oxidation can come about.

But the common catalase destroyers like aluminium, bismuth, hydrogen

sulphide, tannin, toxic amides, and other nitrogenous materials originating in a putrid Colon, and in Focal Infections, and also the exhaustion of catalase by fatigue and exposure play their part here just as they do in the preparation of the patient for such acute infections as Pneumonia, and Infantile Paralysis.

In all of the Allergies, including Cancer, the toxic agent is a product of comparatively anaerobic activity, be it produced in a plant, a germ, a spirochete, or from some metabolite in the body. The Toxic Activity may be multiple, and persist for years producing various allergic symptoms and tissue changes before an appropriate molecule has absorbed deeply enough into so primitive a structure as the reproductive mechanism to facilitate its acceptor behaviour.

Thus we often see years of: Allergic Headaches, Neuritis, Gastric Ulcer, Psoriasis, Arthritis, and the like, before a cancer growth comes (Koch, "Cancer And Its Allied Diseases", p.52, 1929).

Strangely enough, when the growth gets well under way the pregrowth symptoms are lessened in intensity or may disappear altogether, and the growth evidently serves as a detoxicating mechanism so far as these symptoms are concerned. But it, of course, produces other poisons incidental to its lost oxidation capacity, because it permits support to so many toxic organisms.

This protective function is secondary to the allergic cell divisions for with increase in the amount of colloidal cell substance; adsorption capacity is increased favouring detoxification of the rest of the body.

This factor is also facilitated by the deficiency in divalent cations and a lipoid in water phase of the cancer cell contents, whereby materials gain more ready entrance to the cancer cell than to normal cells.

What the cancer cell attempts in part, therefore, is to protect the body, and come back to normal by diluting its contained toxins through multiplication.

Malignancy is profoundly cyclic in its expressions: Psoriasis, Epilepsy, Insanity, and Asthma, are among the other allergies that share this quality most noticeably. I have seen severe cases recover without showing reaction, until after the recovery from the malignancy was fully established and then take place at the 72 week. Sometimes a recovery process will go on slowly for 4 years before it is completed (Koch, "Cancer And Its Allied Diseases", p.151, 1929).

The reaction fevers are to be attributed to the oxidation of materials absorbed from the growth as it undergoes digestion. But it is also to be attributed to the burning of accumulated polymerized fat and sugar products and other bodies that should have been burned up were the oxidation mechanism sufficient and unencumbered.

During the recovery the destroyed tissues are replaced with normal tissue

elements, and not with scar tissue, because there is no infection present to call for a scar tissue capsule, and in other parts of the body where scars had been present for many years following infection, such scars are absorbed and the deformity corrected in a major way. It makes no difference whether the destroyed part is a bone, the recto-vaginal wall, the uterus, the breast, the larynx, or the tongue, and even perhaps the retina and brain. We have seen them all undergo full repair to normal structure where visible, and with return of normal function.

Treatment Protocol

The diet should be selected to give adequate nutrition in dynamic factors but to avoid tannin, the terpenes of fruit skins and the acids that rob the colloids of their cations. These acids are mainly tartaric and oxalic. Animal proteins should be Avoided, because they supply the bacteria of the colon with nitrogenous material from which to make toxic amines, amides that inactivate or destroy the catalase and peroxidase of the tissues. Vegetables, Fruits and Whole Grain Cereals un-parboiled cereals (not processed, such as corn or oat flakes, not paraboiled) serve excellently (Citrus Fruits not to be given, nor taken on the same day as whole grain cereals). Narcotics and Anesthetics (any drug) of all kinds should be Avoided, for they injure the dispersion of the colloids and interfere with action of the co-enzyme hydrogen acceptor systems of oxidation. Aluminium utensils are prohibited.

Colon Lavage should be sufficient to make up for any elimination defects.

Milk of Magnesia can be used when required for catharsis.

The injection of the catalysts should be made intramuscularly after a few days of Colon Lavage, and liquid diet of apple juices (not green apples, and no seeds, but with the peel), and the raw or cooked vegetable juices (preferably purple carrots), only after which the solid diet is resumed.

The injection may be repeated twice at 14 intervals; of if a reaction or improvement is observed after the first or second injection the other may be omitted.

Conclusion

It should appear from what has been said; that in the development of a great variety of diseased states the Primary Causation Factor Is a Reduced Oxidation Catalysis.

Therefore; The Measure that Corrects This Defect Removes the Basis for Secondary Factors of Causation, and Must Play the Fundamental Role in the Recovery From All Diseases, be they: Infections, Allergies, or Metabolic Disturbances. Indeed, there is but One Essential Pathology, no matter what clinical picture the secondary causes are able to produce, and thus the complete correction of each of them depends upon the same activity, the Restoration of an Efficient, and Sufficient Oxidation Catalysis.

This is possible only by the action of a catalyst, that is more labile, and more energetic than any of the disease-causing toxins, hormones, vitamins, or other physiological catalysts." - Dr Wm. Frederick Koch, MD, in "Pathogenesis and immunity as conveyed by ethylene and carbonyl groups in the cause and cure of cancer, allergy and infection", Byron Sanitarium, London, Ontario, Canada, 18 August 1935; Hartford Connecticut Hospital, 1 December 1935; Hahnneman Hospital, Liverpool, England, 23 February 1937, American College of Proctology, in convention, Chicago, USA, 21 September 1937, published 1938.

Cancer of the Rectum

"The Rectum is lined with a thick and vascular mucosa Reticular tissue, is especially rich in lymphoid cells in many locations in the body. This tissue may occur isolated, or in small bundles. Connective tissue cells are found usually in the stomata or interspaces. There are 2 lymphatic systems of the rectum; the muscular and those of the mucosa. Those of the mucosa are of 2 types, one extending to the lower ends of the columns of Morgagni, the other above that level. The depressions between the columns are poor in lymph channels.

Another and outstanding preparation, that has come to the attention of the profession, with numerous reports from many physicians, in the successful cure of Cancers, is the Glycolyde or synthetic serum of Dr Wm. F. Koch.

The first case I treated with the "Koch Serum" has now arrived at the 3rd year since his first dose. He has had 3 doses at intervals of several months.

This was an annular obstructed rectum of the carcinoma type. The annular obstruction has been absorbed. There was a great deal of bowel distress, and that has not made much disturbance for some time. There are now only some small nodes, soft, and undergoing resolution. There was a great deal of tormina, dragging down feeling in the sacrum and frequent small passage of fluid-like stools, irritating in character. That has been brought under control. Now he has a fine appetite and gets around as usual, though not entirely free of all signs, but on the upgrade.

This case I had with me in Chicago at the Convention Clinic, and he was examined by several doctors present. With all of them I make it a rule to use a solution of Hydrochloric Acid with Essence of Pepsin, or Elixir of Lactopeptine. It makes a nice red mixture which is given in teaspoonful doses after each meal in half glass of water. One thing I have noticed, and it has also been reported by many others, is the relief from pain, tension and a recession of the cancer growth. In late cases with much pain, opiates may be used to effect, and Opium suppositories are also of much benefit for local use in the rectum.

The Bowel Washings; as advised by Dr Koch, Are Very Useful in reducing toxins, and their absorption, and also reduces flatus, the lessening of bacterial activity, and a colitis so peculiar to cancer. I believe that the great work of the Hendry-Connell Foundation, and of Dr Koch is in the right direction of an ultimate and final solution, of the real causes and cure of cancer. All reports seem to be that there is an increase of cancer cases and deaths therefrom, despite all orthodox efforts. It is well to explore new paths of thought and work.

Orthodoxy has not solved the problem." - Dr G. F. Messer, MD, in "Cancer of the Rectum", Journal of The National Proctologic Association, May 1941.

The Importance & Therapeutic Value of Colon Irrigation

"Large Numbers of Individuals Remain in Disturbed Mental and Physical Health; solely because of a failure to recognise the Colonic Tract As A Focus of Infection. Many eminent authorities agree, that the presence, and Absorption of Colonic Bacteria and Toxins Are Responsible for the Majority of Human Ailments. No other part of our body that brings about more deleterious effects upon our system than the Colon; and equally probable that no other port of our system has been so Uniformly Neglected. Large Proportion of these individuals Drift Into A State of more or less Complete Invalidism. Systemic Toxemia, from Intestinal Auto-Intoxication (Absorption of Poisons from the Bowel), and the resultant lowered resistance, has been proved responsible for many Focal Infections, and Disturbances of Metabolism. Efforts to treat this Endocrine Unbalance, are usually futile, Unless the Conditions That Deplete the Endocrine Glands are Removed. Mouth, Teeth, Sinuses, and Tonsils, may all be factors, but the basic cause in 80% of the cases will be found in the Large Bowel (The Colon). Later, as Toxemia increases and resistance is lowered, focal infections will flare up in the nose, throat, and elsewhere. So malfunction is frequently primary, and disease is secondary, and therefore Many Diseases Can Be Eliminated by the Restoration of Normal Functioning. We should assist our

patients to Pay More Attention to those Habits Concerning the Hygiene of their Gastro-Intestinal Canal, as the Continuous Absorption of Toxins from the Bowel, Saturates the System With Poisons. These Poisons which wreak their Damage on Every Organ, and Tissue of the body, reach even the Endocrine Glands, and cause serious disturbances. Many pages might be written of the causes, and the various existing conditions that lead to Faulty, Irregular, and Insufficient Elimination of Waste Material from the Intestinal Canal.

A few of these causes may be here mentioned:

1. Atomic conditions of the intestinal and abdominal musculature with associated ptosis;
2. Infections of the intestinal wall with associated spastic conditions;
3. Mechanical interferences with fecal expulsion, acute and chronic affections of liver, stomach, and intestines;
4. Errors in diet;
5. Diseases of the secretory organs,
6. Various diseases of the spinal cord.

One may have one, or more bowel movements a day, and still have Stasis in certain parts, or all parts of the large bowel; so regular bowel movements daily, do not rule out Intestinal Toxemia.

When the contents of the large bowel are unduly delayed in their passage to the anus, and remain long retained in the bowel, chemical changes take place in the feces, and many of the waste products are split up into Poisonous Substances or Toxins.

The Symptoms of a General Toxemia may be classified as follows:

1. Those referable to the Nervous System.
2. These patients have an Apathetic, careworn expression; they are cranky, crabid, and cynical; they are easily worried, and molehills of trouble seem like mountains.
3. Uncontrollable Crying spells arise without apparent reason.
4. Vasomotor Paresis; is evidenced by the Red Line that Appears upon the Skin after Scratching.
5. Cold hands and feet, some complain bitterly of the cold.

Other Symptoms are:

1. **Dizziness.**
2. **Insomnia.**
3. **Headaches.**
4. **Mental hebetude.**
5. **Fainting, or all gone sensations.**
6. **Neurasthenia.**
7. **Psychosthenia.**

And mental symptoms that may border on those of insanity:

1. **Neuritis.**
2. **Neuralgia.**
3. **Migraine.**
4. **Irritability.**
5. **Excessive mobility of temperament.**
6. **Depressed one day, buoyant and high spirited the next.**
7. **Over-kind, then brutal, and impossible to live with.**

Frequently Mental and Nervous Symptoms, had been the only complaint, no symptoms referable to the Intestinal Tract had ever been manifested.

Symptoms referable to Abdomen are:

1. **Sense of distension,**
2. **Usually epigastric,**
3. **And immediately after eating irregular attacks of nausea with or without vomiting,**
4. **Gaseous eructations,**
5. **So-called "bilious spells",**
6. **Dragging sensation with pain in back or loins,**
7. **Loss of appetite.**
8. **Dyspepsia.**
9. **Vague abdominal discomfort,**
10. **Bowels may move daily but inefficient;**
11. **Marked constipation and occasional diarrhoea; Constipation is the rule (but not always so).**

Then, too, there are the symptoms of:

1. Gastric and Duodenal Ulcers.
2. Enteritis.
3. Colitis.
4. Appendicitis.

Symptoms referable to the Circulation are:

1. Palpitation, a rapid overactive heart or a slow, weak muscled heart.
2. Cardiac irregularity from vagal irritation.
3. Missed beats.
4. Praecordial Anxiety.
5. High blood pressure usually (but may have a subnormal).
6. Secondary Anemia.
7. Shortness of breath.
8. Easily exhausted.
9. Vertigo.
10. Cerebral Anemia.
11. Sensation of Faintness.
12. Splanchnic Congestion.
13. Myocarditis.
14. Endocarditis.

Symptoms referable to the Muscles, and the joints are:
1. Painful and stiff muscles and joints, so-called Rheumatism and Arthritis.

The Skin symptoms are:

1. Urticaria.
2. Acne.
3. Boils.
4. Carbuncles.
5. Falling hair.
6. Baldness.
7. Herpes.
8. Pruritis.
9. Dermatitis.

The Eye symptoms are:

1. Painful Eyeballs.
2. Disturbances of Vision.
3. Sense of Distention.
4. Cataracts (toxic deposits in the lens).

The Genito-Urinary symptoms are:

1. Nephritis.
2. Pyelitis.
3. Cystitis.

The catalogue of conditions arising from absorptions from the Large Intestine is so long, that to name them would sound like over enthusiasm, if they were not vouched for by our greatest medical, and surgical men of today.

Sir Arbuthnot Lane, after listing, and discussing innumerable diseases, asserted that:

> ***"None of these conditions can arise, except in the presence of Intestinal Intoxication."*** *-*
> *Sir Arbuthnot Lane, Surgeon*

In High Blood Pressure - First we have a chronic intoxication, the endocrine glands become depleted, the detoxicating organs become inefficient, and we have a Chronic Intoxication, plus a Deficient Catabolism of the waste products of the body. These factors are the underlying causes of high blood pressure in the greatest percentage of cases.

Intestinal toxins act through irritation to the intima of the arterioles and the Vasometer Center, and produce toxic angio-spasm. The circulation of the toxins in the blood bring about an exaggerated vaso-constrictor irritability. This irritation plus the pulse violence eventually rob the arterial coats of their elasticity, and bring about other changes in the capillary walls.

These pathological changes interfere with the exchange between the blood and the tissue cells. Our body tissues are normally slightly alkaline.

When this degree of alkalinity is lessened illness results and dangerous conditions arise long before the neutral point is reached. Death occurs if it goes beyond the neutral point, even to the slightest degree.

The most common Symptoms of Acidosis are:

1. Headache.
2. Nausea or vomiting.
3. Lassitude.
4. Loss of Appetite.
5. Irritability.
6. Weakness.
7. Easily exhausted.
8. Muscular aches and pains.
9. Sour stomach.
10. Acid urine.
11. Mouth ulcers, and Ulcers of the Stomach.

Later Symptoms of Blood Vessel Changes, as:

1. High blood pressure.
2. Kidney.
3. Heart disease.

The most common cause of Acidosis can be found primarily in the Intestinal Tract where there is an excess production of acids that are the end products of protein putrefaction, carbohydrate fermentation, and food intoxications.

The co-existant Auto-Intoxication Depletes the Endocrines, and we have in addition to those Acids Formed in the Colon, an excess amount of acids, which are developed as the End Products of Disturbed Metabolism.

A condition results wherein there is not only an over-production of acids, but also a retarded elimination of them.

Diet Is Another Factor to Consider: for if there is an excess amount of acid ash foods partaken, and if they are improperly eliminated by the kidneys, there will gradually develop a greater degree of systematic acidity with a lessening of the alkalinity of the body. These cases either eat too much acid, or not enough alkaline ash foods to maintain a normal acid-base equilibrium.

The majority of acidosis cases can be prevented.

If already present, the patient can be Quickly Relieved by Colonic Flushing's which remove toxic wastes, and putrefactive organisms.

In addition to the Colonic Flushing's, prescribe sparingly of the acid ash foods, and these foods should be well balanced by alkaline ash foods.

The circulating Intestinal Toxins in the Blood, Act Upon the Bronchial Sensory end Organs of the Vagus.

These cause afferent impulses to be transmitted to the vagal center. Normally they would cause periodic contractions of the bronchi, but being hypersensitive the center projects violent stimuli to the bronchial muscles and mucosa, which causes broncho stenosis, which in turn causes the Asthma. The bronchial stenosis is due principally to the contraction of the bronchial muscles and congestive swelling of the bronchial mucous membrane. Bronchial Asthma is usually considered a Reflex Neurosis, and is due primarily to oversensitiveness, and irritability of the vagal center. It is most Commonly Brought About By the Absorption, and Circulation of the Intestinal Toxins.

Calcium Deficiency Causes Over-Excitement of the Nervous System.

The Calcium content of the blood is determined, and is kept at its required level by the internal secretions.

These Glands are usually depleted in cases of Intestinal Toxemia.

The following picture is seen: intestinal toxemia, irritation of vagal center by circulating toxins in the blood, depletion of the Endocrine Glands, gradually decreasing Calcium Fixation in the tissues, lowering of the auto-defensive functions, and an unrestrictive progressing Toxemia.

An essential progress in the treatment of Bronchial Asthma was registered with the introduction of Colonic Treatments: removing putrefactive products from the colon; re-establishing the endocrine balance; and stimulating the detoxicating organs.

Epilepsy is a Functional Nervous Disease, due to either:

1. Organic Lesions associated with pressure; or to
2. Functional derangements, due to a Toxemia; or as often is the case,
3. Due to both, that is, both conditions are present.

In the latter cases there is an excess of toxic wastes, and excessive vago-constriction, and often a rise in arterial tension. These indications call for the removal of toxic wastes by means of a Colonic Flushing to clear up the Auto-Intoxication, and prevent its recurrence. The reduction and proper selection of food is also of great value. Colon Irrigations are a quick, safe, and powerful means to stimulate the kidneys into action. This method has a more powerful diuretic action than any drug. Reports of some of our most prominent surgeons state that 80 % so-called chronic appendicitis should not be operated upon.

These conclusions were reached by post operative pathological examinations.

Colonic Irrigations, and Colonic Solutions overcome a general infection in the caecum and the symptoms disappear. The burden of caring for the absorbed toxins from the bowel falls upon the liver. The constant and ever increasing amount of toxins absorbed from the intestines sooner or later, exhausts the secretory and detoxicative functions of the liver. The most logical way of activating the Liver is to remove its burden by eliminating the absorption of toxic wastes from the bowel.

Colon Irrigation Is Valuable In The Treatment of:

1. Liver Problems.
2. Kidney Problems.
3. 80% of Appendicitis.
4. Toxic Sciatica.
5. High Blood Pressure.
6. Acidosis.
7. Bronchial Asthma.
8. Epilepsy.
9. Chronic Rheumatism.
10. Gout.
11. St. Vitus Dance (involuntary, rapid, jerky movements: chorea).
12. Arthritis.
13. Neuritis.
14. Painful and Stiff Muscles.
15. Migraines.
16. Neuralgias.

May become satisfactory (to physician and patient alike), if judicious Colonic Irrigation, and colonic medication be applied, in accordance with the demands of each individual case. Intestinal Intoxication will cause 80% of these conditions; and what could be more logical, than to remove the toxic wastes, overcome the General Toxemia, and Restore the Large Intestines to Normal Function and Vigour! Colonic Irrigations are now rational, effective and safe from untoward results. It is the Most Common Sense Way to Combat Intestinal Auto-Intoxication and Other Conditions which may have arisen because of Colonic Stasis and Infection. The Health and Correct Function of Every Organ in our System Depends Upon Proper Elimination of Waste and Toxic Products. Irrigations Are Indicated in Practically Every Diseased Condition, as They Establish Proper Elimination, as well as Remove a source of Toxemia, thus aiding to a great extent any other

treatment. Every modern hospital should have proper equipment, and trained technicians to give these treatments. A course of Colonic Irrigations, with toning up of the voluntary and involuntary musculature, is not only valuable in cases of definite disease conditions, but it will greatly raise the health standard, even of those who do not look upon themselves as sick. It is the most efficient method of adding years to the span of life." - Dr C. B. Lamp, MD, in "High Colonic Irrigations", The American Journal of Physical Therapy, July, 1929.

Colon Therapy

"In searching for the cause of Toxemias, and Chronic Infections often too much stress is placed upon certain etiological factors, passing by others of equal or even greater importance with little or no attention to them. Thousands of teeth and tonsils, gall bladders and appendixes have been removed in an endeavor to locate the cause. Recently more attention is being given to the large bowel, and simply marvelous results have been obtained by those who go at their work in a thorough and painstaking way.

Of the conditions which have responded in a greater or less degree to Colon Therapy may be mentioned:

1. **High, and Low Blood Pressure.**
2. **Arthritis.**
3. **Toxic Goitre.**
4. **Migraine.**
5. **Neurasthenia.**
6. **Anemia.**
7. **Asthma.**
8. **Epilepsy.**
9. **Nephritis.**
10. **And many skin diseases.**

Many times the etiology can be traced directly or indirectly to colon disorders.

When other measures have failed, certainly no harm can be done by trying Colonic Therapy. It is in some of these cases where you never expected results that you are liable to get most brilliant results.

The Treatment of Toxemias of Colonic Origin:

1. Cleanse the bowel, and keep it clean.

2. Change the Intestinal Flora.

3. Prescribe a Healthy Diet, which will produce the least toxins if subjected to putrefaction.

4. Correct the pathological conditions in the bowel." - Dr Wm. W. Worster, MD, in "Colonic Therapy", The American Journal of Physical Therapy December, 1929.

3 - The Paramount Importance of Removing All Foci of Infection

"Assuming that **all other Foci of Infection have been Taken Into Account in the Treatment of a Patient, and that there is not the decided response which was expected, there remains one of the Greatest Sources of Toxins in the Whole Body: The Stagnant Colon.**

The Colonic Irrigations rapidly eliminate the poisons, from the colon and provide a mechanical stimulus to the muscular walls.

Check all other possible sources of Foci Infection such as:

1. Teeth.
2. Tonsils.
3. Rectal Crypts.
4. etc.

We insist that the patient take proper breathing exercises and go to the stool by the clock each day. We should like to emphasize the remarkable results obtained in combining Colonic and Osteopathic Therapy, in the cases of Acute Infectious Diseases, and in some of the Acute Intestinal Disorders. Infectious Diseases of childhood respond much more quickly if the intestinal tract is thoroughly cleaned out, and Colonic Irrigations are much more effective than Enemas in this." - in "Making Osteopathy More Effective by the Use of Colonic Therapy", The Journal of the American Osteopathic Association, May 1934.

"Hayden, Rosenow, Lucas and House have established the fact that 80% of all foci of infection is found in the head. There are 44 sources of infection in the head and 32 of them are the teeth. A much greater percentage than 80% of all patients over 35 years of age showing foci of infection by chromography have some form of dental pathosis or oral infection as the main contributing cause of the infection. This is because of lowered resistance by natural metabolic changes. Therefore, it is obvious that after the chromographs reveal foci of infection and the extra ocular tests are completed along with the balance of the complete optometric diagnosis, the case is immediately referred to the oral

surgeon for further diagnosis and attention. The second group of cases showing foci of infection and second in importance in optometric diagnosis are cases of tonsilar origin. We would suspect the tonsils rather than the teeth to be the source of infection in all patients under 30 or 35 years of age and our chromographic evidence followed through confirms this statement.

Clinical analysis indicates that sinus infection is of far less importance than oral and tonsil infection.

While 80% of all Foci of Infection is found in the head there still exists a remainder of 20% of these cases of infection which optometrically we may say make up all abdominal disturbances resulting in infection.

In the locality in which I practice, these abdominal disturbances resulting in infection are important factors to be reckoned with in the study of chromographic evidence of foci of infection.

This is true in all localities where fresh green vegetables are easily obtained and eaten raw, but particularly in the parts of the country where these necessary vegetables are raised. Here those abdominal infections are many because of parasitic infection of the intestinal tract, especially amebic infection.

In a previous paper I mentioned the work being done by many of our modern authorities who are finding the intestinal tract to be the seat of a majority of all cases of foci of infection.

> ***"The entire alimentary tract is a reservoir and laboratory of poison."*** *- Dr W. E. Kessinger, MD*

I believe that if the intestinal tract is kept thoroughly cleansed and free from toxin then body tolerance or resistance to infection is raised so that the infections in other parts of the alimentary system and body are less severe and more easily cared for and removed; also it is more difficult for any toxic agent to lower resistance and gradually become a source of focal infection.

Therefore, I take no issue with these men endeavouring to prove the intestinal tract to be the original seat of foci of infection for it matters not which is the primary and which is the secondary infection if tolerance is reached and the chromographs are normal or toxic free.

As the Toxemia becomes more severe, the red field contracts and as the condition progresses to focal infection the green field contracts.

When the green field reveals foci of infection and the red field is somewhere near the expected norm or slightly contracted and the blue field is small or partly missing (overlapped) then the case is one of foci of infection of abdominal origin and almost invariably the infection may be located in the intestinal tract.

When Foci of Infection breaks resistance entirely, all of the fields will eventually collapse so that they are well within the 15 degree circle, then our evidence is simply Foci of Infection, and that Focal Infection is localized by the process of elimination, exclusion of optometric evidence, diagnosis by the oral

surgeon, and then diagnosis by the diagnostician of internal medicine, or the physician and the abdominal specialist. The Foci of Infection may be listed among those 80% of all cases of Foci of Infection located above the neck and in the head or throat, or the infection may be found in that 20% of cases of foci of infection of abdominal origin and found any place within the abdominal cavity, and may be functional or organic but probably functional. Optometric diagnosis revealed a C, type of case with a chain of toxic interference. Chromography showed Foci of Infection. The patient was referred to the oral surgeon and two impacted third molars and a nonvital cuspid were removed. The chromographs showed an improvement but still revealed a lack of resistance. Another complete physical examination at my insistence resulted in a tonsillectomy. Two weeks after the tonsillectomy chromography revealed normal graphs and good resistance. Orthoptics completed this case and now the patient is assured of eye comfort and safe in the knowledge that the foci of infection which would have continued to contribute to ocular discomfort, with the end result of ocular pathosis or a physical "crack up" has been alleviated.

This patient has a history of poor health throughout her life. She seems a poor risk for foreign service and yet the medical board had pronounced her fit.

As I have stated in a previous paper, 80% of all focal infection is found in the head (Hayden, Rosenow, Lucas) and a much greater percentage than 80% of all patients over 35 years of age showing foci of infection by chromography have some form of dental pathosis or oral infection as the main contributing cause of the infection, therefore, it was obvious that this patient be referred to the oral surgeon. In November and December 1935, 10 patients were referred to me for chromographic examination. 7 of these cases revealed foci of infection, 2 abdominal toxemia and one showed foci of infection and abdominal toxemia.

All 10 cases were found to have ocular involvements causing symptoms of discomfort but were referred for chromographic evidence alone." - Dr Donald J. Mayer, OD, in "The Diagnosis of Foci of Infection by Chromography", American Journal of Optometry, June 1936.

Dental Foci of Infection in Body Diseases

"In 1910 an English physician, William Hunter, indicted American dentistry for the systemic pathology engendered by gold crowns and septic bridgework.

During this same period of crude bacteriologic technics and infrequent roentgenographic examinations Frank Billings and Edward C. Rosenow advanced the theory that Dental Foci of Infection Were Implicated in the Causation of A Number of Systemic Conditions, Particularly in Diseased Conditions of the Joints.

The Relation of Dental Foci of Infection to Systemic Disease

In the spring of 1949, P. S. Hench Reported the Startling Remission of

Symptoms in patients hospitalized for the Treatment of Rheumatoid Arthritis and thereby provided the health professions with a new and intriguing technic of research into the baffling Etiology of a Number of Systemic Disorders.

Much Has Been Written about The Relation of Dental Foci of Infection to Specific Types of Systemic Disease. The Earlier Literature Particularly Reported Many Instances in which Diseases of the Joints, Heart, Kidneys, and Eyes, Were Cured, or Relieved By The Removal of Dental Foci of Infection." - in "The Journal of the American Dental Association", 1951.

Foci Infection in Psychiatric Patients

> ***"The Causal Relationship of Foci of Infection to General Systemic Diseases Was Recognized by Benjamin Rush in 1819 in a case of Arthritis Which Recovered After Removal of Dental Infection. In Pemberton's study of 100 consecutive hospital admissions, he found the Dental and Nose and Throat Foci of Infection to be about the same in incidence (58% and 56%). Dental Foci of Infection were present in a little over 33% of our patients, while 66% of our patients needed Dental Treatment. The next most common focus of infection lay in the Genito-Urinary Tract (22% and 17%) in our study. The most common Foci of Infection in the mouth are in apical or alveolar abscesses in dead or carious teeth, or in root fragments (30%). The diagnosis of apical abscess was based on dental examinations and Roentgen rays. The next most common Focus of Infection in the mouth was pyorrhea (15%). It is striking that 2/3 of our patients Needed Dental Attention of some sort, and that 36% of our group had Dental Caries. Urologic Foci of Infection were found to be present in 17% of the 100 cases examined; 16% had Chronic Prostatitis, 2% non-specific Urethritis and 1% Cry Otitia. Of our paretic patients 33% had a Focus of Infection in the Genito-urinary tract, while only 10% of all our other cases had such an infection. Summary and Conclusions: 239 patients who were hospitalized because of Mental rather than Physical illness, were studied for Foci of Infection. Of these cases, 62.8% Had Foci of Infection Present. It is obvious, with the high incidence of Foci of Infection in physically normal patients, that every patient should have a very careful examination for Foci of Infection. The most common sites of Foci of Infection in our study were the nose and throat (44%), Dental (37%), Gynecologic (22%), Urologic (17%), and Cardiorespiratory (1.6%). The most common nose and throat infection were chronic tonsillitis and chronic sinusitis. The Most Common Dental Infections were Apical Abscesses and Pyorrhea."*** *- in* ***"Foci of Infection in Psychiatric Patients",*** *The American Journal of the Medical Sciences, April 1940.*

"These case reports almost universally agree that the removal of foci of infection produces distinct benefits in the treatment of disease. The removal of foci of infection aids or cures certain diseases." *- in "Journal of Dental Research", February 1931.*

"Certainly physicians, when diseases due to focal infections are present, inform cooperating dentists to eradicate all possible dental foci of infection as thoroughly as possible by whatever methods they consider necessary or advisable. Not infrequently the extirpation or drainage of primary foci of infection is of therapeutic value, affording relief from the conditions and diseases due to focal infection with subsequent improvement in general health." *- in "The Journal of the American Dental Association", August 1952.*

"Enough is known, however, to make certain that the first step in the treatment is to remove the chronic foci of infection. We have seen many recoveries among the acute psychoses occur in 1 day or 2 after the removal of the chronic foci of infection.
It is evident from these considerations that the interpretation of the so-called functional mental disorders is following the course already taken in functional diseases of other organs, i.e., that we have to recognize the physical nature of the disturbance. Practically all of them have impacted molars and other infected teeth.
All of them have infected tonsils. A certain number also have involvement of the gastro-intestinal tract, and infected cervices are not uncommon. The removal of these foci of infection has resulted in marked improvement in these individuals and many of them have been able to leave the hospital and return to their homes and employment and have continued to do well. There is, undoubtedly, some disturbance of the internal secretions which may be caused by chronic foci of infection. It is not only necessary to look out for contagious diseases, malnutrition, etc., but the hidden foci of infection should be located and eliminated." *- in "The defective delinquent and insane, the relation of focal infections to their causation, treatment and prevention", 1921.*

"Perhaps the most common sites for focal infection are the teeth, jaws, tonsils, mastoids, and sinuses generally. Chronic infection of the upper portion of the lungs, the gastro-intestinal tract including the appendix, and the genito-urinary tract is not uncommon. Teeth are bone-like structures set in bone, but they should never be thought of as having an independent existence. As a matter of fact, the peridental membrane and surrounding alveolar structures are amply supplied with blood-vessels and lymphatics connected with the general circulation. This means that bacteria which attack and break down the peridental membrane of a tooth may forthwith be transmitted through the blood-vessels and lymphatics to other organs of the body,

> ***lodging as far away as the kidneys, the knee-joints, etc. It is precisely because infections from teeth may thus be conveyed to other organs of the body that the subject of focal infection is of such importance."*** *- in "Why infections in teeth, tonsils and other organs ", 1926.*

Oral Foci of Infection

"Focal Infection appears to have some injurious effect on the thyroid gland, either directly by means of bacteria or their toxins or their influence on iodine metabolism.

Olsen & Taylor observed a Relationship Between Defective Teeth, and Diseased Tonsils in patients in whom there was no Iodine Deficiency.

Lintz found that 50% of the goiter patients he examined had either infected or extracted teeth, while in the control group the incidence was only 17%.

Specific cases have been reported in which Hyperactive Thyroids were aggravated by Oral Infections, and were Relieved by their Elimination.

Oral Foci of Infection may aggravate a Hyperthyroid condition or result in exacerbations of symptoms associated with hyperfunction of this gland.

A Focus of Infection may act:

1. **As a depot from which bacteria; or their products may be disseminated to remote areas of the body.**
2. **As an area in which organisms from other parts of the body may localize.**
3. **As an additional load on the general resistance of the individual.**

A Focus of Infection may be of systemic importance in one or more of these ways.

Oral Foci of Infection include:

1. **Periodontal foci.**
2. **Periapical foci, including residual areas of infection in edentulous spaces (or jaws).**
3. **The infected vital pulp."** - in "Oral Medicine Diagnosis and Treatment", 1957.

4 - The Paramount Importance of the Advise on Proper Food Choices

The Emunctologist must advise on proper Food Choices, and the combination of same.

> ***"Food certainly has some influence, both through the amount taken and variations in the kind of Food, and one may assume that Poisons present in the Blood on their way to Excretion or destruction must have some effect. These Poisons may be metabolic or absorbed from Bacteria present in the Hollow Viscera. But if these are the only factors, it is curious that they should be so well balanced."*** *- in "British Medical Journal", 2 October 1926.*

The Concept of Totality

> ***"We Should Not Forget that a Body Detoxifies Constantly Through the Liver, and The Best Nutrition Can Maintain an Active Metabolism with the Help of the Liver.***
> ***Thus, The Concept of Totality, will be obeyed in medicine, as It Is Active in Other Living and Non-Living Processes of Nature. The Same Is True In The Field of Nutrition. A Knowledge of the Interrelationships Among Nutrients in a Diet Is Essential. Utilization of One Nutrient May be profoundly Affected by the presence or absence of Another. An Excess or a Shortage of one or more other Nutrients which Interfere with the normal Metabolism of the essential dietary constituent.***
> ***A healthy body can adapt itself to different types of nutrition. It reabsorbs the necessary minerals, vitamins and enzymes as we know from experiments to determine the time for the clinical appearance of one or another vitamin deficiency.***
> ***A sick body has lost this capacity. The Deficiencies Cannot Be Restored As Long As The Essential Organs Are Poisoned. That is true in Cancer also, as demonstrated by Clinical Observations. Cancer Will Be Prevented And Can Be Cured if we learn to Understand the eternal Laws of Totality in Nature, and in our Body."*** *- Dr Max Gerson, MD, in "A Cancer Therapy", 1958.*

Interrelationships Among Nutrients

For example; **Calcium Carbonate, to be absorbed needs both Vitamin D and Magnesium; for their absorption are interconnected. Vitamin D is Essential for Calcium Absorption, and Magnesium helps convert Vitamin D, into its active form, and is involved in the transport of Calcium within cells.**

> ***"Nutrients usually act in a coordinated manner in the body. Intestinal absorption and subsequent metabolism of a particular nutrient, to a certain extent, is dependent on the availability of other nutrients. Magnesium and Vitamin D, are 2 essential nutrients that are necessary for the physiologic functions of various organs. Magnesium assists in the activation of Vitamin D, which helps regulate Calcium and phosphate homeostasis to influence the growth and maintenance of bones. All of the enzymes that metabolize Vitamin D seem to require Magnesium, which acts as a cofactor in the enzymatic reactions in the liver and kidneys. Deficiency in either of these nutrients is reported to be associated with various disorders, such as skeletal deformities, cardiovascular diseases, and metabolic syndrome. It is therefore essential to ensure that the recommended amount of Magnesium is consumed to obtain the optimal benefits of Vitamin D."*** *- in "Role of Magnesium in Vitamin D Activation and Function", Journal of the American Osteopathic Association, 1 March 2018.*

There should be less of inclinations for the individual to so act towards food, drink or activity of any nature, as to cause greater disturbance to the system; as getting too cold or too hot, or the feet becoming damp, or the head and neck and shoulders under draft, or overindulgence in food of the nature that is a reactory influence upon the lower hepatic circulation.

A Note on the Emunctory System

> *The Emunctories, are the Sum of all Organ System in the physical body, which within their Functions, Contribute and Participate in the Natural Physiological Process in the Removal of Cell Toxicity, from the Physical Body.*

"It then occurred to me that many an interior complaint suddenly disappeared, as soon as an eruption showed itself on the exterior. Could not, so I asked myself, such an eruption be brought about by artificial means?

In other words, could it not be possible by some means or other to help the Morbid Matters, concealed in the interior of the body, to break through, to entice them, out on the surface of the skin, and so relieve the Water-Cure of a good deal of its work? When the Evacuation of the Bowels is Irregular, in most cases the whole organism is not in order; not only the Stomach or some other particular part (other organs); and I am of the firm conviction, which a great

number of cases have always confirmed, that Water Is The Surest and Most Harmless Remedy to be found on the Earth. It helps by being applied Interiorly, and by being permitted to operate Exteriorly. One of the first questions which the doctor puts to the patient is: Are the Bowels Regular?

If this is so, one has the First Sign of Health; if they are irregular, it is the sign of the commencement of an illness, and if this evil is not remedied, the patient goes to meet an illness, sooner or later, perhaps an early death." - Msg Sebastian Kneipp, in "My Water-Cure, Tested for more than 35 years, and described for the Healing of Diseases and the Preservation of Health", 1891.

> ***"I have not translated words but ideas. And the ideas I have rendered fully and faithfully; on this head I challenge criticism."*** *- Dr Charles J. Hempel, MD in "The Chronic Diseases: Their Specific Nature and their Homeopathic Treatment", 1889.*

> ***"For whatsoever things were Written, Aforetime were Written for our Learning, that we through Patience, and Comfort of the Scriptures might Have Hope."*** *- Romans 15:4*

> ***"Three Factors Make Cancer Fatal:***
> ***1. Continuation of the cause.***
> ***2. Medical Trade efforts to cure (everyone knows that both Radium, and X-Rays are capable of causing cancer).***
> ***3. Fear, and mistaken belief in incurability.***
> ***Cancer is but one result of failure to live healthily: Psychological Turmoil, Wrong Thinking, Vitamin and Mineral Deficiency, and Toxic Accumulation, Are The Causes."*** *- Dr Ulric Williams, MD, Surgeon, in "Hints on Healthy Living", 1934.*

The Place of Food in Emunctology

> ***"What you Eat is going to impact your Immune System."*** *- Dr Aseem Malhotra, MD in "Sky News", March 2020.*

> ***"The connection with low-Vitamin diet is for the barlow and the proven Scurvy.***
> ***After all, it is striking that not all but only a certain number of children fall ill with the same diet. The lack of the Vitamin cannot therefore be the sole triggering cause, there must also be a weakness in the organism that is somehow justified, so that only through the interaction of both factors does the disease break out just as much as an infectious disease, in which the pathogen is also responsible alone does not mean illness.***

> ***Tobler also writes: "We ask to us, whether the organism itself has the ability to build up the vital substance, and whether perhaps the appropriate food only creates the necessary preconditions for its production."*** *- in "Diseases; rickets", Advances in Internal Medicine and Pediatrics, 1922.*
>
> *"Dr John Haddon writes, with reference to Dr Cameron's contribution to the The British Medical Journal of 9 June 1917,* ***on Status Lymphaticus, to suggest that he should, in the treatment of such cases, confine them to one food at a time so as to be sure of its action one way or another. We know, Dr Haddon continues, more now about the physiological action of drugs than we do about that of foods. I find that each food. has not only an action on the several Emunctories, but gives rise to some special symptom. Dr Cameron blames carbohydrates generally, but I find that the several cereals have different effects on the Emunctories; Wheat causes not only intestinal, but renal stasis, and throws a strain on the skin and lungs. I also find that each cereal seems to have some injurious item, and that a mixture of cereals is especially bad, the combined bad item having more effect."*** *- in "Status Lymphaticus", The British Medical Journal, 4 August 1917.*

Dietary Considerations in Disease

"The Dietetic Treatment which has for many years been known as the Gerson Diet, was developed first to relieve my own severe Migraine condition. Then it was successfully applied to patients with allergic conditions such as Asthma as well as Diseases of the Intestinal Tract, and the Liver Pancreas apparatus. By chance a patient with Lupus vulgaris (skin tuberculosis) was cured following the use of the Diet. After this success the Dietetic Treatment was used in all other kinds of Tuberculosis-bones, kidneys, eyes, lungs, and so forth.

It was Highly Favourable In Many Other Chronic Diseases, such as:

1. **Arthritis.**
2. **Heart Diseases.**
3. **Chronic Sinusitis.**
4. **Chronic Ulcers.**
5. **Colitis.**
6. **High Blood Pressure.**
7. **Psoriasis.**
8. **Sclerosis Multiplex.**
9. **And so on.**

The Most Striking Results Were Seen in the Restoration of various kinds of Liver and Gall Bladder Diseases, which could not be influenced by other methods up to the present.

The Great Number of Chronic Diseases which Responded to the Dietetic Treatment, showed clearly that the human body lost part of its resistance and healing power, as he left the way of natural nutrition for generations. The Fundamental Damage Starts with the use of artificial fertilizer for vegetables and fruits as well as for fodder.

Thus the chemically transformed vegetarian and meat nourishment, increasing through generations, transforms the organs and functions of the human body in the wrong direction. Another basic defect lies in the waste of excrements of the cities. Instead of returning the natural manure to the fruit-bearing soil, it is led into the rivers, killing underwater life. The natural cycle is interrupted and mankind has to suffer dearly for the violation. Life in forest and wilderness should teach us the lesson. But we can regain the lost defence and healing power if we return as close as possible to the laws of nature as they are created. Highly concentrated for speedy reaction, they are laid down in the dietetic treatment. The treatment is ineffective in cases with less than 10% lymphocytes in the differential blood count when the phosphorous cannot be brought back into the red blood cells and other tissues; it is also ineffective in patients with advanced liver damage, and, of course, in those who are in extremis. My experience leads me to believe that the Liver is the Centre of the restoration process in those patients who improve strikingly.

If the liver is too far destroyed, then the treatment cannot be effective.

It is Condensed in 3 Surpassing Components:

1. The Elimination of Toxins and Poisons and returning of the displaced "extracellular" Na-group, connected with toxins, poisons, edema, destructive Inflammation, from the tissues, tumors, and organs where it does not belong, into the serum and tissues where it belongs gallbladder with bile ducts, connective tissue, thyroid, stomach mucosa, kidney medulla, tumors, and so on.

2. Bringing back the lost "intracellular" K-group combined with vitamins, enzymes, ferments, sugar, and so forth, into the tissues and organs where it belongs-liver, muscles, heart, brain, kidney cortex, on this basis, iodine, ineffective before, is made effective, continuously added in new amounts.

3. Restoring the differentiation, tonus, tension, oxidation, by activated iodine, where there were before growing tumors and metatases with differentiation, loss of tension, oxidation, loss of resistance and healing power." - Dr Max Gerson, MD, in "Cancer Research: Hearings", on S. 1875, Bill to Mobilize in the World's Outstanding Experts, and Coordinate and Utilize Their Services in a Supreme Endeavor to Discover Means of Curing and Preventing Cancer, U.S. Congress, July 1946.

The Nature of Inflammation

"There is no abnormal condition of the human system or of its various parts, which calls for the physician's or surgeon's aid so frequently as a condition universally designated inflammation.

Every organ, every tissue, from centre to circumference, inclusive, inside or outside, this process is liable to invade with grades of danger, ranging from slightly noticed inconvenience and discomfort, to immediately threatening death. Observing the deranged and diminished action of the secretory system, direct their whole line of treatment to increase the secretions, and obtaining some satisfactory result from that treatment, are ready to assert and maintain that the origin and essence of the disease is chargeable to diminished action of the secretory system, and thus show us quite a plausible philosophy.

The same, or similar conclusions, are reached by those who direct their attention to the altered conditions of the Emunctory System." - in "The Nature of Inflammation", 4 December 1895.

> ***"Emunctories describes organ or ducts with the physiological function that involves draining or removing waste materials from the body.***
>
> ***The Emunctories function to eliminate both the waste produced by the thirty thousand billion body cells and the exogenous toxins absorbed from the environment either deliberately or involuntarily.***
>
> ***Kuhne, in "Nature Cure", 1922, stated that "disease is a unit" that it consists in the accumulation of waste and morbid matter in the system.***
>
> ***Restated in modern scientific idiom, Kuhne postulated that underlying all disease is the accumulation of both toxins, and abnormal organic material (which include cells and cellular components).***
>
> ***The corollary of this postulate, which forms the basis of nature cure, is that the elimination of toxins and abnormal organic material is an important part of the healing process."*** *- in "Integrative Medicine", June 2019.*

Causa Morbi

"Health may be said to be a balance of Vital Power, controlling and harmonizing Structure and Function.

A Cause of Disorder of Health

When a causa morbi is present in the organism, any single organ or system of organs may suffer; it may be the nervous system or the vascular system, the respiratory, the digestive, or the Emunctory System; or an individual organ, for example, the liver, the kidney, or the skin.

The organ which shall be so attacked by the causa morbi will be determined by a variety of circumstances and conditions; e.g. hereditity, diathesis (predisposition, state of the body), season of the year, habits of life, age, etc..

Therefore the same causa morbi may, in 20 individuals, give rise to 20 different diseases.

Sometimes the same causa morbi will be the occasion of several diseases in the same individual; say, for instance:

1. **Disordered function of the Liver**
2. **Diarrhoea**
3. **Catarrh (build-up of mucus)**
4. **Rheumatism**
5. **Eczema**

Sometimes the same causa morbi may operate in succession on several organs; thus, disordered function of the digestive organs may precede, and then may follow, rheumatism, and after rheumatism, eczema; we see such cases by no means infrequently in daily life.

But, it will happen also, that the order of succession of diseases may be reversed." - Sir Erasmus Witson, FRS, in "On Morphoea or Vitiligo", Journal of Cutaneous Medicine and Diseases of the Skin, 1868.

5 - The Advise on the Adequate Vitamin and Mineral Supplementation to the Diet

The Emunctologist must advise on the adequate Vitamin and Mineral Supplementation to the Diet.

Minerals

"Before there were vitamins, before there was food, before there was life, there were minerals. Minerals are the real stuff we are made of, and they act as building stones to all cells in our bodies.

Calcium

Calcium Is A Most Valuable Mineral, and is of Great Benefit for All, and Even More so, to those Recovering from Illness. The bones of the body are mainly composed of Calcium, and this element gives tone to the muscles, while lack of it leads to decay in the bones and teeth.

The human body contains more calcium than any other mineral, over 90% of which is deposited in bones and teeth to keep them strong and hard.

The remainder is essential for healthy blood for a regular heartbeat and the health of the nervous system.

Calcium Deficiency is generally characterized by:

Muscle Cramps, Numbness and Tingling in Arms and Legs.

For optimal Calcium absorption, you need adequate levels of Vitamin D, and a healthy Digestive System to transport Calcium from food into the bloodstream. Magnesium plays a crucial role by helping to convert Vitamin D into its active form, calcitriol, which is essential for calcium absorption Thus Calcium Cannot Be Absorbed if Magnesium, and Vitamin D are Missing.

Iodine

Is required for the proper functioning of the thyroid gland. Iodine plays a major role in regulating the production of energy and stimulates the rate of metabolism, Iodine deficiencies lead to health problems.

Magnesium

Is a powerful agent in the elimination of waste matter from the system. Magnesium deficiencies are quite common with symptoms being nervousness, muscle twitches, confusion and the formation of calcium deposits. Due to its importance within the central nervous system. In the Muscular System, Magnesium has a reputation as a calming, relaxing substance.

Sodium - Sea Salt

Is a necessary constituent of the gastric juices, and is found in all fluids in the body. It is valuable for eliminating acids from the system in general. Sodium keeps other minerals soluble in blood and is involved in muscle expansion and contraction.

Water

Water is an Important Component of the Cells and Tissues, it keeps tissues soft and pliable and acts as a solvent of gases, foods, etc., permitting diffusion of these substances in the body. It is the medium of transport for food absorbed from the alimentary canal. Absorbed Food is carried from the Alimentary Canal, in the Watery Blood Plasma To All Parts of the Body. Water enables Glands to manufacture their particular Secretions, and assists in regulation body temperature. Harmful Waste is carried in Solution to Excretory Organs. The Body Consists of 75% water. Water Is The Most Important Food Intake. Too little attention is placed on this fact. Fluid is needed for assimilation and transmutation of Minerals & Vitamins. Foods and Oxygen cannot be used without Fluids.

> ***"People in their 30's and 40's, are busy building physical deficiencies which are bound to result in serious illnesses later. There is evidence now to indicate that poor eating habits might be responsible for many more types of illness than science ever imagined. Even infertility, mental retardation, heart disease and cancer may be directly related to poor nutrition."*** *- Dr E. Cheraskin, DM, DMD, University of Alabama Dental School*

Mental and Spiritual Neglect Can Cause Illness

Mental Attitude Is Your Responsibility. Neglect in the mental realm can cause trouble in your physical body. Your Spiritual Responsibility Do Not Neglect to Pray, to Meditate, to Contemplate. Neglect in Spiritual Ways: Have you prayed? Did you protect your aura? Every culture, every civilization has had or has a method of protecting the human aura from foreign, undesirable, influences. Honest Prayer makes a Blue Light. A Blue Light is a power, an energy which is of creative nature. Bless your food and the blue light of your blessing will make your food a healing food, bless your water and it will become a healing water. Bless your child and pray over your beloved ones and the blue light will heal the fluid which will reach the very cell, and the cell will obey the light." - in "God Helps Those That Help Themselves", 1984.

Any penetrating light, that of the dry heat, or that, that acts the quickest with the blood stream, as is seen, this is the effect of light; whatever nature that may be applied to a body: All bacilli, or all germs are afraid, of light, or light is destructive to all. Some, accumulate in heat, that is not penetrating.

Hence the variation in the quartz light, the ultra-violet light, the blue light, the red light, each one taking out that, that filters through the system.

Hence the most penetrating without being destructive to the tissue proper.

The Natural Time for the Regeneration of All the Body Tissues

1. It takes 48 Hours to build New Skin in the palm of the hand.

2. The Brain takes weeks to regenerate.

3. Every 90 days the Blood Cells renew.

4. If the correct protocol is adhered to and followed, Hair will re-grow within 9 months.

5. Several Months to Renew: Stomach Walls, Liver Tissue, and Kidneys tissue. The repair process starts immediately after injury, and significant regeneration has been observed between 3 to 4 weeks, after injury on the liver.

6. Every 3 years the Soft Tissues (Organs) Renew.

7. Every 7 years the Hard Tissue (Bones) Renew.

The Brain Regenerates

Researchers at Princeton University in 1999 found that New Neurons were continually being added to the Brain. The Neurons, were added to the cerebral cortex of the brain which is the most complex part of the Brain. The cerebral cortex is responsible for higher level decision making and learning. The formation of new nerve cells, a process called neurogenesis.

When Brain Cells are Injured: They Revert to an Embryonic State

> ***"In the early regenerative (day-14) state, transcriptional networks related to protein translation, energy production and mitochondrial function were activated, suggesting increased cellular activity to support axonal growth. In a 2 week time frame, classical neurodevelopmental events occur that are associated with successful regeneration."*** *- in "Injured adult neurons regress to an embryonic transcriptional growth state", Nature, 15 April 2020.*

Vitamin D, Magnesium, Calcium Carbonate, Iodine and (Sea) Salt

Vitamin D, Magnesium, Calcium Carbonate, Iodine and (Sea) Salt: These 5 substances represent a combination of major minerals, trace elements, and vitamins that interact heavily within the human body for bone health, metabolic regulation, and fluid balance.

These Substances Connect and Interact

The Bone-Building Trio

1. Vitamin D: Essential for absorbing Calcium in the gut; without it, the body cannot effectively use the Calcium
2. Calcium Carbonate: A form of Calcium used to build and maintain bone structure. It requires stomach acid to dissolve.
3. Magnesium: Converts Vitamin D into its active form so it can be used. It also balances Calcium.

The Thyroid and Fluid Duo

1. Iodine: A trace mineral strictly required by the Thyroid Gland to produce Metabolic Hormones.
2. Salt (Sea Salt): Keeps your fluids balanced and helps nerves transmit signals.

These 5 elements are absolutely fundamental to sustaining human life, regulating cellular metabolism, and maintaining structural integrity. Together, they form a biological network where the deficit or excess of one directly disrupts the utility of the others.

The Interdependent Action

1. Vitamin D and Magnesium: Vitamin D cannot function without magnesium. Every single enzyme that metabolises vitamin D in the liver and kidneys requires magnesium as a cofactor. If high doses of vitamin D, are taken, while depleted in magnesium, the body will draw magnesium out of the storage sites (like muscles and bones), worsening a hidden magnesium deficiency.
2. Calcium Carbonate: It serves as the raw material for your skeletal architecture and cellular signaling. However, Calcium relies entirely on vitamin D for intestinal

absorption. Without the active form of vitamin D (which requires magnesium), calcium carbonate cannot be effectively absorbed. Instead, it risk calcifying soft tissues, arteries, or forming kidney stones.

3. Salt (Sea Salt) and Iodine: These two are biologically intertwined. The thyroid gland requires iodine to manufacture thyroxine (T_4) and triiodothyronine (T_3), which dictate the basal metabolic rate of every cell. Iodine deficiency causes severe developmental and thyroid diseases. Meanwhile, the sodium in salt regulates extracellular fluid volume, osmotic pressure, and the electrochemical gradients required for nerve transmission.

Balance And Equilibrium Is the Key To Health

1. Beware: Of too much is as bad as too little, the Equilibrium is the Key to Health.
2. The Renal Flush: High dietary sodium (salt) intake directly increases urinary calcium excretion. The kidneys clear sodium and calcium using the same transport mechanisms; thus, an excess of salt forces the body to dump calcium, accelerating bone loss.
3. The Receptor Competition: Calcium and magnesium utilize the same transport channels in the gastrointestinal tract. Flooding the gut with a high dose of calcium carbonate will competitively inhibit the absorption of magnesium.

Vitamin D and Calcium Aid in Lung Cancer

A large systematic analysis in "Anti-Tumor Effect of Vitamin D Combined with Calcium on Lung Cancer", Nutrition and Cancer, 2021, evaluated over 58,600 lung cancer cases and found that the combination of Vitamin D, and Calcium, has an anti-tumor effect on lung cancer, significantly reduced cancer incidence. Vitamin D aids in Calcium absorption, regulates cell growth, and modulates immune function, while Calcium helps maintain healthy cellular processes.

Vitamin D, Magnesium and Calcium Carbonate Inadequate Intake are Contributing Risk Factors for Various Types of Cancer

> *"A low Vitamin D status and inadequate Calcium intake are contributing risk factors for various types of cancer. Ecological studies using Solar Ultraviolet-B exposure as an index*

of Vitamin D3 Photoproduction in the skin found a highly significant inverse association between Ultraviolet-B and mortality in 15 types of cancer. Of these, colon, rectal, breast, gastric, endometrial, renal and ovarian cancer exhibit a significant inverse relationship between incidence and oral intake of calcium. In addition, lung and endometrial cancer as well as multiple myeloma are considered Calcium and Vitamin D sensitive. Vitamin D and Calcium insufficiency has been implicated in the pathogenesis of the aforementioned types of cancer. A nutritional calcium deficit and a compromised Vitamin D status are risk factors for multiple chronic diseases, including various types of malignancy. A strong association between a low Vitamin D status and cancer incidence or mortality has been reported for colon, rectal, breast, prostate and ovarian cancer. In addition, Vitamin D insufficiency apparently contributes to the pathogenesis of gastric, lung, esophageal, pancreatic, renal and endometrial cancer, as well as non-Hodgkin's lymphoma. There is evidence that poor calcium nutrition is a significant risk factor for total cancer incidence, and, in particular, for colorectal, breast and renal cancer. Low calcium intake may also contribute to the development of gastric, pancreatic and ovarian cancer, and to some extent of endometrial lung and prostate cancer, as well as multiple myeloma. High intake of Vitamin D together with Calcium is relevant not only for cancer prevention and, as is well known, for osteoporosis therapy, but has benefits for many other calcium and Vitamin D insufficiency-related pathologies, including infectious, chronic inflammatory and autoimmune diseases as well as incipient and end-stage cardiovascular disorders." - in "Calcium, Vitamin D and Cancer", Anticancer Research September, 2009.

Vitamin D, Magnesium and Calcium Carbonate Deficits Predispose for Multiple Chronic Conditions

"There is evidence from both observational studies and clinical trials that Calcium Malnutrition and Hypovitaminosis D are predisposing conditions for various common chronic diseases. In addition to skeletal disorders, Calcium and Vitamin D deficits increase the risk of malignancies, particularly of colon, breast and prostate gland, of chronic inflammatory and autoimmune diseases, as well as of metabolic disorders (metabolic syndrome, hypertension). Calcium Malnutrition eventually causes a decrease in Calcium concentration in extracellular fluid compartments, resulting in organ-specific modulation of calcium-sensing receptor activity. Hence, attenuation of signal transduction from the ligand-activated Vitamin D receptor and Calcium-sensing receptor seems to be the prime mechanism by which Calcium and Vitamin D insufficiencies cause perturbation of cellular functions in bone, kidney, intestine, mammary and prostate glands, endocrine pancreas, vascular endothelium, and, importantly, in the immune system. Wide range of

> *diseases associated with deficits in Calcium and Vitamin D in combination with the high prevalence of these conditions." - in "Vitamin D and Calcium Deficits predispose for Multiple chronic diseases", European Journal of Clinical Investigation, May 2005.*

6 - The Advise on the Need for Osteopathic Manipulations

The Emunctologist must then advise on the need for correct Osteopathic Manipulations: First And Foremost; to improve Lymphatic Circulation, and Secondly the Blood Circulation. These Osteopathic Manipulations are given, as well for the benefit of improving stimulation of the nerve supply, these should be Neuropathically given, with the final aim of restoring the balance between the Sympathetic, and the Cerebrospinal System (Central Nervous System; which consists of the Brain and Spinal Cord). The Sympathetic System lies parallel with the Cerebrospinal, making direct connections in Centers along the Cerebrospinal System. For the force that vivifies the physical body, and controls the Nervous System of the body Is The Soul of each individual. It is this Life Force (Electrical in Essence) that controls the physical body via the Nervous System. The Emunctologist should be aware, must be aware that the Physical Body has Nerve Centers, particularly when identifying pathological factors requiring for its resolution, Manual Therapy such as: Osteopathy, Chiropractic, Neuropathy, Massage); or Electrotherapy with the correct and specific attachments from appliances to these very same centres. The concept of ganglia as centres is the basis for the sympathetic nervous system with its own primary centre (the Solar Plexus Brain or Abdominal Brain).

> ***"The priority of the sympathetic nerves, over the cerebro-spinal is evident and signifies their import in the continuance of the vital forces of life. The Ganglia are Little Brains, for they all have the elements of the cranial cerebrum; nerve cells and processes. In short every nerve cell is a unit in itself. It is an isolated anatomic unit, a neuron, a brain and a reorganizing center. The essential of the cell is the nucleus because it has the power of nutrition, hence reproduction. Hence each ganglion is a little brain, a reorganizing center. The ganglia, composed of nerve cells, are little brains, they are reorganizing centers, receiving sensations and sending out motion. Thus, the ganglia of the sympathetic nerve are little brains; i. e., they receive sensation, emit motion, and control secretion. They are trophic centers, and possess vaso-motor power. They are centers for reflex action, and are endowed with a peculiar quality called rhythm. The abdominal and pelvic brains and the ganglionic plexuses are simply***

> ***large brains or aggregations of nerve cells."*** *- Dr Byron Robinson, MD, in "The Abdominal Brain and Automatic Visceral Ganglia", 1907.*

The Nerves that originate from the Cerebrospinal Axis, or Peripheral (Sympathetic Ganglia), have their Own Distinct Role. Thus, the Emunctologist will find that all organs are connected by Bidirectional Axis. The human body does not operate as a collection of isolated parts. Instead; it functions as a Network of Bidirectional Axes; where Every Organ constantly "talks" to and "listens" to every other organ. These Axis are at the centres where the nerves connect. Two of the most important Nerve Centres, are the Pneumogastric, and Hypogastric. Known the Pineal Nerve has also its systemic influence. Thus the Emunctologist should known that the lack of coordination; leads necessarily to incoordination between the Cerebrospinal Nervous System, and the Sympathetic Nervous System (Vegetative Nerve System), this incoordination is a Major Pathophysiological Factor in Several Health Conditions. [Please see Chapters 11 and 35]

The Nerve Force and Anesthesia

"Nerve Pulse Propagation and Anesthesia: Both Nerve Activity and the Action of Anesthetics can be understood on the basis of simple physical laws. It was found experimentally that biological membranes melt from a solid state to a liquid state just below physiological temperature. Such melting processes have a profound influence on the physical properties of cell membranes. They make it possible for mechanical pulses (solitons) to travel along nerve axons. In these pulses, a region of solid phase travels in the liquid nerve membrane. These pulses display many properties associated with the action potential in nerves. Both general and local anesthetics lower melting temperatures of membranes. Thus, they make it more difficult to excite the nerve membrane. Since hydrostatic pressure increases melting temperatures, it counteracts anesthesia. This theory has the virtue of providing a simple explanation of the famous Meyer-Overton correlation, which states that the effectiveness of an anesthetic is proportional to its solubility in the lipid membranes of cells. We offer evidence that this concept if also applicable to local anesthesia. The miracle of the appropriateness of the language of mathematics for the formulation of the laws of physics is a wonderful gift. The laws of physics, expressed in a mathematical language, are universal. They apply to anything ranging from small sub-atomic particles to very large galaxies. Ion currents can

flow along the nerve or through the nerve membrane. Hodgkin and Huxley proposed that sodium and potassium currents pass through ion-specific channel proteins called Na-channels and K-channels, respectively. The electrical resistance of these channels is assumed to be a function of voltage, and this property leads to the possibility that a localized pulse of electrical activity can travel along the nerve axon. One can measure small electrical currents through the cell membrane. These currents are not constant, but rather display distinct on-off characteristics that have been associated with the opening and closing of ion channel proteins." - in "Nerves and Anesthesia: A physics perspective on medicine", 8 September 2014.

> ***"Reactions to agents employed in regional Anesthesia are quite frequent. Seevers has stated that local Anesthetics cause more deaths than does any other class of commonly used drugs. Many are mild and self-limited but fatalities do occur. Most frequently the mild reactions are ignored or considered inconsequential and this attitude is foolhardy. The mild reactions should be considered as warning signals, as evidence of an untoward response that may be the precursor of a more severe type reaction which can jeopardize the patient's life."*** *- in "Fundamentals of Nerve Blocking", London, 1960.*

7 -The Advise on the Need for Chiropractic Adjustments

The Emunctologist must advise on the need for correct Chiropractic Adjustments, these to remove any Subluxation (displacement of bone from its normal neutral position).

> ***"One or more vertebrae of the spine may or may not go out of place. They might give way very little, and if they do, they are likely to produce serious complications and even death, if not properly adjusted, many diseases are related to the spine."*** *- Hippocrates, Greek Physician established School of Healing, Island of Cos.*

> ***"The reason why Manipulation, especially Spinal, lies under a cloud today, is not that it is ineffective, everyone knows of cases where it was dramatically successful; but that it is carried out by people of whom doctors disapprove."*** *- Dr James Cyriax, MD, in "General Practitioner"*

Keep a well-rounded, a well balanced life; in Physical Exercise, in Physical Rest, and in Mental Application.

Chiropractic and The Nervous System

"The Landmark Discovery: On 18 September 1895, D. D. Palmer, talked to his building maintenance man, Harvey Lillard, and found that he had to shout to him in order to be heard. He inquired of Harvey about the cause of his deafness.

Harvey explained that 17 years previously, when he was exerting himself in a bent over, and cramped position, he felt a pain in his upper back; after which he lost his hearing. Palmer examined him, and found a painful, prominent vertebra in Harvey's upper back which appeared out of alignment.

On pressing it, Harvey exclaimed:

> ***"Yes, This was the same Bone that Hurt when he Lost his Hearing."***

Dr Paul Bechgaard, MD, Professor of Internal Medicine of the University of Aarhus, Denmark, described his clinical experience using Spinal Adjustments on patients who suffered Deafness, in "Nordisk Medicin", 6 June 1963.

Described a case in which a 54 year old **man suffering from lumbago, and a long-standing Hearing Defect (7 years) was given Spinal Adjustment.**

A marked improvement in his hearing ability resulted and it was found that the blood supply to the "organ of Corti" in the ear had been impaired by irritation of nerves leading from the upper spine.

The ear specialist by whom the patient had been treated previously and unsuccessfully, examined the patient and verified that the patient's hearing had been restored. Dr Bechgaard, also reported good results in 6 similar cases, treated in the following year, by Spinal Adjustment. It was his opinion, that **the cause of the Hearing Defect was the impaired blood supply to the organ of Corti, and that this Impairment of Circulation was caused by an Irritation of the Sympathetic Nerves leading from the upper thoracic spine.**

> ***"The patient had no symptoms referable to the head or neck until he had been injured when he gradually developed a Meniere's syndrome consisting of unilateral deafness, tinnitus and vertigo so severe that he almost always vomited, and the only relief he obtained was going to bed. At first he was treated by manipulation of his stiffened neck joints and although this did not help, the relief was transient and very far from complete. When the thoracic spine was examined, the lesion at T4, T5 was found and manipulative treatment to this joint resulted in dramatic and lasting relief of all symptoms referred to, including the deafness. It may be that the anatomist's***

> ***description of the sympathetic supply to the head and neck is incomplete or that there are some unknown factors."*** *- Dr John Bourdillon, FRCS, in "Spinal Manipulation", 1982.*

He is the past president of the North American Academy of Manipulative Medicine, an English orthopedic surgeon. Doctor Ussher **found a direct connection between diseases of the internal organs of the body and spinal distortions.** He confined his Treatment of the patients, **to Spinal Manipulation to correct the spinal distortions and misalignments, and was able to correct many of the disorders of the internal organs in over 400 patients.**

He reported as having Treated, and Cured such Ailments as:

1. **Occipital and Frontal Neuralgia.**
2. **Bronchial Asthma.**
3. **Cardiac arrhythmias and changes in cardiac circulation.**
4. **Spasm of the cardiac sphincter of the esophagus.**
5. **Pylorospasm of the intestine.**
6. **Functional disturbances diagnosed as chronic Appendicitis.**
7. **Intestinal colic.**
8. **Colitis.**
9. **Spasm of the sigmoid and rectum causing Constipation;**
10. **Urethral Spasm.**
11. **Urinary frequency and urgency.**
12. **Etc...**

Doctor Henry Winsor, MD dissected a total of 50 human cadavers to see if there was any relationship between any diseased organs discovered on autopsy, and the vertebrae associated with the nerves that went to the organs.

> ***"The object of these necropsies was to determine whether any connection existed between minor curvatures of the spine on one hand, and diseased organs on the other; or whether the two are entirely independent of each other. All curvatures and deformities of the spine were rigid, apparently of long duration, irreducible by ordinary manual force. Extension, counter-extension, rotation, even strong lateral movements failed to move them to change positions. [This was because of arthritic changes in the vertebrae]. The organs were in many instances affected by acute disease, while the deformed vertebrae proved that the curvatures preceded the organic disease, though theoretically, reflexes through muscle spasm may reverse the order of***

> ***precedence."*** *- Dr Henry Winsor, MD, in "The Evidences of the Association, in Dissected Cadavers, of Visceral Disease with Vertebral Deformities of the Same Sympathetic Segments", Medical Times, 1921.*

Upon opening up the bodies of those persons who had died of Heart Disease, and had traced the nerve from the heart back to the spine, he found in every case (but 2), that the cause of death, was also found in the area of the spine that was most misaligned and damaged by disease. His report showed that there was nearly 100% correlation between minor curvatures of the spine and disease of the internal organs." - in **"Are Epidemics and Vaccinations Billion Dollar Scams"**, 2010.

> ***"Once the varying anatomic features were recognized, it became apparent that the position of the organs in the body was of importance for their function. This led to that which is now called body mechanics or the function of all parts of the human body, bones, joints, muscles, viscera and nerves. This naturally deals largely with the general physiology of the body. This study has shown that many of the other chronic diseases are probably part of the disturbances which at times result in arthritis or the progressive paralyses but at other times may result in diabetes, the chronic blood diseases, various skin lesions or cardiorenal diseases. With the general increase in the common chronic diseases, it would seem possible that a study of anatomy, body mechanics and physiology in these cases might be of help."*** *- Dr Joel Ernest Goldthwait, MD, in "Essentials of Body Mechanics in Health and Disease", 1945.*

8 - There is a Mind, even a Soul, behind the face of each Individual

> ***"For As The Body Without The Spirit is Dead."*** *- James 2:26*

The Emunctologist should remember that there is a Mind, even a Soul, behind the face of each Individual. Man, is not meant To Live Neither in Isolation, nor Without a Purpose, thus advise accordingly.

Thus, to treat many conditions, one must necessarily understand, and have a good grasp of the mechanisms, in the Body-Soul connection.

> ***"Statistics prove that married persons on average, are longer lived than single ones, and my own observation has convinced me that they are more exempt from disease."*** *- Dr Frederick Hollick, MD, in "Facts for the feeble", 1885.*

"A knowledge of the whole human being sufficiently thorough to permit an intelligent interpretation of all its possible conditions of health and disease, as well as the proper course to pursue when disorders arise, is so absolutely essential, as a safeguard against every variety of delusion and imposition as to be a necessary part of everyone's education.

A large part of our miseries, agonies and unhappiness generally comes from misunderstandings, which are mainly the result of ignorance. Manual Therapeutics, has achieved a widespread appreciation of its own merits, and Suggestive Therapeutics has grown to such substantial proportions as to clamour for universal recognition, while the old, time honoured temple of medicine has industriously striven to meet the ever-changing and increasing wants of humanity to the best of its ability.

Each means of cure has its appropriate field of operation, and all possible remedial measures that have been found helpful in the healing of the sick are sorely needed in the great campaign of humanity against disease and premature decay. There should be no rivalry between the various methods of cure, but, on the contrary, they should enjoy mutual appreciation and helpfulness.

This desirable state of affairs can be attained only when the nature of man, both Physical and Spiritual, is better understood. So long as one set of healers has a care merely for the Physical Part of the human being, ignoring, as far as possible, all consideration of his Spiritual Nature, and necessities, and another set refuses to recognize the claims of man's material part, but hopes to rescue humanity from its aches and pains by purely psychological processes, sick humanity can have little hope of perfect and permanent recovery.

But when the dual nature of man, becomes universally recognized and the fact that, so far as his present existence is concerned, he is not a mere; Body nor a mere Soul, but Both, and that each acts and reacts, upon the other in both health and disease, becomes universally appreciated, Practical Medicine, Manual Therapeutics and Suggestive Therapeutics can sit down in friendly counsel with some hope of successfully solving the great problem of humanity's emancipation from the thralldom of Sickness, and Suffering.

The study of Anatomy, as it is now carried on by any means complete, for it ignores all consideration of the 2 Spiritual Forms:

1. **The Conscious, and the**
2. **Sub-Conscious shapes, without which what remains is but a corpse — a man, indeed, with the man left out.**

The existence of Man's Spiritual Parts as essential elements in all that concerns his every possible condition." - Dr E. H. Pratt, MD, in "The Composite Man", 1901.

"When we consider the individual (and we should be eternally grateful to Hahnemann that he always dealt with the sick individuals and not with the diseases), we find 2 quite different parts; the Head, and the Metabolic parts. They stand opposite one another even in the it anatomical structure, and one part has a counteraction on the other if a worrying excitable person develops a duodenal ulcer, etc. This interaction should be held in mind." *- Dr Lees, MD, in* ***"The Role of Bowel Flora in Chronic Disease"****, The British Homeopathic Journal, January 1949.*

"Man has a Soul which is his real self; a Divine, Mighty Being, a Son of the Creator of all things, of which the Body, although the earthly temple of that Soul, is but the minutest reflection: that our Soul, our Divinity Who resides in and around us, lays down for us our lives as He wishes them to be ordered and, so far as we will allow, ever guides, protects and encourages us, watchful and beneficent to lead us always for our utmost advantage: that He, our Higher Self, being a spark of the Almighty, is thereby invincible and immortal. We must realise that the short passage on this earth, which we know as life, is but a moment in the course of our evolution, we must realise that the short passage on this earth, which we know as life, is but a moment in the course of our evolution, as one day at school is to a life. The next Great Principle Is The Understanding of the Unity of All Things: that the Creator of All Things Is Love, and that everything of which we are conscious is in all its infinite number of forms A Manifestation of That Love." *- Dr Edward Bach MD, in "Heal Thyself: An Explanation of the Real Cause and Cure of Disease", 1931.*

"They that be whole need not a physician, but they that are sick." *- Matthew 9:12*
"To Understand Disease; its object, its nature, and its cure: we must in part comprehend the reason of our being and the laws of our Creator in relation to us.
It Is Essential to Realise that Man has 2 Aspects: 1. Spiritual and 2. Physical; and that of these 2, the physical is infinitely the less important. Under the guidance of our Spiritual Self, our Immortal Life, Man is born to gain knowledge and experience; and to perfect himself as a physical being. The physical body alone, without communion with the Spiritual, is as an Empty Shell, a cork upon the waters, but When There Is Union, Life Is A Joy, an adventure of absorbing interest; a journey yielding Happiness, Health and Knowledge. Our evolution began as a new born babe, without knowledge, and with the whole interest self-centred. Desires being limited to comfort,

> ***food and warmth. Then as we advance comes the desire for power, and so for a time, we continue to be self-centred, desiring only our own gain, and worldly ambitions." -*** *Dr Edward Bach, MD, in* **"Some Fundamental Considerations of Disease & Cure"**, *Homeopathic World, 1930.*

The Emunctologist should be aware that: In the Physical Body, some affections or conditions do arise, partially, from a karmic relationship.

The Vital and Immortal Principle

"Every kindly smile, every kindly thought and action; every deed done for love or sympathy or compassion of others proves that there is something greater within us, than that we see. That we carry a Spark of the Divine, that within us resides a Vital and Immortal Principle. And the more that Spark of Divinity shines within us, the more our lives radiate Its sympathy, Its compassion: and Its love. The more we are beloved by our fellow-men and fingers are pointed at us and the words are said: "There goes a God-like man". The amount of peace, of happiness, of joy, of health and of well-being that comes into our lives depends also on the amount of which the Divine Spark can enter and illuminate our existence. From time immemorial, man has looked at 2 great sources for Healing. The mind is the most sensitive part of our bodies, and hence the best guide to tell us what remedy is required. To his Maker, and to the Herbs of the field, which his Maker has placed for the relief of those who suffer. Yet one Truth has mostly been forgotten. That those Herbs of the field placed for Healing, by comforting, by soothing, by relieving our cares, our anxieties, bring us nearer to the Divinity within. And it is that increase of the Divinity within which heals us. It is a very wonderful thought, but **it is absolutely true, that certain Herbs, by bringing us solace, bring us closer to our Divinity: and this is shown again and again in that the sick not only recover from their malady, but in so doing, peace, hope, joy, sympathy and compassion enter into their lives; or if these qualities had been there before, become much increased.**

Thus we can truly say that certain Herbs have been placed for us by Divine Means, and the help which they give to us, not only heals our bodies, but brings into our lives, our characters, attributes of our Divinity.

It is as though in this vast civilisation of today, a civilisation of great stress and strain, the turmoil has been such that **we have become too far parted from the true Source of Healing, Our Divinity.**

Yet our Maker, knowing these things, took compassion upon us, and in His

Mercy provided a substitute means to heal our infirmities until when time or circumstance shall restore the genuine and direct. It is certain that **it is increased harmony between the Greater Self within, and the body without which has affected the cure. Herbs remove such and by so doing not only close the door to the entrance of disease, but make our lives happier, more joyous and more useful,** and what greater is there amongst all the Noble Arts than that of Healing, and what more befitting to the Brotherhood of Man than, like some of the Orders of Old, to carry ease to those in pain; solace to those in trial or distress; and comfort and hope to all those afflicted. **And these Remedies place in the hands of everyone the power to do these things. Not of their own power, but of the Power vested by the Great Creator in His Healing Herbs."** - Dr Edward Bach, MD, in "Wallingford Lecture", 1936.

He Is The Way

It is the will or the choice to apply self in relationship to the influences of the divine nature in the experience that makes for the growth, the development.

For ever the purpose of the entrance into materiality is to manifest the love of the Father as it may become a material application to the children of men; or the whole purpose may be included in these words:

> ***"As ye do it unto these, thy brethren, ye do it unto me."***

Hence the purposes in an experience are for the development of those forces and influences as to make or cause the whole of the entity's being, soul-body, soul-mind; to become more God-like, Christ-like.

For we each are not aliens but sons and daughters of the Father, and we should manifest ourselves in such measures as to be worthy of same - even as has been shown in Him, Jesus the man, Jesus the Christ; by the activities, by that meted to the world. Though the world rejected Him oft, He gave all.

His activities then are ensamples. Hence He is the way. And these the individual soul must manifest. For the high mental forces, if they are ever tempered with spiritual constructiveness; become as the means for not only giving of self in service in such a manner, but by the very application grow more and more in that consciousness of the self and soul being unfolded to the awareness of the divine within. Service, then, is that to which must arise as a key to the every mental, material and spiritual accomplishment.

Greater understanding and comprehension may come if those tenets of Him Who Is the Light, The Hope, The Way, are sought and applied. Keep in that Light, in Every way, that there may come the closer walks with Him, the closer concepts of spiritual understanding and application in the dealings with thy fellow man.

Keep thy heart and mind in the love of the Christ-Consciousness.

This will bring the greater joys in thine own material experience.

> ***"And he arose out of the synagogue, and entered into Simon's house.***
> ***And Simon's wife's mother was taken with a great fever; and they besought him for her. And he stood over her, and rebuked the fever; and it left her: and immediately she arose and ministered unto them. Now when the sun was setting, all they that had any sick with divers diseases brought them unto him; and he laid his hands on every one of them, and healed them."*** *- Luke 4:38-40, The Holy Bible Rectified Text*

A Clearer Understanding of the Healing Forces

Know what is the Name of your Healer: That Name above every other name! As that Name, named by self, that brings Healing in the physical self, in an experience. So may self, by holding, attaining, gaining that consciousness of the indwelling, and communion of that; Self-Same Spirit, bring Aid, bring Help, bring Hope and Faith, to Another. For the Emunctologist to be an instrument, to give other Healing: That self be wholly free in that source of power, as would bring Hope, Faith, Confidence, and Healing to those who Seek through the Principles given in Emunctology, to be made more aware of His love, in their lives. Not in arrogance by any one; rather seek through meditation, singleness of purpose, to be guided in that channel in which each may Be a channel of blessing to those who seek. In this manner may ye know the way; for, as has been given: "I go; and the Way ye know." The manner in which each may know they are In attune, is the ability to feel that consciousness of the sincere desire Within to Be a blessing, A channel, to someone. One must raise self to that consciousness, of a physical perfection, in spirit, to give the proper attitude or concept to another.

Doubt never Accomplished anything. Will the body-consciousness intend or desire, that may Be a portion of the individuals work. This will be accomplished by a unison of cosmic or universal forces. This may be raised in

Anyone that so Cleanses their Own physical consciousness, or raises the vibrations of their own physical bodies; to that attunement that brings Healing to others.

For, as has been given:

> ***"Who healeth all thine infirmities? Who bringeth the hope, the abounding forces of love, in thine life?"*** *- Psalm 103:3, The Holy Bible Rectified Text*

What Is Life?

It Is Opportunity to Serve the Living God! Life Is Vibration, when Vibration Ceases; so it does Life. If the Electrical Vibration Is Kept On; there is No End to Life. There's no ending! Is there an Ending in life? an ending in vibration? It is Vibration that was created.

As has been given:

> ***"Though I give my body to be burned and have not love, it profiteth me nothing. Though I may be able to interpret, though I may prophesy, though I may Bring that faith so as to remove Mountains, and have not Love, it is Nothing!"*** *- 1 Corinthians 13:3, Rectified Bible*

Then, first know what love meaneth:

> ***"For God so Loved the world that He gave His Son, that we Through Him might have life, and have it more abundantly. From the abundance of the heart the Mouth speaketh."*** *- John 3:16, The Holy Bible Rectified Text*

Thoughts Are deeds, and as their currents run bring either those of Miracles or crimes. As He purged His own life, so may We purge Our lives, that they may be one In Him, and as He laid His Hands on Many, so may the Healing From self be to many, wilt thou Believe and ask in His name. Be thou, then, the Sturdy, Staunch Guide To Many, as thou wert in days that were counted as but naught!

For while Law is Love, Love Is Law. And as healing is the contradiction of Many man made laws, and in line with, and contradictory to, laws that are universal, the last to be conquered is death itself.

Overcome, even as He overcame. So the injunction, Heal even as Peter, that:

"In His name may This be done. In His name give I thee that sought." - Acts 3:6

He Is the law. He Is the destiny. He Is the love.

Hence, this consciousness of His Presence Must be the Basis of All Healing; for: "Be not afraid, it is I", must come To the Emunctologist, as they make their selves One in purpose. Then, Ask Only in His name, believing, and it Shall be done! This an outcome, or the result of self's own development, and, as given in the beginning; let No one come condemning Themselves for that, that is within them! But let no one come in arrogance, as to that, that's necessary for another to reach that Same attunement! Physically, there may be an illustration in this: Attunements on any of the radios may be Somewhere Near the same point, but no 2 will Ever be in exact same ratio! For their Positions alter that, even when sitting side by side! So, individual attuning their soul-consciousness to the divine within, must attune according to their Own development one in another!

But Condemn Not, that ye be not condemned! Find Good in all! If thou cannot speak well, speak not at all! And think not at all! For thoughts Are deeds.

As ye act, let that gladness of purpose as may be One in all, be that, that rules, or is guided by Him that rules. Rule not in the sense that: "Here's a line, and it must be hewed to, irrespective of consequences or of conditions!"

For He is Also a God of mercy; Mercy that makes us All akin, in that; he that would have mercy shown Must himself be merciful!

Being named and called to be an Emunctologist, a Healer, in what way, and manner are you able to Heal?

Here, let's analyse Healing for the moment, to those that must consciously see and reason, see a material demonstration! Each atomic force of a physical body is made up of its units of positive and negative forces, that brings it into a Material plane. These are of the Ether, or Atomic Forces, being Electrical in nature, as they enter into a material basis, or become Matter, in its ability to take on or throw off. So, as an Emunctologist, may raise the atomic vibrations, that make for those positive forces, as bring divine forces in action into a material plane, those that are destructive are broken down by the raising of that vibration! That's Material.

This is Done through Creative Forces, which are God in manifestation!

Hence, as self brings those Little things necessary, as each is found to be necessary, for position, posture, time, period, place, name, understanding, the Emunctologist mus Study each, and assist each in their respective sphere.

So does the Emunctologist Become a Healer.

As the Emunctologist development is, that there must be raised in each individual that consciousness of the indwelling, or the Superseding of the Christ Consciousness, So, all these receive their consideration, as has been given: To whom ye speak, How ye speak, where, when, and How; these

Must All Be considered, would one Not become arrogant, would one Not become self-centered, self-condemning.

Self surrendering first; then raise the consciousness that will supersede, will overcome, for only in His name may the world, and Its environs be overcome; for, as He overcame even death. So may Ye in His name overcome the ills that the flesh is heir to, through its advent into a material world.

> ***"I am Not of this world. Ye are not of this world, if Ye abide in me, but I may only be Manifest in the material world through thine Own raising of that consciousness. As I abide in the Father, and ye abide in me, I in ye, ye in me, we may bring that to pass As ye seek."*** *- in "Christ-Consciousness", The Book of Emmanuel or God among men.*

Remember; there must first be the Desire on the part Of the one to be healed! You cannot create them, no matter what thou hast! God cannot save a man that would Not be saved!

> ***"Let them seek, not ye prepare or present to them without their seeking."***

The Therapeutic Importance of The Mental Attitude

"It has always been recognized that the confidence and co-operation of the patient were generally essential for success. If an attitude of confident expectancy in the patient be the most essential element of success. What extent States in Consciousness, and Subconsciousness Influence the Activities of the Tissue Cells; or to what Degree those Deepest Physiological Processes, which we usually describe as Automatic Reflexes, and Physical Adjustments, May Be Modified By The Mental Attitude.

The report of 1 May 1914, after long investigation by the joint committee in England, of leading medical men, and prominent theologians, **Confirming the Efficacy of Mental Treatment ,and qualifying its use.**

Sir Thomas C. Clouston, MD, in "Mind Cure from a Scientific Point of View", Quarterly Review, January 1913, states:

> ***"The brain is the controlling organ of the whole body, its master in movement, sensibility, nutrition and general health."***

He states that through the mind glandular secretion is stimulated, pain, paralysis and disease are produced, resistance to infection is lessened and immunity acquired.

He quotes John Hunter as saying:

> ***"As a state of mind is capable of producing a disease, another state of mind may effect its cure."***

Many investigators and clinicians have demonstrated, by practical experiment and experience in direct suggestion, hypnosis, hysteria and other mental conditions that, through consciousness the nutrition, the circulation, and the sensory activity of a part can be modified. Therefore, through consciousness this trophic energy, and so the general condition of a part, can be influenced.

But if **consciousness acting in and through the nervous system is a constantly active cause affecting the physical activities of the tissues**, we should plainly see in ourselves, and in others, the direct influence of states in consciousness.

I believe that such an influence can be demonstrated to be constantly active, but in order to properly interpret it we must have some comprehension of the processes of effective mental action. **Experience of the past, ideas and sensations that have been presented to the individual consciousness, remain thereafter actively present in the mind as potential, impulsive elements.**

It is possible for only an infinitely small proportion of these elements to be individually present in full consciousness at any one moment in time, but grouped and arranged through their associations into complexes, constellations, etc., they fall below the threshold of ordinary consciousness and become co-conscious or unconscious potential activities; indeed such submerged complexes, while still potentially effective, may, from many causes, become so deeply buried as to be lost to ordinary recollection.

These accumulated and generally subconscious activities result in the compounding of what we may term the Mental Attitude, and this Mental Attitude is the effective agent of consciousness, which in its functioning manifests the direct influence of past experiences. These potential centres may

be stimulated into functional activity through the recurrence of some previously experienced ideational or sensory impression which, through accidental relationship, misdirected attention or direct volition became associated with the special submerged complex, and now acts directly to arouse its energy. Thus, we discover that it is not the present conscious thought that directs the creative energy of the mind, but this deeper and more complicated Mental Attitude.

The Mental Attitude constantly varies as its composition changes, but it tends to become more and more fixed and stable in its influence and more and more automatic in its action. In all this we find the key to the cause of most of the subjective occurrences of life: to character, to habit, and to the other elements of personality. Thus, we can see how a submerged complex is frequently the cause of definite abnormal conditions of mind and body, and how forgotten and innocuous incidents in the past have become, through the law of the association of ideas, the effective initiating agents of serious pathological condition. In this way some one of an infinite variety of ideas concerning life, health, or disease may easily become the dominating element of a constantly functioning complex. For example: **a complex may evolve about some idea of ability, of power of self-control, or some fear of disease or failure, some early acquired prejudice or antagonism, or some accidentally aroused antipathy.**

Any such complex may constantly functionate, or may at any time be Aroused by a Stimulus Effective Through Association, and any such Mental Attitude, may become active while The Relationship Between the Stimulus, and the Effective Idea, remains quite unrecognized, and indeed unknown in consciousness. Pathological Conditions Originating From Submerged Ideas Are So Common In Daily Clinical Experience. Not only Do Mental Diseases Begin In This Way, But Many Physical Disorders, Are the Direct Result of Abnormal Mental Attitudes. Thus in submerged complexes; We Often Find the Causes of Disturbances of Circulation, Digestion and Respiration, and of many Convulsive and Spasmodic Conditions, such as: Asthma, Hay Fever, Diarrheas, Nauseas, Various Neuralgias, and Other Disorders.

We constantly see: Warts Removed, Rheumatism Cured, Palsies, and Neuralgia Relieved, by some simple and often absurd process which catches the attention of the subject, and Changes the Controlling Mental Attitude.

Many cures wrought by these various strange measures are well authenticated, and it is a suicidal mistake of our profession to shirk analysing them. We gain nothing by hiding behind such words as “bosh”, “fraud”, “deception”, or “humbug”, on the one hand, and “hysteria” or imagination” on the other. The study of these phenomena and the application of the scientific

principles underlying them, are the Science of Psychotherapy. Every physician practices this science, for we all recognize that all our knowledge and all our work will be practically ineffectual if we cannot gain the confidence of the patient either in ourselves or in our work or in our remedies.

Psychotherapy is, therefore, not a new field. It is the oldest field of all, as its principles alone survive the constant change in medical and surgical procedure.

Scientific Psychotherapy is still in the experimental stage.

We can, however, state clearly these conclusions:

1. Many abnormal physical and mental conditions are due to injurious Mental Attitudes produced by the presence of irrational complexes.

2. The important step towards relief is to discover, through mental analysis, the nature and the origin of the injurious complexes.

3. To bring about relief from the unhealthy conditions, it is necessary to dissociate these abnormal complexes from the normal elements of consciousness, to disintegrate them, and to reintegrate their elements in association with health impelling ideas.

No Two Minds act on exactly similar lines, and it is, therefore, impossible with our present knowledge to lay down any definite rule for procedure that can be followed in every individual case. The food of the mind is the subjective ideas, and the objective sensations reaching it, and the first principle must be to see that through consciousness the mind of the patient receives helpful, healthful food. The elements which constitute this food are popularly known as suggestions, and we cannot escape the fact that we are constantly giving effective suggestions to our patients.

We must, therefore, study to make these suggestions helpful and healthful.

If we have the willingness, we can soon learn to add to the indirect and often unintended suggestions which we are of necessity constantly making direct, forceful, constructive suggestions which will be of material and immediate benefit. Indeed we shall find that the majority of our patients will meet us more than half way in this, and either by their own volition or through our suggestive help, assume that attitude of relaxed expectant attention in which the latent powers of the mind can best be aroused and regulated. The use of these, as well as a knowledge of the human body in health and disease, is necessary, but I

urge you not to stop with them. The human body is a machine impelled and directed by a mind, and we must strive not only to understand the mechanism of the body, but also to comprehend the working of the mind, if we desire to do the best possible. That is, the greater our knowledge of psychology, the greater our success in our work and the greater the service we are able to render to our confiding patients." - in "The Therapeutic Importance of the Mental Attitude of the Patient", Journal of the Colorado State Medical Society, March 1915.

Instruction for the Physical and Spiritual Sustenance of the Body; Concerning The Correct Mental Attitude for Healing

To be Bound; by any Set definite period of activity, whether mental or physical, is one, among many, of the conditions that can cause the Rebellious Forces to arise within the body: Mentally and necessarily Physically.

With the arising of Rebellious Forces, or some physical pains that may be minor in themselves; and necessary to be met by the filling of self With the hopes, and the desire to overcome (and these being so overcome by the desires that have been allowed to be builded), the body cannot assume an Attitude of:

"I will eat this because it pleases me."

Then the individual becomes in a manner the slave to self's own Indulgences, in:

1. **Mental Things**
2. **Physical Things**
3. **Material Things**

To overcome Health Conditions, it requires that there be made by self a definite stand to be taken; that is:

"If there is given me a definite program to follow I will; I Will; I Will adhere to it, no matter What I may suffer mentally or physically! I will Trust in the Divine forces innate, and now submerged often; within my inner self for the Strength to Endure, for the ability to say No when I should! I know a Diet is necessary in my physical condition.

I will adhere to that I Know is not harmful.

I Will adhere to the use of only that which is beneficial now and hereafter for my welfare.

I will take such medicinal properties only that Will Add To My Physical Well-Being! I will take such mental and physical exercises that add to those things administered in the Chiropractic Adjustments, and in the medicinal properties for my well-being. I will so conduct my own reading, my own studying, my own associations, in such a manner as to be beneficial to my physical and mental well-being. I will Think; I will act; I will consider Others needs Before My Very Own; even in my ministering to that within myself that requires adjustment mentally and physically!" Where, then, may this be accomplished?

First that determination must be found in self's Own mind, heart and soul; for, as the body knows, it is not All of death to die, neither is it all of life Just to live! but to be of a service to someone else is the Only way that life is made to be such as to bring contentment, and to find the joy, the pleasure in living."

With such a definite stand taken, there may be then, and only then, followed the Program of Treatments, given by the Emunctologist.

Concerning The Correct Mental Attitude of The Seeker

Along side with the Applications of Therapeutic Measures; must be made with The Mental Attitude of the Seeker, in relation to self and to others.

Not as of centralizing thought in one direction, so that when there come mental distortions through physical reactions; that there is the activity of the mental in the same distortion or manner, but rather that the filling of the mental body with thought and activity that brings the greater distribution of activities; To the mental body.

The little things said by others, that seem to be naught to them, stabs, hurts, and produces for the body that of retort that brings; Detrimental reactions, and the body hates self, and dislikes the surrounding effect of conditions.

Thus, in the application, of mental self; would be in the manner to so fill self's time, self's mental forces, with that as may be accomplished; in the word, in the deed; that the body will; Continue in finding self satisfied in; Doing for others; and he that aideth, he that helpeth one, is Lending to the Lord.

Keep; That ever before self, and there will come a peace that has not been felt.

Put self rather, then, in the hands, in the mind, of the; Divine from within, and not attempting, not Trying to be good, to be kind, to be thoughtful; but just Be, and Consecrate self to the service of others.

This peace, this quietness that will come within self from such, will find a ready answer in the mind, in the heart, in the life, in the expression of those; every one; whom the body contacts. This is Living consecration, and not attempting to be moral for moral's sake; not attempting to be good that good may come; but be good that there may be that peace; that understanding, that only comes from putting self in the hands of the divine. Study, then, portions; Any portion; of the words of Him that gave that:

> *"That ye ask in my name, Believing, that shall ye have within yourself." - Mark 11:24*

Do not, then, in asking, make conditions, but surrender self unconditionally into the hands of the divine from within, and that from within shall answer; even as was said:

> *"My spirit beareth witness with your spirit that ye are called the sons, the daughters, of the Living God" - Romans 8:16*

For in Him only is that peace, and the blessings of those whom the body Contacts will bring the greater joy, the greater happiness. Happiness, then, is not a thing set apart from self, but the conditions with which one approaches that in hand to be Done! for when one considers that the position of self is hard to bear, is not as is desired, the desire of the heart often maketh one Afraid; unless that desire is ever in that attitude of:

"Use Me, O God, as I am", for the I AM is ready, willing, to make My will One with Thy Will:

> *"Though He slay me, though He bruise me in mine own selfish or unseen ways; yet will I trust Him day by day" - Job 13:15*

Trust In Him

And He will Not forsake thee; neither will He allow thee to be afraid; for He will raise thee up, and He understands all the hardships, the Little things, the separations, the variations in the surroundings; but Trust Him!

Put the Trust in Him, and in same Know there comes to the body that strength that is not withheld when the Trust is put in Him.

In this manner may the body, the mental body, the physical body, allow the Spirit of Truth, peace, joy, understanding, come in and make for self, for those dependent upon self, mentally and physically, whole and strong; and able and capable of meeting every issue of Everyday.

Hand Healing Therapy

Hand Therapy is useful, in many conditions, such as from incoordination between the Central Nervous System, and the Sympathetic.

For in the body system, there must be those coordinations with low electrical forces, as creations in the body-forces themselves.

The Emunctologist should know that: Hand Therapy; Must be done in love, in harmony, in the desire for the help, for the proper reactions in the body itself.

Hand Therapy Treatments, should be done after Osteopathic Treatments.

Vibration from Hand Therapy Must be done, by an individual who carries Healing in his Body, and Mind. Hand Therapy Treatments, should last for at least 20 minutes, these Treatments should be preformed, every other day, by placing the hands on the patient right next to the skin, in direct contact with the body.

The Wonders of Water: What Makes It All Possible

"Water is a very special substance. It covers two-thirds of the surface of planet Earth. It also constitutes 75% of the molecules making up the human body.

There is much known about the basic physical properties of water, but very little was known, until recently, about the **Subtle-Energy Properties of Water.**

Much of the Preliminary Evidence for these special properties comes from Studies on the Effects of Laying on of Hands Healing, conducted in the 1960s.

Of all the Healing Research carried out during that period, the most significant groundbreaking work; was done at McGill University in Montreal by Dr Bernard Grad, MD, Biologist, and Cancer Researcher who pioneered laboratory studies of Laying On of Hands, or Spiritual Healing. Dr Grad was interested, if Psychic Healers had real Energetic Effects Upon Patients. He wished to separate the physiologic effects of emotion (placebo effect), from true **Subtle Energetic Effects on Living Systems.** To study this phenomenon, he created a series of experiments which substituted plant, and animal subjects for human patients in order to eliminate the known effects of belief. Of greatest relevance here is Grad's work with Barley Seeds. To create a "sick plant patient", Grad soaked Barley Seeds, in salty water (which is a known growth retardant). Rather than work directly with the Seeds, Grad had a **Healer do a Laying On of Hands Treatment**, on a sealed container of salt water which was to be used for germinating die seeds.

The Barley Seeds were placed by lab assistants in salt water taken from untreated or healer-treated water containers arbitrarily labelled "One" or "Two".

Only Grad knew the correct identity of the salt-water bottles. The seeds were separated into 2 groups, differing only in the salt water with which each group was initially treated. Following Saline Treatment, the seeds were placed in an incubator and studied for signs of germination and growth. Percent germination of seedlings was calculated and statistically compared between the 2 groups.

It was found that seeds exposed to Healer-Treated Water Sprouted More Often than those in the regular saline group.

Following germination, the seedlings were then potted and placed in similar conditions of growth. At the end of several weeks, the plants were statistically compared for height, leaf size, weight, and chlorophyll content.

It was discovered that Plants Watered with the Healer-Treated Water were of greater height and chlorophyll content.

The experiment was repeated a number of times in the same laboratory with similar positive results. Following publication of Grad's work, other labs in the United States had success in reproducing his results utilizing different healers.

Because of his success, Grad utilized the same experimental protocol to test other subtle energetic effects upon seedling growth rate.

Of particular interest was Grad's success in stimulating the growth rate of plants utilizing water treated with common magnets!

Recent studies by Dr John Zimmerman, utilizing ultrasensitive SQUIDs (Superconducting Quantum Interference Devices) as magnetic measuring tools, have detected weak, but **significant increases in the magnetic field emanations of healers hands during the healing process.**

[New Technologies Detect Effects of Healing Hands, Brain/Mind Bulletin, 30 September 1985]

Although the signals emitted by healers hands during healing were several hundred times that of background noise, these levels of magnetism were still significantly weaker than those produced by the magnets which Grad was using in his experiments. **This finding will have great significance when we later discuss the nature of healing energy.** Another unusual variation thought up by Grad consisted of giving water to psychiatric patients to hold.

This same water was then used to treat barley seeds.

Interestingly enough, water energized by patients who were severely depressed had the reverse effect of healer-treated water in that it suppressed the growth rate of seedlings! Because of the positive growth effects attributed to the healer-treated water, Grad carried out chemical analysis on this water to see if energizing had caused any measureable physical changes. There were Significant Changes in Infrared spectroscopy analyses of Healer-Treated Water.

This test revealed that the Atomic Bond Angle of the Water had shifted slightly from normal. Minor shifts in the molecular structure of healer-treated water also produced decreased hydrogen bonding between water molecules.

Testing confirmed **a significant decrease in the surface tension of Healer-Treated Water, a result of the altered hydrogen-bonding between the energized water molecules.**

Curiously, Magnet-Treated Water Showed Similar Decreases in surface tension as well as positive effects in stimulating plant growth.

[Robert Miller in "Methods of detecting and measuring healing energies", Future Science, 1977] Studies by Douglas Dean and Edward Brame ("Physical Changes in Water by Laying-On of Hands," Proc. 2nd Internat. Conf. Psychotronic Res., 1975), and more recently, Stephan Schwartz, with Edward Brame and others, ("Infrared Spectra Alteration in Water Proximate to the Palms of Therapeutic Practitioners", Research in Parapsychology, 1986), have replicated Grad's findings of alterations in infrared spectroscopy and bond-angle changes in healer-treated water. **This material has been presented not so much for its relevance to Psychic Healing, but because of the significance of these findings in illustrating the Subtle Energetic Properties of Water.** This is a critical point which has been missed by most researchers familiar with these experiments on Healing.

It would appear that **Water can be "charged" with and then "store" various types of Subtle Energies. Subtle Energy of both a beneficial and detrimental nature, can be stored, as evidenced by Grad's studies utilizing Healers, and Depressed Patients. Treated Water was able to induce measure-able changes in: Plant Physiology and Growth**, although there were no physical substances added to nor detected in the water.

During the process of energizing, the healers had no physical contact with the water within the sealed flasks.

Their hands were separated from the water by the glass walls of the containers.

These experiments on the subtle energetic properties of water have relevance in examining the known Principles of Homeopathy." - Dr Richard Gerber, MD, in "Vibrational Medicine", 2001.

The Attributes of the Psychic Forces Manifest in a Physical World

The soul created perfect in the beginning, with that passing through the earth plane wherein it may obtain its body to present before the Creator.

The Psychic Forces is the action; not the spirit, not that produced, but the action of same in physical plane, and as we see in this, and there may be summed up in all of psychic phenomena that of the expression in action of spirit forces through, whether of the 1, 2, 3 or 4 forces or fold of the body, and the development, and the lack of seeing the expression of psychic forces because the individual allows the physical, or conscious mind, to so crowd out the forces as is manifested in the world as to become unconscious, unthoughted, of the existent condition.

Healing by Laying On of Hands

"The Laying On of Hands, was always an important part.

In the British Museum there is a bas-relief taken from a tomb in Thebes, showing the subject sitting down while, at a short distance from him, a man is standing with hand uplifted, evidently about to make a "pass" over his patient.

Isis, on the Zodiac on her temple at Benderah, is represented as making the same "passes." According to the Ebers Papyrus, medical treatment prior to 1552 B.C. included LH on the head of the patient.

In Greece, the value of Laying On of Hands treatment was known for a long time. Aristophanes saw it being done in Athens about 4 centuries before the birth of Jesus. It played a part in the cures of the Asklepian temples where a blind man's sight and a barren woman's fertility were restored by the healing hand of the god Asklepios. This experience was attested to in the testimonials left at the temples and by allusions in the literature. Many of the healings of Jesus reported in the New Testament were done by Laying On of Hands, which was subsequendy carried on by the Christian Church.

The Effect of Laying On of Hands on the Growth of Plants

As early as 15 years ago, a series of experiments was begun to see whether animals and plants could respond in biologically recognizable ways to the Laying On of Hands by a man (O.E.), who claimed considerable success with this ancient method of healing.

Barley Seeds implanted in soil in peat pots were used for these studies.

As in the case of the goiter studies in mice, for Laying On of Hands treatment to be effective the organism did not have to be treated directly.

In the case of plants, Laying On of Hands treatment of the solutions used for the first watering was all that was necessary for significant acceleration of growth. Subsequent waterings did not have to be treated by Laying On of Hands. The plant experiments went through several stages of development.

In the 1st series of experiments, the solution was placed in an open beaker and held between OE's hands for 15 minutes.

In the 2nd series, the solution was treated while in reagent bottles closed with ground glass stoppers, and in the third series, sterile solutions were treated in sealed bottles.

In all 3 types of experiments, plants treated with water that had been magnetized by Laying On of Hands grew significantly faster and/or more abundantly.

In the study involving treatment of solutions in sealed bottles:

The Emotional State of a Person At The Time of the Treatment of the solutions, was shown To Be Of Crucial Importance In Determining what effect such solutions would have on the growth of barley seeds.

The study involved 4 groups of plants:

1 group watered by a solution treated by a person who had a “Green Thumb”, 2 groups treated by solutions held by persons who had been psychiatrically diagnosed as suffering from a Depression, and a 4th group watered by a solution that had not been treated by anyone; it served as the control group.

The outcome revealed that the plants watered by the solution treated by the person with the “Green Thumb” grew better than those watered with the 3 other solutions. Of some interest was the finding that the plants watered by the solution of one of the depressed persons grew the slowest of all.

State of Healer

Mesmer claimed the results obtained by his method were due to the passage of an energy from the healer (magnetiser) to the patient. In the human situation, the transfer of energy to the patient in mesmerism therefore appears to be a function of the mesmerist's physical and emotional state and not directly of his will or any mental exertion.

> ***"I laid my hands. Then I asked God, to help me and direct his healing energy to the patient. I also prayed that God's light and love, would enlighten my patient's spirit, so that his soul would be better able to receive divine healing rays. The healer serves as a conduit for this healing energy."*** *- Rosemary Altea, Healer*

Healing by Laying On of Hands

The Laying On of Hands is a biblical expression and is an essential part of what later came to be called Mesmerism. As it turned out, these studies were also a critical test of Mesmer's fluid or Energy Theory.

Later proponents of a vital energy, such as Karl von Reichenbach and Wilhelm Reich, who, more than anyone else, extended our knowledge of life energy, experienced the same rejection as did Mesmer.

However, Mesmer was allowed to die at home in his 80's, but Reich died in prison at the age of 60. Never again in the 175 years between Mesmer and Reich was the idea of a Vital Energy taken as seriously by so many men of intellect as was the case in Mesmer's time, and never since that time has it come so close to entering the body of science. Success in Healing by Laying On of Hands would appear to depend on a certain way of bodily functioning, involving a certain awareness by the healer of his own bodily energy, and the energy around him coupled with a certain way of utilizing that energy.

Much of the Healing done by Jesus, was by Laying On of Hands.

Therapeutic Effects by Laying On of Hands

For example, in those who are able to produce some Therapeutic effects by Laying On of Hands, it is likely that the therapeutic situation itself is such as to provoke the streaming of a greater than normal amount of energy down the hands of the healer and thence to the patient, where it can do its work of healing.

A critical part of the psychological attitude of the healer is that he be in such a frame of mind that he can receive the energy from a still more powerful energy source. That is, the chain of energy flow is from God to healer to patient, and for the chain to be complete the patient must be open to the healer while the latter must be open to the higher energy source.

The emotional state of the healer may be decisive in determining whether the outcome for the patient is favorable or unfavorable. Not only are psychological and physical factors involved, but as with any talent, sociological factors may in

fact determine whether or not such an ability will surface to consciousness.

The plant experiments previously reported, involving a person with a “green thumb”, and 2 depressed patients, revealed that there is a correlation between the qualitative effect produced by the energy transferred by Laying On of Hands and the emotional state of the person “magnetizing” the water.” - “Dimensions in Some Biological Effects of the Laying on of Hands and Their Implications”, Dimension in Wholistic Healing: New Frontiers in the Treatment of the Whole Person, 1979.

“Dr Bernard Grad, Canadian biologist, considered one of the foremost Researchers of Laying on of Hands Energy Healing.

His influence and legacy remain today, historic and groundbreaking.

While studying at the university, **he also began studying with Dr Wilhelm Reich. His work and thinking were profoundly changed through his contact with Reich’s work. He was captivated with Reich’s ideas related to Orgone and the concept of Life Energy.** and considered him to be a mentor.

The time with Reich significantly impacted him. It was, also, near the time of Reich’s death, that he met the Hungarian healer, Estebany.

It was thru this meeting, that Dr Bernard Grad, came to experience personally the felt sense of Energy Healing. These experiences altered the direction and course of his research. He began researching Healing, and its effects.

He researched wound healing in mice, comparing the healing rates of mice held by an identified healer, to those of mice not held by a Healer. His research showed an increase in the rate of wound healing times with the mice that were held by the healer’s hands. He looked at the growth rate of seeds and plants which had been watered with water held and treated with energy by different people (including the healer Estebany, a lab technician and a depressed patient) and compared it with the growth rate of seeds and plants where untreated water was used.

He found a significant increase in the growth rate of seeds and plants exposed to the “treated water.”

He found that when Healing Energy was involved, there was an identifiable difference in positive outcome greater than the control in which no healing energy was used.

This research and others were done through 1957 on into the later 1900’s.

Dr Grad’s research laid groundwork and opened doors for future research in the field of Subtle Energy, and Energy Medicine.” - in “Subtle Energies & Energy Medicine”, 2010.

> ***"Always begin your Treatment by Allaying the Fear of patients. Silently Reassure them as to their Exemption From Disease and Danger. Watch the result of this Simple Rule of Christian Science, and you will find that it Alleviates the Symptoms of Every Disease."*** *- Mary Baker Eddy, in "Christian Science Practice", Science and Health with Key to the Scriptures, 1875.*

Therapeutic Touch

"The variables that can affect the health and well-being of living systems are multitudinous. An alternative avenue for research is suggested in work done by Grad using **Near-Infrared Spectrophotometry of Treated Water Samples** (JASPR, 1965).

Dean and Brame continued that line of research, and their results supported Grad's findings (Proceedings of the Second International Congress of Psychotronics, 1975).

Those who Trained in some kind of Therapeutic Technique and characteristically involved themselves in such activities Produced More Significant Results than those who had not undergone such training, or who did not characteristically involve themselves in such activities.

This study supports earlier research suggesting the existence in Water of an objectively measurable infrared signature which is independent of measurements on living systems. The central difficulty in interpreting these results lies in the session controls, some of which also had altered spectra. The cause of this is undetermined. Environmental influences do not provide a compelling explanation for either the overall effect or for the changes in the session controls." - in "Research in Parapsychology", 1986.

9 - To Apply Correctly All the Knowledge Received at the School of Health in Emunctology

The Emunctologist should apply all the knowledge received at the School of Health in Emunctology.

For Any Cancer Treatment to be Successful, It Must Fulfil 2 Fundamental Components:

> ***"1. The first component is the Detoxication of the Whole Body, which has to be carried out until all the Tumours are absorbed, and the essential organs of the body, are so far restored that they can take over this important "cleaning function" by themselves.***
>
> ***2. Secondly, The Entire Intestinal Tract has to be restored simultaneously; with the restoration of the Intestinal Tract, the most important secretory functions will be repaired, as well as its circulation and motility regulated by the Visceral Nervous System.***
>
> ***Immunity means that no abnormal cell can grow or develop in the body with normal metabolism. For that purpose, the degree of restoration of the Liver plays a decisive role."*** *- Dr Max Gerson, MD, in "A Cancer Therapy", 1958.*

With the Blood and Liver cleansed, circulation is improved, enhancing the pathways for transmitting hormonal messages and communication between the various organs of the immune system.

The Book "Emunctology, Principles and Foundations of the Emunctory System", 2021, along with this present volume "Emunctology Reference Manual", 2025, serve to:

The John Braund Method of Cancer Treatment

"In 1948 the New South Wales government instituted an inquiry into the claims of John Braund, that his secret treatment had cured 317 cancer sufferers.

When he was 23, he had been given up by doctors as a hopeless cripple but that he discovered "key" truths about the blood circulatory system and had cured himself. He said that he was now applying the same insights to cancer.

Braund believed Cancer was caused by a problem with bodily Circulation (a

blockage in the blood stream), and hence was amenable to Massage, Hydrotherapy, and Blood Detoxification.

Braund believed that it was critical for Blood to be moved away from a person's heart and in order to achieve this would Massage his patient's legs and feet, and use warm water Foot Baths. The more spectacular part of his treatment that news coverage dwelt on involved Braund injecting the patient with his secret formula. Sometimes he would inject the tumour itself or make a series of injections around the tumour, and sometimes, with internal cancers, he would inject a close or, in Braund's opinion, related part of the body, such as in one case of uterine cancer where Braund injected the woman's lower back.

The solution was milky in appearance, and had a distinctive smell, which one observer reckoned was ammonia. When Braund injected the tumour or around the tumour, the flesh would die and, after 10 to 20 days, would slough off, leaving a "purulent ulcer" at the injection site which Braund would bandage and leave to heal. In the other instance, Dr Ulric Williams, MD, in New Zealand was offering patients the Koch–Baker cure – a cancer-killing injections popular in the United States in the 1920's and 1930's." - in "John Braund, and Regulating Cancer Treatment in New South Wales, Australia", Med. Hist., April 2013.

Braund Method of Cancer Treatment

"In Beverly Hills near Sydney, Australia, **John Braund, Treats upwards of 30 people a day. John Braund, 78 years of age, with No Medical Training, yet he is able to produce Many Patients Who Claim Emphatically that they Have Been Cured of Cancer.**

Mr Braund claims that:

"The Primary Cause of Cancer is a Blockage in the Bloodstream."

1. First Stage: Consists in Detoxicating the Blood, as far as possible, and ensuring adequate Blood Circulation, especially in the minute capillaries. The Braund Method insists that the blood be swept away from the heart, and not to it.

2. Second Stage: Is the injection into the tumour or growth of a liquid (smell of ammonia, thought to be Alum), after a lapse of 10 to 20 days the tumour now dead and shrunk to a quarter its normal size.

> *"I have been treating malignant growth for 20 years, I took 1 case before the Cancer Research Board in 1933, and Professor MeCallum who was chairman of the board said:*
>
> ***"You are treating these just like glorified boils, that's all they are."***
>
> ***He asked me then how many more I had or was doing; I said 6 but I had 8, they promised to come next morning, and I've not seen them yet, and that was 14 years ago. I've challenged them here a few weeks ago, to provide a certain number of patients certified by them as cancerous growths; but they'd have to be approved by me to say that they would have cancer, and if I said they had cancer I'd be satisfied. And I would take them and cure them, providing that they didn't look at the patients during the time from the time that I started till the time that I finished.*** *Then I'd hand them over I have cured many people, but particularly 318. Those were all malignant growth I would like cameraman to interview some of those that I have done, and they can see for themselves whether it has been a malignant growth or not." - John Braund*

The first patient is Mrs Jackson, who had a very large breast tumour removed a week ago. The wound is healing rapidly, and her general condition is good.

> *"I am one of Mr Braund patients, and* ***I feel since Mr Braund has removed the grace that I had, I have a new lease of life. I had [Medical Trade] Ray Treatments for the grace, and which I made no progress at all.*** *After I'd finished my treatments, I was feeling so ill in and so sickly and run down but I really think that by now I just wouldn't be here at all.* ***I'd like to say here and now that Mr Braund is a very remarkable man, he removed my grace in a manner that's really amazing without anaesthetic, without bleeding without knife and without pain which I consider no [Medical Trade] Doctor could possibly do."***

Now, a man who had a Cancer removed from his face by a surgeon some years ago, but another grew.

> *"My name is Austin Reddicks, I am the justice of the peace.* ***For the last 3 years, I have been under specialist treatment for cancer. In October 1946, I had glands removed, I was advised to see Mr Braund, and he assured me, that he could cure me of cancer, without the use of the knife. And I am very pleased to say that he has done so, and is to be hoped the world will benefit by his remarkable discovery."***

> *"My name is Bert Higgins,* ***some years ago I was informed I was suffering with cancer. I felt quite confident myself that that was correct owing to the knowing pains, that I***

> ***suffered in my stomach, pains in the side and on my spine. I was fortunate enough to meet Mr Braund who diagnosed my case as cancer he took the growth from my back. That's just 4 years ago and since then I've had no recurrence of the trouble whatsoever."***

> *"My name is Arthur George Davis,* ***about 15 years ago I had a very bad endless diagnosis, very bad cancer, and the local doctor sent me down to a specialist in Sydney, and he treated me with Radium. It appeared to be cured then but it came back again, and then it got very bad and I went to the local doctor again, and he sent me down to another specialist, and the specialist said for Diathermy Treatment. But the man said it was far gone, he couldn't treat me with that and he sent me to a surgeon. And a surgeon said that I'd have to have me face practically I've cut off. I was advised to go to Mr Braund and from the very start he said it was a very bad cancer, but he said he could cure it and he guaranteed he took weight off my mind. That's roughly about that is 2.5 years ago, and I've been no reoccurrence of the complaint since."***

Mr Gifford had cancer of the liver, Mr Braund states his treatment has brought the growth to the surface, and he is extracting it without anaesthetic or pain to Mr Gifford, who 3 weeks ago could not bear the slightest touch to his stomach.

Minutes after the operation Mr Gifford walked briskly from the surgery, apparently no more affected than if he'd lost a loose tooth.

> *"Some time ago about the 17 November 1947, I had a stomach trouble diagnosed by a leading Melbourne surgeon as cancer of the liver, it was a recurrence I'd had. A cancer removed from the lower bowel, 4 years ago. Three minutes ago I had the cancer removed by Mr Braund, here it is in this bottle during the time Mr Braund was treating me, I was not confined to bed, I was able to get about quite well, and I think I put on a little weight, that is before the cancer was removed. I feel fairly well today, quite well, able to go about, and I think well. Mr Braund tells me I'll be quite all right in 3 weeks time." - Mr Gifford*

BRITISH
PATHÉ

Can John Braund Cure Cancer? (1948)

Here is the opinion of a Cancer Authority with a world reputation:

"I've been watching Mr Braund work for nearly 4 years, and I know too much about cancer I have any doubts about his being able to cure at least some forms.

He seems to have some cure for malignancy I'm sure that when the time arrives that he will make his formula known for the benefit of humanity and earn the gratitude of cancer sufferers throughout the world. He is anxious to secure recognition for his work, and is not concerned with any other purpose whatsoever. It is not impossible that a layman should discover a cure for a scourge which has baffled the world's greatest scientists it is well to remember that some of the world's greatest discoveries have been simple things made by simple men." - Dr Henry L Brose, Doctor of Science, formerly Professor of Physics at the University of Nottingham, England, Elected Member of the Imperial Cancer Research Committee, and cancer Lecturer at Sydney University from 1935 to 1938." - in "Can John Braund Cure Cancer?", British Pathé, 1948.

Braund Method & Technique

"The Braund Treatment consists of Massage and Hydrotherapy, with the view of restoring the circulation; and when the patient's condition is judged to be satisfactory a local injection of some substance is made into a selected portion of the patient's body.

The Essential Treatment, which forms the basis of Mr Braund claim, is the injection. The Committee was not given an opportunity, as promised, to see Mr Braund actually inject his secret cure into a patient, nor did he divulge to them what he injected. It is a secret remedy.

The medical members of the Committee, however, have seen the results of such injections and can readily visualize the technique.

The injection treatment consists of injecting an escharotic fluid into the subcutaneous tissues. The ulcers resulting from this injection are shallow and indicate that the fluid has a localized necrosing action.

All such escharotic fluids coagulate the albumin of the body tissues and fluids, occlude the blood vessels and are not absorbed into the general circulation.

It must be noted here that Mr Braund does not inject the fluid directly into the blood stream. There can be no question, therefore, of such fluid having any remote action on parts of the body other than the site of injection.

The site of injection may be some considerable distance from the actual cancer. For example, the patient is injected over the sacrum (termed by Mr Braund the "genital vertebra") or perhaps the lumbo-sacral junction for cancer of the womb or lower bowel, over the lower dorsal vertebre for cancer of the stomach, or in the abdominal wall for cancer of the liver.

Within 2 or 3 weeks from the time of injection a slough of necrotic tissue is removed from the site of injection, leaving a purulent ulcer varying in size up to 6 centimetres in diameter, and about 1.5 cm to 2 cm in depth.

Further injections may be made from time to time.

The ulcer gradually heals during several weeks with the formation of scar tissue. There are numerous substances which, if injected into the body, will produce necrosis with separation of a slough similar to that produced by Mr Braund's technique. **Mr Braund's Treatment is not unique, since he has had numerous precursors in his special field.**

In 1932 the "Roberts Cancer Cure" was launched with great Press publicity in Queensland, and a public company was formed with considerable capital to exploit what was claimed to be an absolutely certain cure for cancer.

The essential part of the Roberts cure was an injection which produced necrosis in a similar manner to Mr Braund's method, though, no doubt, the escharotic employed may have been different. About 1936 the "Koch-Baker Treatment" was introduced into Australia from U.S.A.. There is perhaps no need to say more than that there is a striking similarity between these Treatments and that employed by Mr Braund. The technique is similar, the resulting necrosis is similar, the theory on which they are based is similar, and, unfortunately, the outcome for the patient is likewise similar." - in "The Medical Journal of Australia", 29 May 1948.

What Happens When Someone Starts Questioning The Medical Trade Cancer Protocol

"Dr Kat Lindley, MD: How did your colleagues react, when you decided to Question the Standard Cancer Protocol?

- Dr Jamie K. Waselenko, MD: **I will tell you that I had drank the Kool-Aid, and was Indoctrinated in Pharmaceuticals just like everyone else.**

I used to tell patients very stupid things like; Diet Doesn't Matter, and I'm surprised to even hear people come back from well-known universities, and still have that same mantra spoken. But I didn't wake up till Covid-19 "Pandemic." When Covid-19 occurred, I had a lot of cognitive dissonance, I saw a lot of really smart people saying very unwise things.

The other part of this, and I really do believe this was a God thing, he ripped the eyelids off my head during that time frame. I actually started looking at animal data, and the Vaccine Data from the RSV Vaccine in the 1960's, things that I would have never normally done as an Oncologist.

And so, it was during that time frame that I realized that everyone, or everything (both: humans & animals), that had been Vaccinated Did Worse.

So, I was really not on board with that. And so, that's when things at my own institution kind of, became very strained. My partners couldn't see it.

I tried to explain to them concerns. Unfortunately, the Chief of Medicine, could not understand that. And so, I made the decision that; I Wouldn't Take the Covid-19 Vaccine, nor could I endorse it for my patients without long-term safety data. So people that I knew and trusted and respected did not agree with me. So, I ended up leaving my institution in 2021. I recognized, I'd only ever been trained to be a Big Pharma Salesman, because there were simple things in

Oncology, that I should have always known, like: how Glycolytic Cancers are, and how Diet Matters." - Dr Jamie K. Waselenko, MD, FACP, FICT, in **"Rethinking Cancer: Root Cause Over Routine Care", Independent Medical Alliance; non-profit working to Expose Corruption in Medicine**, 29 October 2025.

> ***"Many studies have found that glycolysis promotes tumor growth, metastasis, and chemoresistance, as well as inhibiting the apoptosis of tumor cells."*** *- in "The significance of glycolysis in tumor progression and its relationship with the tumor microenvironment", Front. Pharmacol., 14 December 2022.*

Glycolytic Cancers are tumors that exhibit a high reliance on glycolysis, a metabolic process that converts glucose to lactate, even when oxygen is present.

This phenomenon, known as the Warburg Effect, allows cancer cells to grow rapidly by providing Adenosine Triphosphate (a nucleoside triphosphate that provides energy to drive, and support many processes in living cells) quickly, supplying building blocks for biomass synthesis, and creating an acidic tumor microenvironment. **This metabolic shift supports cancer aggressiveness, invasion, metastasis, and helps cancer cells evade the immune system.**

Chaga Extracts Anti-Proliferative Properties in Melanoma Skin Cancer

"Inonotus Obliquus (Chaga) a fungal parasite of birch trees, **used for centuries due to its curative powers against Cancer, and Infectious Diseases.** Over the past decade, Several Studies have examined **the Anti-Tumor Properties of various Chaga extracts, and demonstrated remarkable efficacy of this natural product in the Treatment of Solid Tumors** in mice. We sought to determine if ethanol extracts from Chaga affected the oncogenic properties of cultured melanoma cells. **Chaga Treatment Led To Melanoma Cell Toxicity in a dose dependent manner. The data suggest that ethanol extracts of Chaga: Induce Cell Cycle Progression, Alterations, and Cell Death in Melanoma Cells. Similar results have been reported for other cancer cell types; where Chaga Induces Apoptosis (death of cancer cells), as well as a Reduction in the expression/activity of key cell cycle regulators. These data indicate ethanol extracts of Chaga; are effective in altering the oncogenic (tendency to cause tumours) properties, of mouse melanoma tumor cells."** - in "Ethanol extracts from the mushroom Inonotus obliquus (Chaga) alter melanoma cell viability and morphology", BIOS, 2013.

> ***"She harvests birch bark for oils and crémes (betulinic acid, she says, is useful for Skin Cancer), as well as chaga mushrooms, which grow on the upper branches of birch trees and are very valuable. "Chaga is used for Gastrointestinal Cancers, to both prevent and support the person going through therapy. Chaga is also used for Melanoma; it is being shown to have antioxidant values, even more than acai berry." She says." - in "Women Healers of the World: the Traditions, history, and geography of Herbal Medicine", 2014.***

"In the early 1990's, Ulrich Abel a German Biostatistician published a paper that rocked the world of oncology.

Abel wanted to understand what progress had been made in the 20 years since President Nixon declared "War on Cancer" in 1971, with the signing of the National Cancer Act, the allocation of $1.6 Billion in research funding over the next 3 years, and the Promise of a Cure within 5 years, 20 years later, the United States and its Global Partners had poured many Billions of Dollars more into Cancer Research.

Dr Abel wanted to understand the return on this unprecedented investment.

He reviewed thousands of oncology papers published in the previous 2 decades, and requested analysis and comments from hundreds of oncologists in order to understand the impact, specifically, of chemotherapy in the treatment of Advanced Epithelial Cancer (Epithelial cancer is a type of cancer that begins in epithelial cells, which line the surfaces of the body, inside and out, including organs and skin. The most common type is carcinoma, which makes up 80% to 90% of all cancer cases and includes cancers of the lungs, breasts, prostate, and colon). In other words, how effective is our number one weapon 20 years into the War on Cancer?

Dr Abel's major finding, was that other than lung cancer, and small-cell lung cancer in particular, **there is no direct evidence that chemotherapy prolongs survival in patients with advanced carcinoma.**

Even with lung cancer, the benefit of chemotherapy is:

> ***"At best rather small, and success of most chemotherapies is appalling. There is no scientific evidence for its ability to extend in any appreciable way the lives of patients suffering from the most common organic cancer. Chemotherapy for malignancies too advanced for surgery, which accounts for 80% of all cancers, is a Scientific Wasteland."*** *- Ulrich R. Abel, in "Cytostatic Chemotherapy of Advanced Epithelial Tumors: A Critical Inventory", 1995.*

I first heard about the use of chaga for cancer, in Aleksandr Solzhenitsyn "Cancer Ward", 1966. The main character developed a deadly cancer (melanoma), he ran away into the forest rather than submitting himself to the horrors of "treatment" in the cancer ward. In the forest, he was given a tea made from a fungus (chaga) growing on birch trees, which cured him of cancer, and eventually led to his escape from the Gulag. That dramatic depiction of chaga's healing powers stuck with me, and resurfaced years later when I read that Rudolf Steiner thought that birch trees have a strong affinity for skin ailments, including skin cancer. Knowing the remarkable similarity of growth habit and appearance of chaga to melanoma, **I consulted the medical literature and found that birch trees synthesize a protein called betulin, which exhibits protective activity against many types of cancer cells, melanoma in particular.**

I was not surprised to find that chaga collects this betulin from the birch sap and concentrates it in its fruiting body, the part used to make chaga tea.

Chaga is a dramatic case in which the synthetic approach to understanding a plant or mushroom as a medicine aligns perfectly with a reductionist approach.

As Goethe taught, We Must Learn To Read The Book of Nature, and in this way the plant or mushroom will demonstrate paths to healing for anyone who has the openness to see. We must see the overall picture, the statement it makes to the world. It is telling us about its place in nature and its relation to the human being.

The Chaga is essentially saying:

> *"I am the way to restore balance and harmony when black growths emerge from your skin and threaten to overwhelm your life. I can help you come back to this harmonious relationship that I myself have found with my friend the birch trees."*

I had a patient in a dangerous situation with melanoma who used chaga as a tea and alcoholic extract, each of which concentrates different chemicals and elements from the fungus. My patient was in her mid 60's when she had a recurrence of a malignant melanoma, that was originally found and excised 3 years earlier. With melanomas, recurrence is often an ominous sign and a development associated with a poor prognosis. Since **there are few conventional medical treatments that work for people with malignant melanoma**, she sought me out for alternative care. Five years later, to the surprise of her conventional oncologists and a melanoma specialist, **She Is Free of Disease, and claims to be In Better Health Now than she was 5 years ago." - Dr Thomas Cowan, MD, in "Cancer and the New Biology of Water"**, 2019.

Inonotus Obliquus (Chaga) is specific for Melanoma.

"In nature we never see anything isolated, but everything in connection with something else which is before it, beside it, under it and over it." - in "Conversations of Goethe with Johann Peter Eckermann", 2014.

"You must, in studying Nature, always consider both each single thing and the whole: nothing is inside and nothing is outside, for what is within is without. Make haste, then, to grasp this holy mystery which is public knowledge. Nature is beneficent. I praise her and all her works. She is silent and wise. She is cunning, but for good ends.
" - Johann Wolfgang von Goethe, in "Selected Poetry"

Unofficial Alliance Between United States Public Health Service & American Medical Association; Accepted as Part of Governmental

"An Unofficial Alliance of the United States Public Health Service and the American Medical Association is accepted as part of a Governmental Plan. Nothing Is Further from Moral and Legal Reality. Is it not in the public interest to constantly improve the scientific standing of the Drugless Professions, or to improve The Lot of Medically Unattached Americans? Should not the numerous other Groups of Physicians, Drugless and Manipulative, enjoy the benefits of the millions in tax funds being spent for scientific improvement? Should the patient of a Drugless Practitioner be denied the advantage that will accrue from the spending of these public moneys for advanced Science in health? The proposal is set up to follow the age-old practice of steering All Public Largesse of a scientific nature to the Ultimate Benefit of members of the Privately Owned Medical Corporation; the American Medical Association. Similarly, **only institutions staffed with members of the American Medical Association, seem destined to enjoy the results of such benefactions. It is noted too that all medical staffers within the suggested control agency; the United States Public Health Service, are members of that same group.** Heart Disease & Cancer have been increasing rapidly over the last 50 years, at all ages. Spokesmen blandly note this will get increasingly worse. This committee is well aware of the inroads from other degenerative causes. Notable exceptions in **health enlightenment are to be found in such countries as Switzerland whose Government takes steps to insure a more rounded Dietary in the Basic Food items of its citizens.**

There, **white flour is heavily taxed, while the whole grain, stone ground type is tax free. It has been pointed out in the hearings, by one well-known heart disease authority, that the incidence of cardiac problems is almost zero among natives of south Italy while contemporaries from that region living in the United States experience the disease at the going American rate.**

We plead that more time, and thought be applied to this proposition and that more intensive perusal of the worldwide facts, and figures in Basic Health and Nutrition be brought to bear by this body. **More mature thought can be applied to the possible contributions of the Drugless sciences in this universal health scene with benefit to the many interests involved.**

It seems certain that no one in the Congress would willingly deny the rights and interests of the many thousands of non-medical practitioners, and other physicians outside the ordinary pale of medical acceptance.

Public interest demands their well-being and professional standing be considered in these deliberations.

Additionally; there is the case of Dr William F. Koch, MD, considered by many to be somewhat Ahead of His Time in Medical Science. All the resources of the Food and Drug Administration (FDA), were brought to bear against him after his announcement of an effective Cancer Cure (Glyoxilide) in 1918.

Some Millions of Federal Funds were expended on prosecution costs to remove this man from the scene and certain basic rights were denied him, according to the record. **Constant harassment compelled this man to remove to Brazil,** where he is honored in scientific circles today.

The case of Dr Andrew C. Ivy, MD of Chicago has followed a very similar pattern as far as Official Medicine is concerned. Attention should be focused also on the experience of Dr Joseph Wilson, MD of Pittsburgh and his Muchoricin Remedy for Cancer and Other Common Ailments. It appears in this case that such simple ingredients as wheat, yeast, salt, and water cannot be considered fairly and objectively as raw material for scientific advancement toward an acceptable cure.

The Science of Herbalism was practiced and advocated by Hippocrates, and goes all the way back through the history of man. There is a tremendous potential to worldwide prosperity and well being with a more realistic and improved scientific approach to using products of the American Farm and Forest. Improved Farming of an expanding organic variety, Are Making an Increasingly Important contribution to the Health Status." - Harold Edwards, Vice President, National Health Federation, in "Senate Joint Resolution 41, 86th Congress", International Health and Medical Research Act of 1959, 3 March 1959.

Koch Cancer Treatment

> *"Delaware held her own at the 81st Annual Session of the American Medical Association, which was held in Detroit 23-27 June 1930. On 24 June, ye humble editor of this epitome of erudition was elected to the Board of Governors of the American Medical Editors and Authors Association, for a term of 2 years.* ***We are quite certain that all the Delaware doctors who were in Detroit have returned home without contamination by the Great Cancer Curer, Dr William F. Koch, whose name somehow or other did not appear on the official program."*** *- in "Delaware State Medical Journal", July, 1930.*

Dr William F. Koch, MD, worked from a Physiologist's point of view and developed theories on how the chemistry of the natural immune system of the body worked. His early research focused on the Parathyroid Glands. The Parathyroid Glands are 4 small glands, each about the size of a grain of rice, located in the neck behind the Thyroid Gland. Their main function is to produce Parathyroid Hormone, which Regulates Calcium and Phosphorus levels in the blood. This is crucial for bone strength, nerve function, and muscle contractions. The Glands Increase blood Calcium levels by absorbing Calcium from food, pulling it from bones, and converting Vitamin D to its active form, which aids absorption in the intestines. Dr Koch concluded that the tetany that occurs after the Parathyroid Glands are removed was due to the accumulation of toxic substances in the body. These Toxic Substances blocked the normal tissue oxidation process. This was a very important discovery in Dr Koch's research, and helped shape his theories on cancer treatment. Dr Koch became widely known for injecting a substance into a cancer patient's bloodstream, known as the Koch Treatment. The substance originally called "Synthetic Anti-Toxin", and later "Glyoxylide." Dr Koch disclosed the formula as: 1 part Gyoxylide to 1 Trillion parts water.

Dr Koch explained how Gyoxylide worked:

> ***"The serum is carried to the cancer by the blood. The cells are killed. Their osmotic pressure increases and they become waterlogged and swell. The pressure of the swelling causes more pain until the killed part has been disintegrated and absorbed, and the absorption, or burning up, causes fever, usually occurring about 12 hours after the injection of the serum. Cancer tissue so absorbed also serves as nourishment. If the patient has been starved a long time because of cancer of the stomach, a large cancer, paradoxical as it is, is a benefit since, once killed, it supplies food elements and***

> ***actually gives strength to the patient. Cancers previously treated with X-ray or radium, however, if killed by the serum treatment, gives products that are very toxic, sufficiently so, in some instances to kill the patient."*** *- Dr Koch, in Detroit, 1919.*

"The Koch method is a systematic course of Dieting, and Enemas combined with administration of Koch Synthetic Antitoxins: Malnide, Glyoxylide, and Parabenzoquinone. The treatment injections were made up of 1 part glyoxylide to 1 trillion parts water. Dr Koch preferred to deliver glyoxylide only once or twice in the form of intramuscular injections (2 cc), in a highly diluted (possible homeopathic) form. Initially called this substance "Synthetic Anti-Toxin"; it later became known as "Glyoxylide." The Treatment was also marketed under the label of the Christian Medical Research League. **Dr Koch stated that the Koch Synthetic Antitoxins stimulate the destruction of the toxins responsible for the growth of cancer tissue.** Dr William F. Koch, MD, **reasoned that cells become cancerous because the blood's Oxygen levels get depleted. If sufficient Oxygen were continually delivered to the body's tissues, cancer pathology would be virtually impossible. This same Treatment plan was also found useful as a cure; for 69 diseases from Appendicitis to Herpes Zoster. Dr Koch stated that his discovery was Also Effective Against Tuberculosis, Psoriasis, Leprosy, Polio, Syphilis, Appendicitis, Herpes Zoster."** - in "Koch Treatment / Koch Synthetic Antitoxins", British Columbia Cancer Agency, February 2000.

Koch Cancer Treatment Antitoxins Therapy

"The first mention of the Koch Antitoxins was made in an article by Dr William F. Koch, MD, in Detroit Medical Journal, July 1919. The Koch Treatment is said to be based on a belief that cancer is a response to a Toxic Product generated within the body, and that this product must be oxidized before recovery is possible. The Koch Method uses a Cleansing Regimen by Diet, combined with the 3 Koch Antitoxins: Glyoxylide, Malonide and Benzo-Quinone (BQ). The chief therapy for cancer recommended by Dr Koch is Glyoxylide, administered by injection in a solution said to contain 1 part of "partially oxidized inositol" to a trillion parts of distilled water. The other 2 Antitoxins, 1:4 Benzoquinone and Malonide, Ketene Solution, are said to be effective in: Allergies, Infections, Cancer. All 3 Act as catalysts to en courage the destruction of the toxins, which he holds responsible for the growth of cancer tissue. They are administered in combination with a Strict Diet, combined with Colon Irrigation." - in "CA: A Cancer Journal for Clinicians, Jul-Aug 1965.

Existence of Molecule Is Confirmed After More Than a Century

"University of Arizona, Scientists have the first definitive evidence for the existence of a molecule called Ethylenedione (OCCO). This discovery solve a mystery that has troubled generations of chemists for over 100 year, but because the molecule is thought to play a role in an array of chemical reactions related to everything from industrial processes to atmospheric chemistry ("Elusive Molecule Made in the Lab", Nature, 23 July 2015). The OCCO molecule was first suggested in 1913, scientists have been trying to confirm its existence, but with little success. **The most controversial attempt occurred during the 1940's, when Dr William Frederick Koch, MD claimed that he'd not only managed to synthesise the much sought after compound, but that It Was the Active Component of Glyoxylide. Dr Koch, MD claimed his discovery could Cure Cancer and Diabetes, The US Food and Drug Administration (FDA) classified the discovery as "fraudulent." We Can Now Confirm That OCCO Is Real, and its simplistic structure is as beautiful as we could have imagined. You probably even learnt how to write it, if you did chemistry in high school: O=C=C=O.**

The unstable nature of the molecule is what made it so hard to find; it splits into 2 carbon monoxide (CO) fragments after half a nanosecond or so of existence. This type of transient molecule is called a diradical." - in "Existence of Elusive Molecule Confirmed After More Than a Century", Science Alert, 14 July 2015.

Koch Cancer Treatment Plan

"Dr George Crile (Crile Clinic Cleveland), gave thorough information to the profession, and the public on this subject and was in exact agreement.

The report of the 12th Annual Scientific Meeting of the Detroit Institute of Cancer Research, the concensus was the same, Dr Harden B. Jones, Professor of Medical Physics at the University of California, gave the ultimatum:

> *"The odds for or against the recovery from cancer; are set long before the patient sees a physician, and: There is no evidence that treatment by surgery or radiation, the only recognized methods of therapy affect the course of the really malignant forms of cancer. Early treatment is a nice theory, but there is no evidence that it benefits the patient. Some* ***Drastic Cancer Therapies Not Only Do Not Help But Are Harmful.*** *The tumour easily could have a billion cells before it is large enough to be recognized as cancer. Some of these cells are already in the blood stream."*

Unfortunately Radiation does not answer the needs of the patient, But Adds to the Basic Pathology. The Convention of the American Roengten Ray Society, September 1954, added to the Report of the Roengtenologist of the University of Pennsylvania in 1925, when it stated that:

> ***"Irradiation before and after surgery opened the vascular and lymph spaces and helped the spread of the disease instead of retarding it."***

This Report was so unpopular that it was suppressed, 8 to 10 times more radiologists die of Leukemia than general practitioners.

> ***"It is not possible to discuss the irradiation treatment of cancer in a general way for the reason that the disease differs in its type and characteristics of growth in different parts of the body."*** *- Dr Henry K. Pancoast, Roentgenologist in "Treatment of Cancer by Irradiation Methods", The Surgical Clinics of North America, 1927.*

Prevention of Cancer, Allergy and Infection

This whole text has developed the thesis of prevention and cure of these conditions and some others not classified with exactness.

Removal of All Foci of Infection

The role of suppressed or buried infection in causing chronic diseases has been exposed in detail. It is only logical that such foci should be removed if at all possible. They are Dead Teeth, Infected Teeth Toots, the scarred-in buried tonsil and associated hardened lymph glands, the Infected Appendix that gave an acute attack years earlier, the infected gall bladder. Most of these sources of suffering, and death, can be removed.

Diet and Intestinal Hygiene

The Gastrointestinal Tract; as a source of the toxic amines living in symbiosis with various germs, requires: All the Attention spoken of under Diet, and Intestinal Hygiene. To this end the Enema should be used freely and intelligently to strengthen the bowel wall by washing away the toxins that paralyze it and cause diverticulosis. Special Lavage Systems, are available most everywhere, one can learn to use the Enema at home with good results as well.

Healthy Diet

Correct Eating, as to quality and quantity. The choice of foods calls for the avoidance of selenium containing wheat, etc., and the avoidance of foods poisoned with insecticides. It is within the power of the Food and Drug Administration (FDA), to correct the whole food poisoning situation, and just now public worry over the insecticide and carcinogenic contaminations of the food is calling for some protective action. But this action is even now as stingy as it can be, and no protection against the selenium contaminations are offered as yet. If such neglect continues, it will be necessary for those who are able to organize their own farming services and see to it that the ground is fertilized scientifically by the organic procedure so the plants are correctly nourished and healthy and resistant to insect attack.

In fact, it is demonstrated that insects attack the sickly plants rather than good healthy stock. Selenium-free soil will be used, and crops rotated wisely.

Whole Rye is the superior grain, and the whole grain should be used, washed, dried and ground fine for baking. Freshly ground grain is preferred.

Honey should be used instead of sugar, and Extra Virgin Olive Oil in preference to any other fats. Foods should Not Be Fried (No Vegetable Oils).

Suitable Movement and Exercise

Sufficient exercise to meet the personal needs must be taken and especially such Exercises as Massage the abdominal contents. Each day the muscles need to be fatigued a little.

Rest and Mental Relaxation

Plenty of sleep, free from worries or fears, a clear conscience, forgetting oneself with a healthy interest in the welfare of others so that constructive attitudes dominate, have their good effects on the circulation, and Prevent the Harmful Mental Influences From Dominating the Body Chemistry.

This is particularly true with reference to the harmful Secretion of Adrenaline, Adreno-chrome, etc., that are Thrown into the Circulation by Anguish, Anxiety, Fear, and Insecurity. (Body and Muscle Relaxation, these make for so that there are better Eliminations, and a better coordination between Sympathetic and Cerebrospinal Systems).

Intestinal Lavage

Many amines possess high reduction potentials, and can inactivate the Functional Carbonyl Group of the tissue cells, laying them open to other pathogens, just as the Toxic Amines Absorbed from the Toxic Intestine can do.

In this respect **Toxic Amines were found in recent Psychiatric research to Disturb Brain Function. The stabilizing influence of religion is seen in our ancestors.** They had courage, were not subject to jitters, **and Never Took Calming Dopes, and had much Less Cancer than our generation.**

The Mental Influence Over the Reflexes that Govern Digestion and Intestinal Movements is to be considered here. Spastic bowels with dry walls, the failure to empty the rapidly increasing bacterial poisons, add to the mental instability that brings these conditions about. Calm joy serves otherwise.

In the prevention of cancer it is important to consider the structure and behaviour of the lower end of the large bowel, namely the descending colon, the sigmoid sphyncter, and the sigmoid cavity that ends with the inner anal sphyncter, the short rectal canal and the external anal sphyncter muscle.

Much cancer of the bowel is located in this region, and much intoxication is developed in the sigmoid cavity that poisons the body generally and gives rise to cancer in other parts that are disposed to anoxic effects.

Cancer of the bowel, the sigmoid flexure and cavity particularly, come in people who neglect the emptying of the bowel once or more times a day, and particularly the emptying of the sigmoid cavity with completeness at each movement. The victims are generally nervous people Who Suppress The Act of Defecation; to meet some other activity. Here the Bacteria have their Chance to Continually Reinfect all material that is admitted, and keep the Intoxication going at its highest rate. The Bowel wall gets Poisoned, so it cannot produce the energy necessary to make the muscle fibers contract. The pressure developed inside by accumulation and gas production causes the wall to dilate and form sacs or diverticulae that hold the feces indefinitely, poisoning the wall more and making it dilate still more, in a vicious circle. Obviously: The Obligation Is To Wash Out the Accumulated Feces, and keep on Washing them out twice a day, or oftener depending on the case, but at least to keep the cavity clean and free of the paralyzing poisons. Then the system that has been poisoned generally from the fecal toxins needs a boost in its oxidation advantage so as to defend any poisoned tissues and particularly the bowel wall itself. **It should be understood, too; that not only the sigmoid is injured by the Constipation, but the whole colon and particularly the ceacum at the beginning of the colon.**

A Constitutional Aid is required to give the wall enough freedom from Functional Carbonyl Group inactivation so it can start to have muscle contractions and abundant secretions again.

The Daily Lavage as often as required will give the bowel a rest as well as Remove the source of poisoning.

The Diet will also help in removing the substances that produce poisons at the hands of the bacteria.

When this procedure is carried on long enough the bowel will regain its normal parastaltic habits and the parastaltic wave will progress forward right through the two sphyncters of the anus, and to the outside. **It is an error to state that Intestinal Lavage carried out scientifically causes a habit that one must depend upon ever after.** Indeed: **The Best Possible Aid to Cure Is To Be Had Via The Lavage System. This will result in the complete emptying of the bowel, as one observes in healthy children. The heart, bowel, and all other tissues, will then benefit and have the advantage of remaining healthy.**

Lymphatic Leukemia with Terminal Exhaustion

The liver and spleen were enlarged and tender. He was put on Fruit Juices and Intestinal Lavage for 2 days. The fever at the time was 39°C. In a week he was sent home with a normal temperature. The spleen and liver were reduced in size, but not yet normal, the bloody patches had changed from a dark purple to a greenish colour and no new ones had formed. They then turned to yellow and finally disappeared, 9 weeks later he returned for a check-up, was able to walk, had gained 5.5 kg.

Acute Bulbar Poliomyelitis

During the past 2 years the weakness of the left leg has not changed very much for the better but persists as a slight incoordination, according to Dr Baldor.

A residual, very slight atrophy and corresponding slight flaccid paralysis of the right rectus anterior with very slight atrophy in muscles of left hand are still retained. This shows that the injury is spinal and more or less permanent.

In checking accounts in this case, the full cerebral recovery plus the timely cure of the respiratory paralysis without the use of an “iron lung”, and the retention of the minor spinal injury in such a virulent case of bulbar paralysis, speak well for the method of treatment. **Had the patient had time for a thorough Intestinal Lavage, and the elimination of Interfering Drugs like Aspirin, even the spinal injury may have been avoided.**

Acute Lytic type Case of Hepatitis

Student, appeared with a history of having drunk water that was under suspicion of being filthy 15 days previously.

He had abdominal pain that was Helped by Intestinal Lavage.

The urine was loaded with bile.

There was deep jaundice and profound drowsiness.

His state was subfebrile, and the blood examination on 5 February 1959, showed Bilirubin 5.83 mgms% (Malory and Evilin).

The Van den Bergh was immediately directly positive, the cefalin-Cholesterol positive, **the Thimol Turbidity 5 units, and the Thimol Flocculation positive.**

On 7 February the jaundice had faded considerably and he felt very much better, no more pain or other disturbance.

The bile stained tissues had not completely unloaded until 3 weeks later when the Bilirubin test was almost to normal, namely 0.86 mgms%, and the Van den Bergh and other tests were normal.

On 10 March he was fully recovered and back to school.

Here again we see the restoration of liver cell function, which means the rupture of the viral host cell integration, and the restoration of the host cell to functional structure, required 48 hours.

Advanced Bronchiectasis With Asthma

A woman of 31 years of age, weighed 37 kg and was in a severe state of Asthma and Coughing. The condition had persisted for many days and prevented sleep, and correct nutrition, and brought her to the point of collapse. She raised enormous amounts of pus laden sputum for many years, but the Asthma had persisted only for the past 3 years. A severe sinus infection was probably the initiatory factor. Occasionally during the observation visits she was given a lavage of the nasal sinuses to aid their elimination.

Colon Lavage Was Part of the General Care, Together with Vitamins, and the Vegetarian Diet upon which we insist in all of the cases under treatment.

No honest physician or expert in this dire disease will claim that an occasional nasal lavage would cure a deeply established bronchiectasis when indeed they admit the only cure is removal of the lung or the lobe that is affected. Even such cases relapse, it is found, as the fundamental tissue weakness still remains.

Only the Proper Restoration of the Oxidation Catalysis can Restore the Tissue Vitality.

Percentages and Causes of Failure

In the acute infections, especially the severe type, there is no diet problem, as the patient is not able to take food and has generally vomited what he had.

Intestinal Lavage tends to the rest, and the injection is given in greater concentration. The recoveries have been quick with clean tissue repair.

Even after the best antibiotics have failed, and the nurse advises the doctor his patient will not live till morning, **an ampoule of the Survival Reagent has changed the trend immediately to recovery,** and in a few days the double pneumonia is a thing of the past. The etiological factor is out of the way before the patient is tempted to violate the regime. **Where the eating and drinking habits of the past rule the mind,** recovery may go on so long as the patient is under control, but when he is well enough to go free, **he falls into the way of life that led to his illness. In Cancer cases the etiological factor is not gotten out of the way entirely, until the growth is completely absorbed and the focus of infection that gave rise to the toxin is cleaned out and absorbed by a late reaction.**

Even then some old scars as from an early syphilis may still hold malignant cells that happened to drop in that way, and a still later reaction **may be needed to clean these foci out,** although they generally clear up before the original focus of infection has been cleared away. **Breaking the regime before one is fully cured, and the cure is "seasoned",** permits carbonyl group antagonists to develop and possibly wipe out the defense. **Amines produced from meat in the colon, the harmful nitrogenous or sulphides developed in the intestinal tract by bacterial action, these all hinder or wipe out carbonyl activity and block the activating power of the conjugated double bond systems. Patients are usually grateful that there is a regime worked out that helps them get well, but all are not, and perhaps 30% will desert the regime as soon as they think they are well, which is always too early, and then there may be a slow reversal from the recovery status. Perhaps 30% of our patients waste their chance to get well because of gluttony.**

Others have been ruined by irradiation and while they may improve so they think they are well even for as long as ten years, they are not truly cured and never can be. Ultimately an irradiation anemia will conquer the corrected chemistry.

In other cases, where extensive explorations or exposure of the abdomen to seeding of the malignant cells during a corrective operation, the healing following absorption of the neoplastic tissue may cause widespread adhesions which on contraction compress the viscera and prevent their function. Gall bladder and intestinal obstruction may thus take place, or the pylorus may heal shut. At times the adhesions are so dense it is impossible to correct the situation surgically.

Embolism is an occasional cause of defeat in rapidly recovering cases.

Thus, in some series of cases of far advanced type only 46% are reported cured by experts with this treatment. In some series where most cases are not in the terminal stage, and one would look for a high percent of recovery, only 72% have recovered. **And among the failures, some were not caused by giving up the regime too soon.** Something in the system destroyed the reagent, so it had no effect.

Importance of Divalent and Monovalent Cation Balance

The parathyroidectomy experiments emphasized another matter of the greatest clinical importance. It is the relation of the balance of divalent and monovalent cations to cell irritability. Ordinarily the normal cell presents a disposition of the cations, adsorbed and unadsorbed by the cell colloids, so that a water in lipoid phase is maintained. The lipoids thus diffuse to the perifery of the cell forming a concentration of lipoid there that serves as a limiting membrane, and tends to shut out water soluble materials, while water and its soluble materials tend to concentrate in the center. The effect is reversed by an excess of monovalent cations and accentuated by divalent cations. The monovalent cations thus tend to cause a lipoid in water phase with the lipoids concentrated at the center and the water soluble materials and water at the periphery. This tends to increase the entrance of water soluble substances into the cell.

The Importance of Diet, Calcium Carbonate, Sea Salt and Magnesium

Sodium and Potassium thus tend to increase the cell's exchanges, and the entrance of water soluble toxins. **Calcium and Magnesium tend to reverse this situation. Calcium is important with Magnesium in lessening the cell irritability**, while Sodium and Potassium increase it. Variations play their roles in functional activities of all cells and will be apparent also in the functions of heart muscle. After parathyroidectomy, the increase in irritability of the nervous system followed the loss of calcium from the tissues. The entrance of guanidin toxins gave convulsions of greater severity the more the Calcium that was lost. Calcium transfusions reduced the convulsions for a time, that is so long as the kidney function was maintained. Other solutions as of Potassium and Sodium, and even distilled water did the same for a time, so diluting the blood and washing the toxic element out via the kidneys, showed that Calcium metabolism was not the whole problem after parathyroidectomy. A complicating factor is the normal place of Calcium in activating ATP-ase (group of enzymes that hydrolyze Adenosine

Triphosphate (ATP) to release energy, which it uses to drive other cellular processes like active transport and muscle contraction, these enzymes are essential for all known life and have critical roles in cellular functions, from generating and consuming energy to moving ions and molecules across membranes), for the transfer of energy into the working mechanism of the cell. Here is a chance for energy transfer also to the surfaces of the tissue colloids that aids their dispersion and **Oxygen Transport, to Get Rid of Toxic Materials** and preserve a better colloidal structure in the cell throughout its contents. **Normal cell excitability and response to stimulus is thus maintained by this other function of Calcium.** When one sees exaggerated reflexes, or persistent excitability of a tissue one therefore thinks of the dispersions of the lipoids to or from the cell surface and also the disposition of the monovalent and divalent cations. In cases of high irritability, one would not give transfusions of solutions that would increase the monovalent salt content. Isotonic Salt solutions made with sodium chloride would not be used unless the sodium is balanced by calcium and some sort of a Ringer's solution would be used. Even the sera of the blood banks could be taken from individuals with high sodium chloride blood content. These matters deserve consideration. **Our Diet calls for Calcium in Plentiful Amount, as Crude Calcium Carbonate. We also give the potentized Calcium as carbonate to cancer patients.** This is to diminish the nutrition of the sodium rich cancer cells, and to reduce the pain caused by the ever present incompletely combusted metabolites that enter the nerve endings in the affected areas. **Calcium, and Good Intestinal Lavage, and A Well Chosen Diet Go a Long ways in abolishing the pain in cancer.** Likewise the carbonyl reagents tend to burn the incompletely combusted metabolites out of the way so they cause no more pain. The cancer cells also under good Calcium supply do not tend to swell up so much and cause so much pressure, for the reasons just mentioned. **All of these factors enter the Treatment of the Neuroses and Psychotic States.** An illustration of the parallel run of toxins with failure of the use of Calcium is seen in the treatment of dairy cattle that were badly diseased by hemolytic staph, aureus infections of the mammary glands. After the carbonyl (SSR) therapy was used, both the hemolysins disappeared, and the Calcium content of the blood and milk increased. The lactiferous cells were able to use the Calcium for cell building and for milk production, and the germ no longer produced the hemolysins. This work was done at the University of British Columbia and by the scientists of the Ministry of Agriculture. **Thus; The Toxic Inhibition of the use of Calcium Must be Removed to obtain its full biological effect."** - Professor Dr William Frederick Koch, MD, in "The Survival Factor In Neoplastic Diseases", 1961.

The Inroads Arising of Septic Poisons

The Emunctology Treatment its Aimed at Preventing and Resolving:

1. The inroads of the arising of Septic Poisons from the continual flow of pus, that affects the Emunctory, and Lymph Circulation, and causes an Improper Coordination of the Eliminating Forces of the System, the Emunctory System.

2. The Skin: If Toxaemia, would not be thrown off in the Epidermis "Skin" (through the Lymph and Capillary Circulation), the Intestinal Tract would be full of Pinholes (can develop in a diverticulum or peritonitis);

3. The Lungs (Purification of the Blood Supply): Or, were it to go to the Lungs, there would be Tuberculosis;

4. The Heart: Were it to go to the Valves of the Heart, it would be Heart Trouble (as the Medical Trade would call it);

5. The Liver: Were it to go to the Liver, it would be Cirrhosis of the Liver;

6. The Spleen: Were it to go to the Spleen, it would be a Hardening of one end of it;

7. The Brain: Were it to go to the Brain, it would be Softening of the Brain (these cause disturbances in the physical forces of the body, such as senility, that is, impulse in the gray matter in nerve force be lacking, thus gradually, unless measures are taken, there must come the softening of the brain cells, so that the reflexes will gradually become less and less active, for the flow of blood as well as impulse in the circulation through the central portion of brain cell, from the lyden "leydig" glands and the activity of the organs in the pelvic area);

8. The Glands: Were it to go to the Glands of the Throat or Thyroids, it would become Goitre; were it to settle in some other portion, were it to Settle, it would become a Tumour of some character or nature.

Intestinal Toxaemia in its Relation to Cancer

"Intestinal Toxaemia, in its relation to diseases, not excepting malignancy.

Intestinal Toxaemia is no new subject.

For the past hundred years an enormous amount of work has been expended upon it, both medically and surgically, in an effort to counter its ill effects, and even back to the early days of our profession we find treatment and drugs which had as their object, **their one and main object: The Cleansing of the Bowel.**

But as the importance of this condition is being recognized, and as further work is being done, so we are better able to understand the details of its nature and the more exact conditions by which it obtains its deleterious results.

The powerful and far-reaching effects of Intestinal Toxaemia are as yet only beginning to be understood. **Its wholesale ravages upon civilization, ravages the more difficult to understand because of its insidious nature.**

The sure, steady lowering of resistance, and the predisposition to disease, and the benefits that accrue from its removal, in the vast majority of all diseases, is yet to be appreciated by the profession.

The primary cause of this abnormality is essentially Diet, and secondly, infection, **which is able to take place only through Incorrect Food, and how important a part these play in most diseases and that the predisposing causes of Cancer are no exception.** Food is the fuel of the human engine, supplying the need of every minute cell of that most wonderful of all machines, the human body. But, if the fuel is deficient in its necessary characters, it not only becomes a source of diminished energy, but allows another host of possibilities in the production of poisons and deleterious substances fatal to the perfect working of the individual.

There cannot be the least doubt that civilized Diet is radically incorrect, it being out of all reason to suppose that our present methods of cooking, and **general treatment of food are in any way compatible with the laws of nature.**

1. **Intestinal Toxaemia owes its origin to Errors in Diet.**
2. **To Infection; which can only occur when the conditions of the gut are abnormal.**

This condition is present in almost all, if not every individual living on such a Diet. Its presence may not give rise to symptoms for months, years, or until old age, as disease depends considerably on the individual to resist poisons, though to a certain extent on the variety of the organisms connected with the Toxaemia.

Abnormal Diet may begin at birth, as in the case of artificial feeding, more commonly at the end of the first few months.

Considered from a natural history point of view, **the human species was undoubtedly intended to live on the fruits and products of a vegetable nature of the tropics**, and possibly on the flesh of the smaller animals, but whether man was intended to be a vegetarian or a carnivore **one thing is certain, that our present cooking, storage, and tampering with food were not allowed for in the universal order of things.**

Thus we shall see later, **an abnormal content in the bowel begins with us early, and persists throughout life.**

It is possible that given the Normal Diet from birth abnormal organisms in the intestines would probably fail to become permanent residents although they are so universally present.

An enormous number of chronic diseases can be treated successfully on these lines. That 25% of all cases of definitely advanced inoperable Cancer treated by these methods show a temporary improvement and relief of symptoms, and generally have a more comfortable time.

If 25% of advanced cases of Cancer show even the least sign of benefit, and it is possible to claim more than that.

The Deficiencies in Natural Food:

1. Absence in Essential Products Necessary to Health, such as: Vitamins, and Minerals, etc... .

The deficiency of vitamins and substances necessary to health is so accepted and has been so proven, bearing in mind the outstanding cases such as rickets and scurvy, and yet when more research has been done it will probably be shown that **minor deficiencies extending over a long period of time have a serious effect on the general metabolism.**

2. The lack of substances necessary for the bacterial content of the intestines to ensure cleanliness.

For the intestines to be kept clean, certain organisms are necessary, and these can only exist when provided with proper food. The cleansing bacteria of the gut are the lactic acid bacilli, as from the acids they produce they prevent putrefaction, and cause a healthy and comparatively sterile excreta.

3. The presence of substances from which toxins can be readily made.

There is present an excess of flesh protein from which poisons of a toxic nature can be so readily produced. The comparison between the faeces of those living on an average diet and of those taking a large amount of raw material has been very interesting and very striking.

The average colour is darkish brown, whereas it should be pale brown.

The average smell is what is described as fecal, whereas there should be no odour, or at the most a slight smell as of sour milk.

Chemically, most of the putrefactive bodies such as Skatol, and Indol are absent, and finally, the bacterial content differs enormously in the two.

The ordinary specimens being composed mostly of B. coli, streptococci, spore-bearing bacilli and abnormal bacteria, whereas the only organisms found in a healthy stool are the Lactic Acid Bacilli and B. Coli.

This great contrast alone should be sufficient to convince anyone of the advantages of correct diet, and the benefit the individual must obtain from the absence of all the usual putrefactive material.

In the healthy intestines that I have described abnormal bacteria can only exist with difficulty, and are unable to produce their toxins readily.

The natural scavenging organism of the intestine, the lactic acid bacilli, practically dies out when the fecal content is [over] alkaline. [Note that the body should not be ever, neither over-acidic nor over-alkaline. The normal pH range for human blood is between 7.35 and 7.45. This Slightly Alkaline or Basic pH Is Crucial For Many Biological Processes, including blood Oxygenation]. We now come to those abnormal bacteria which are mostly responsible for Toxemia.

They are bacilli of the Gram-negative type, which do not ferment lactose.

A large number of varieties of them have been worked out in detail, but the number of the different forms is so enormous that it is impossible to classify them all, and it is sufficient for the present to put them into groups.

These Organisms Are Not Pathogenic, in the ordinary sense of the word, in that they do not produce disease, although they may occasionally be responsible for local conditions in the intestines, but their danger lies in their prolonged, continued action, and the Toxins which they are slowly producing throughout life, gradually and insidiously lowering the vitality of the individual, and giving increased susceptibility to both acute and chronic disease. According to the virulence of the Toxaemia, and possibly equally important according to the resistance of the host, so depend the number of years necessary before symptoms are developed.

In most cases the human subject becomes infected early in life, and so commonly are these organisms found, not only in the adult, but also in the child, that they might be considered, as they even are in some laboratories, as more or less normal inhabitants, were it not for the dramatic results obtained in the treatment of chronic disease by their removal.

Treatment consists of 2 distinct parts, with the object in view of removing the Intestinal Toxaemia:

1. The Diet should be so arranged as to contain the least possible amount of material from which toxins can be manufactured, and most suitable for the growth of scavenging bacteria and inhibition of abnormal organisms.

2. To remove the toxin-producing bacteria from the patient.

The Diet consists in removing all forms of cooked flesh, as it is from this poisons are so readily produced, and keeping the patient almost completely on a vegetable, fruit, nut and cereal diet. This alone enormously reduces the amount of toxins produced in the intestines; also, if continued for a long period, ultimately tends to remove pathogenic bacteria. **I have given you an outline of the conditions of a Toxic Intestine. The difference of the average excreta and the clean wholesome faces of a natural diet, without putrefaction or odour, obviously must have an enormous influence on the individual, also the completely different flora which is to be found. The removal of this condition allows the body to fight in a most efficient and surprising way even advanced disease itself.** The tubercle bacillus is mostly accepted as the cause of consumption, yet how little has the discovery of that germ helped to fight the disease, except by guarding from infection. **The tubercle bacillus itself is unable to become dangerous except under the conditions of a lowered vitality, and in most cases of Consumption (Tuberculosis) much benefit is obtained, even after the disease is well established, by the removal of the underlying Toxaemia. So as in consumption, this applies to a large number of the chronic diseases, the general treatment being to improve the condition of the patient, and the individual will then cure himself of the local condition, and one of the surest methods of raising resistance and causing a general improvement is by Cleansing the Intestines (Colon Irrigation), and relieving the body of the poisons so usually generated therein.** It will interest you to know that from experiments that have been done many remedies of a more deeply acting nature have a profound effect on these abnormal bacteria, and it has been demonstrated that their action is similar in every way to the result of an injection of vaccine.

Malignant Disease

There is a growing tendency throughout the laboratories of the world to suspect Diet as a predisposing cause to Cancer; many various modifications of food have been tried, in some cases with distinctly favourable results; my own experience during the last 8 years, on those cases which I have had the opportunity of treating, is that without claiming a single cure, **25% of advanced, and mostly very advanced, cases received temporary and definite benefit.**

And if the removal of Intestinal Toxaemia can so improve even the most advanced cases, how much more should its absence throughout life completely prevent the occurrence of this dread disease? Most of the cases with which I have dealt have been in the last stages. I will now give you a few examples of some of the best results that have been obtained; nothing miraculous, but you must remember that **they were all terminal cases, and that the consistency of the results has been far too steady to make any chance of coincidence possible.**

Case 1 - Mrs F.C., aged 37. March 1923. Had breast removed 2 years previously. Present condition, growth in both lungs and liver. Effusion in both pleura. Sternum markedly bulging; continuous vomiting: pulse 130; respirations 32. First dose, March 16: Marked benefit after 24 hours. **General improvement continued for 3 weeks. Second dose, April 5: More marked improvement; patient able to get up. Improvement continued, and after a few weeks patient leading an almost normal life.** Respirations and pulse becoming normal; and the fluid diminished. No increase in size of growth. Third dose, June 15: Steady improvement through June, July, August and September. Patient did moderately well till the middle of December; she was taken suddenly ill December 27 and died on the 28th.

Case 2 - Mr J.B., aged 63. Solicitor. Carcinoma of gall-bladder and liver. December 1919, patient in great pain and distress. Huge mass of liver. Morphia necessary for pain. First dose, December: Relief of pain within 48 hours. General improvement followed during the next 3 weeks. At the end of a month patient up and about, and resumed his duties which he continued until July. **During this time the growth slightly diminished in size; but the pain and distress entirely disappeared.** Two further doses were given. In August the patient was suddenly taken ill with apparent heart failure, and died within 3 weeks.

Case 3 - Mr W.S., aged 72. Carcinoma of the tongue. Tongue had been removed and an extensive growth in the floor of the mouth and the glands of the neck. Considerable pain and frequent small heemorrhage from the mouth. First dose, November 7: **The pain and hemorrhage both ceased 24 hours after the dose. The growth became cleaner. Other doses were given on 14 December, 29 January, and 18 February. There was no further pain nor hemorrhage. The growth remained stationary** until February, when it started to enlarge slightly. Patient died suddenly on 1 March.

Case 4 - Mrs M.R., aged 66. Advanced Carcinoma of the Cervix. Considerable hamorrhage and some pain. First dose, October 25: **Hemorrhage and pain ceased until December. Second dose, December 9: General condition improved.** Slight hemorrhage January 15. Third dose given: **General improvement up to May.** Not quite so well. Fourth dose, June 5: P**atient still alive and slightly better.**

Case 5 - Mrs E.M., aged 62. Advanced Carcinoma of the Cervix. Confined to bed. Considerable pain and distress. First dose, 15 February: **Considerable improvement. After a week patient was able to be about. Second dose given in March and the third in June. Patient's condition is still very fair, and she is able to be about and assist in the doing of ward-work.**

It would be possible to continue citing such cases indefinitely, and such are the average results of those cases which respond well: diminished pain, frequently completely absent, and an improvement of all symptoms, with a more or less shrinkage in the growth, the patient being rendered more comfortable, and the end when it comes generally being sudden or after a short relapse.

The Fundamental Points Are:

1. That civilized Diet is unnatural, deficient in necessary properties for health, and also to ensure the Intestines being able to be kept in a Clean state.

2. That the conditions which arise in the Bowel as a result of this allow an Abnormal Flora, an absence of the purifying organisms, and the presence of Toxin-Producing Bacteria, with the result that the faeces are objectionable and dangerous.

3. That removal of this condition, and Cleansing of the Gut, causes a most remarkable improvement in the general health, and usually also in most chronic diseases, without any local treatment.

4. Intestinal Poisoning is no longer the vague apparition of the past, when Stasis alone was supposed to be the main cause. We now know the necessary diet to eliminate the foods from which toxins are most readily formed, the bacteria concerned in its production and the toxins themselves can be isolated.

Toxaemia depends not so much on Stasis, as the Content of the Gut; if no poisons be present, even when Stasis exists, naturally there can be no absorption; but if the Faeces are foul, no matter how rapidly they pass, there will be a certain amount of absorption into the Bloodstream.

Usually When The Condition of The Intestinal Content Becomes Clean, There Is Such An Improvement in Muscular Tone, and General Health that Constipation Ceases." - Dr Edward Bach MD, in "British Homeopathic Journal", October 1924.

"During the frenzy of one of the Cancer Week scare campaigns, someone asked the question: "Is there not some danger in developing "cancerphobia" in the public mind by this scare-head publicity?" Dr John Cerster, chairman of the New York Committee of the Society for Control of Cancer, replied:
"It would be a good thing if it did; anything that would scare the people into going to a physician for an examination would be beneficial."
The Financial Benefit to the Medical Trade is apparent but the benefit to the people is in reverse ratio to the amount of diagnosis and treatment given.
This is obvious since the cancer rate has quadrupled within the past 10 years.
Dr G. Earl Thomas has charged that:
"Cancer is the most profitable disease that the members of the America Medical Association Have."
One of the noted American cancer authorities, Dr L. Duncan Bulkley, senior surgeon of the New York Skin and Cancer Hospital, denounced the popular medical claim that cancer is a "surgical disease" when he stated:
"Cancer is not a surgical disease. Neither surgery, not X-ray nor radium have changed, in anyway whatever, the ultimate mortality of cancer in 40 years. It was 90% in 1884. Now it is 92%". *- in "The Poisoned Needle", Suppressed Facts About Vaccination", 1957.*

What Fulfilment Will Emunctology Bring to the Practitioner

For the Improvement of the Physical Body, each individual should be Mindful of its Diet, as well, as for the periodical need of the application of Hydropathy, the effects of water, and its beneficial effects upon the physical body. The Emunctologist, with the vibratory forces of manipulations, or of Neuropathy in its effect, so may the body direct for Self, those same conditions that are beneficial. Emunctology as a vocation offers a channel through which the body, mental and physical; may find self-expression in aiding many, in that as a Teacher, whose lines are those in keeping with development of Body and of Mind. Knowing this is not All, but a Channel that may be used for individual application of those necessary elements in individual forces.

The Therapeutic Value of Neuropathy

Neuropathy correctly applied will bring Much improved in the General condition of any body, aiding, giving strength to the coordinating influences in the mental, and physical forces of any physical body. Thus, the Neuropathic Treatments, aid, by helping in restoring the proper coordination's.

The Neuropathic Treatments, these followed the correct vibrations as related to the low electrical applications. For example, the more Extensive applications for the vibrations, that may be carried by the Massage or the Neuropathy, or Neuropathic Applications to the body; also applying the corrections in those centers in the lower portion of a body, that is, through the lumbar-sacral-coccyx area, make for the better absorption in the body. The Neuropathic Massage of a body from the centers of the 4th lumbar plexus, and the limbs, produce a stimulation to the superficial circulation, these will aid in reducing tiredness, and enable the body to move. The Neuropathic Treatments, help to expand and relax the body, rather than corrections through vertebral forces or of the taxation of muscular tissue. Rather the nerve end With tissue needs following out.

Thus Neuropathic Treatments are more gentle, than those of Osteopathic Manipulations, for each have their Correct Application, as does the Chiropractic Adjustments.

> ***"The Basis of Manual Therapy, according to Dr John P. Arnold, MD, can be looked for in the Vasomotor Mechanism. This Should Be Thoroughly Understood by the Physician."*** *- in "JAMA", 6 June 1903.*

Thus, Neuropathy is, and needs to be, in itself understood by the Physician who gives these Neuropathic Treatments, that Neuropathy is that which aims to help the body forces, to rebalance, re-align, thus aiding those forces, by giving strength, bringing force to the Nervous System. Often there is the need for 15 to 20 of such Adjustments and Manipulations. After these Properties, Treatments have been taken by the system, these Neuropathic Treatments should correct any body to its full development, in that coming about in each body.

For it is Only then, Does the Emunctologist Becomes: Optimum Therapeutae

Healthful Routine of Living

"The Healthful Routine of Living Includes:

1. Ample Sleep: Younger children should have midday rest periods as well as ample sleep at night.

2. Plenty of Outdoor Air and Sunshine: As far as possible, play should be out of doors The More Fresh Air, The Healthier The Child. It is possible to have fresh air inside the home, but more difficult to get plenty of sunshine too.

3. Proper Food: This includes a well-planned Diet; plenty of milk and other fluids; sparing use of sweets.

4. Careful Attention to Elimination: It is apparently true that the individual with Poor Elimination (constipation) has less resistance to disease.

5. Development of Habits of Personal Cleanliness, such as frequent washing of hands, brushing of teeth, cleansing of mouth and nose." - in "Health Through Prevention and Control of Disease", 1926.

Health is Balance

> ***"Balance of all aspects of your being: Physical, Mental, Spiritual. The daring is yours, the work is yours, the determination is yours, but God is with those who help themselves; the Lord is with you. There are fundamental causes of illness in the spiritual and emotional realm, and causes in the physical realm. They are interwoven, and one has to diligently undo the many knots, one by one to bring back balance. Balance Is the Key Word of Nature; Balance Is the Key Word of Health."*** *- in* ***"God Helps Those that Help Themselves"****, 1894.*

The Part Taken By Nature and Time in the Cure of Diseases

"1. All vitalized matter; is the subject of a law of development peculiar to its class.

2. Vital organizations are not active "per se", but are endowed with a capability of activity under stimulation.

3. Normal Stimulants Produce Physiologal Activity: Health; Abnormal Stimulants Produce Pathological activity: Disease.

4. Human maladies are always the result of abnormal stimulants acting on the histological elements of the body.

5. Disease in any part continue as long as the pathological stimulant is operative; when this ceases, the part returns to its physiological state.

6. To Cure Disease It Is Only Necessary to Remove the Stimulant Exciting It.

7. The duty of the physician is to watch nature and assist her as opportunity may offer.

8. All perturbating medicines are themselves pathological stimulants.

9. The popular professional estimate of the medical virtues of drugs rests, mainly, on the vicious logic of post "after this, therefore, because of this".

10. That this estimate is erroneous, is proven by:

A. Curable diseases are recovered from in the absence of all kinds of drugs.

B. Curable diseases are recovered from under the most diverse treatment.

C. The state of the patient's mind makes the operation of even pure drugs uncertain.

11. A recognition of the doctrine of the "vis medicatrix naturæ" (the healing power of nature), must underlie all rational therapeutics.

12. The principle involved in this phrase has been recognized and deferred to, since the earliest historical era of medicine, and is likely to be immortal.

13. It derogates nothing from the physician, or the agents he uses, that nature is predominant, and Art Bringing Help, Aid, or Assistance." - Dr James F. Hibberd, MD, in "The Part Taken By Nature and Time in the Cure of Diseases", Massachussetts Medical Society, 1868.

Patterns of Social Adjustment and the Epidemiology of Disease

"Understanding of how Man's Interaction with Social Forces in his Environment Determine his Health and Welfare and are therefore relevant to Healthcare practice. It illustrates the importance of understanding the patient as a person before the diagnosis and treatment can be effective.

"Patterns of Social Adjustment and the Epidemiology of Disease."

"Pathophysiological Patterns and Disease as Adaptive Behaviour."

"Patterns of Disability." This book is for students who cultivate an understanding of human ecology and the relevance of changing social patterns to disease. **"Talking With The Patient", provides guidance in the technics of interviewing and illustrates that effective diagnosis and therapy often requires the physician to understand his patient as a person. The need to be needed, to have a place in the scheme of things is fundamental to the human spirit.**

"The Care of the Patient Begins With Caring for the Patient." *- Francis Peabody*

Man's Needs and Expectations

The course of history has changed as man, always striving to satisfy his needs of Body and Spirit, has perceived them differently from time to time.

Man's interactions with all aspects of his environment including social forces determine his health and welfare. The study of the lofty aspects of man's spirit ought to prove as interesting and as fruitful as the study of his more earthy qualities. It is necessary to help one another. It may be that the positive nourishment of the spirit of man may contain an important key to his health and growth. It may be, indeed, that we will find that altruism is a hard, practical asset, just as cooperation turned out to be. Altruism may provide third dimension to evolution and accelerate even further man's quest for his goals.

When it was learned that cooperation had more survival value than competition, a really startling contribution to progress had been made. It may be that generosity of spirit has even more power. There is certainly widespread evidence that a primary concern for the welfare of others leads to great comfort and satisfaction for the party of the first part. Isn't this what happens when an organization has superb morale? Or in the many human situations where superior teamwork wins? There is ample evidence that the nourishment of the spirit is relevant to bodily health and performance.

In the famous Hawthorn experiment, when the company officials wanted to find out whether fluorescent lighting would increase the efficiency of the working girls, they installed it in one of the workrooms.

The productivity of the group working in that room soon exceeded the productivity of all the other groups. Then it was suggested that the girls might do even better if the walls were painted a pastel shade. That worked, too.

Really interested by now, the management decided to test the effect of increasing the height of the workbenches by 6 inches. Again productivity increased, but then it was discovered that lowering the workbenches by 6 inches had the same effect. Ultimately, **it became clear to the officials that what was helping these workers toward better achievement was the evidence that someone was interested in their welfare and comfort. From a vast number of experiences, man has shown that his health and well-being depend not only on his capacity to adapt to the tangible environment, but also to prevailing attitudes and values in his society and to his own goals and aspirations.**

Today, when the emphasis is on human ecology and the pertinence of **changing Social Paters to Disease**, all the more aware of cultivating a world perspective. It may be trite to point out that **adaptability to challenge and to change is virtually synonymous with health. Thus a strong sense of group identity, a feeling of being needed and valued is an important requirement of individuals in a healthy society. Interdependence is a very Fundamental Principle among living things. Sleeping - Sleep is as essential to the adjustment of the organism to his surroundings, as eating is to survival. The Amount of Sleep Required, and the timing of the sleeping — waking cycle may vary widely from person to person, but Everyone Must Sleep and probably no one can last more than 200 Hours Without Sleep, without Suffering Damage."** - in "Behavioral Science in Clinical Medicine", 1976.

> ***"Total, prolonged sleep deprivation, can be fatal. The study "Sleep deprivation in the rat", Sleep, February 1989, showed that a total lack of sleep inevitably leads to death. Harvard Medical School neuroscientists have identified a causal link between sleep deprivation and premature death. In a study on sleep-deprived fruit flies, published in Cell on 4 June 2020, researchers found that death is always preceded by the accumulation of molecules known as Reactive Oxidative Species (ROS) in the Gut. When fruit flies were given antioxidant compounds that neutralize and clear ROS from the gut, sleep-deprived flies remained active and had normal lifespans. Additional experiments in mice confirmed that ROS accumulate in the gut when sleep is insufficient."*** *- in "Sleep, death, and... the gut?", The Harvard Gazette, 4 June 2020.*

On Practical Clinical Observation

"Unlike Pathology, a purely Theoretical Science, Clinical Medicine is Eminently Practical.

She studies each patient individually, rigorously analyzes the symptoms, the material disorders, seeks the link that unites them, applies herself to determining the aetiological and pathogenic conditions, and finally draws from all this set of prognostic, and therapeutic indications.

This result is only possible, however, by taking the Anatomy and Physiology normal as a basis, because knowledge of the Morbid State necessarily depends on that of the normal state, like the therapeutic action of medicinal agents is necessarily subordinated to the prior study of the normal agents which maintain the phenomena of life.

An individual is admitted to the hospital for a severe headache, it is minus the phenomenon he mainly complains about.

Asked about the characteristics of his pain, he replied that it occupies the forehead and also the occiput, that it is violent and causes a sensation of tightness, of constriction, similar to that of a bond or a helmet applied on the head, which finally causes slight nocturnal exacerbations, and is accompanied by insomnia.

Taking into account the location of the pain, the sensation of constriction which accompanies it, the nocturnal exacerbations and the insomnia, the doctor is led to surely diagnose the existence of a uraemic headache, because no other headache pain presents these characteristics, not even syphilitic headache, always better circumscribed and of excessive intensity.

Another patient feels in the legs and sometimes also in arms painful, unbearable sensations of tingling and tingling.

Limited to the extremities, these sensations are symmetrical, are exacerbated under the influence of the heat of the bed; the feet are sweaty and yet cold; sleep is difficult, disturbed by nightmares, terrifying dreams; upon waking up, the patient feels dizzy, nauseated, and has green or white pituits.

This symptomatic picture can only be that of alcohol poisoning, because each of the symptoms reported has its own physiognomy, to the point that just one of them would be enough to establish the diagnosis.

Let's add to this picture, exaggeration of the plantar reflexes, hyperalgesia of the lower limbs, of the abdominal integument, especially the emergence of the nerve threads, and the conviction of Intoxication, no longer by alcohol, but by prolonged use of drinks containing essences, such as vulnéraire, absinthe, etc., will inevitably be essential." - Dr E. Lancereaux, MD, Professor of Medicine, in "Leçons de Clinique Médicale", 1892.

"In wonder all knowledge begins." *- Robert Browning, in "Sartor Resartus", 1837.*

Physiologic Therapeutics

"It should be manifest that all Disease, and all Treatment should be regarded in terms of departure from Correct Function, and All Remedies Should Endeavour to Restore Healthy Function. Drugs are often deleterious otherwise, either by interfering with nutrition, disturbing metabolism or poisoning the nerve or muscle cells. One can not object on these grounds to the regulation of bodily functions known as Physiologic Therapeutics, for only **Obtuse Empiricists Will Do Serious Harm in using agencies which are nature's own. The number of such men diminishes in proportion to the opportunities for receiving instruction in the nature of the processes which occur in the body in health and disease. In Other Words: The only safeguard against harmful treatment of disease is a knowledge of living function in health and disease.** This consideration is particularly pertinent as regards the diseases of the nervous system. **Recent neurological labors have supplanted confusion by precision; and the processes at the root of many nervous perturbations become clearer every day. Auto-Intoxications, the disturbances of the internal secretions, the serious effects of purely psychological attitudes, and the role of the infections.**

Hence, the general insistence upon all the elements of a course of Treatment, which comprised:

1. Rest.
2. Massage.
3. Diet.
4. Exercises.
5. Baths .
6. Electricity.
7. Occupation.
8. Encouragement.

Pharmaceutical Blunderbus

This often succeeded where the Pharmaceutical Blunderbus Had Failed.

For the Pharmaco-Dynamics was applied in the very direction To Do Most Injury to the patient. For Instance:

1. The giving of Bromides to patients whose agitation was in reality due to impaired efficiency of the cerebral cortex.

2. The giving of Strychnine in fatigued states, where cells required rest and not whipping.

3. The producing of sleep by Narcotics, when the need was Oxidation rather than Stupefaction.

4. The Prescribing of so-called Anti-Spasmodics in cases of which the pathogenesis was purely Psychical (mind, psyche, or spirit), and where the Physical results - Are Best Treated When Most Ignored.

Therapeutic Measures Upon Physiological Means

But of the Physiological Means, none in itself was out of harmony with the needs of the organism even in health:

1. **Oxidation - was Stimulated by Baths and Massage;**
2. **Fatigue - was Diminished by Rest;**
3. **Tranquillity of Mind - was given by Abstraction from Cares;**
4. **Intoxication - was Diminished by an Appropriate Diet; etc...**

Only the cause of the disease escaped attack; **the patients were not taught the reason of their illness, nor how to live in the future; hence relapses were frequent. The proper treatment is to remove the cause by prescribing a proper diet, and to teach the patient how to keep well by controlling his food.**

Diet

1. Proportions: Imperfect metabolism creates many neurotic conditions.

Hence the exchanges should be studied in each case. An exacerbation of phobias and emotional agitation is often determined in a Psychasthenic patient by a series of meals. In all patients susceptible to Intoxication, the Saline Element of the Food should be abundant, and Fruit Should Be a Main Part of the Dietary. This also aids in preventing the Constipation which so often aggravates the Neurasthenic Symptoms of these patients, giving rise to lethargy and aboulia. Fibre and cellulose should be abundantly taken also.

2. Purity: In these days of adulteration, the greatest care cannot be taken to obtain food neither coarse nor impure. The Slow Intoxication by Foods Decomposed in Storage Must Be Injurious To Many Patients; and the Addition of Preservatives is to be still more Strongly Deprecated.

Exercise

This is of paramount importance for the rectification of disturbed function.

I need not speak of Fraenckel's exercises for restoring locomotion in tabetics.

These are in reality re-education rather than pure exercise. **I wish to Emphasise The Importance of Persistent Exercises in the Treatment of Paralysis:**

I Need Not Insist Upon the Power of Proper Muscular Exercise in Aiding Metabolism by Promoting Digestion and Elimination, and of its Effect in Aiding the Cardiac "vis a tergo" (a force from behind).

It is most important when depletion and fatigue are greatest, a fact rarely realized in nervous affections, although **in cardiac disease there is so brilliant an example of the benefits of graduated exercise.**

Frequently the neglect of proper exercise is responsible for the failure of treatment otherwise well ordered towards remedying an affection of the nervous system.

Massage

To Remove Catabolic Substances Stagnating in the Lymphatics, Massage Is Perhaps The Most Powerful Means; In This Way It Stimulates Nutrition.

It has a Soothing Effect, perhaps through Stimulating Afferent Nerves.

Its Power of Removing Exudates is accounted for by Directly Hastening the Circulation through the veins and Lymphatics of the part, and the Indirect Effect of this Upon the Arteries Supplying the Part, and Upon the Rest of the Body.

In lower neurone paralysis, it has no direct influence upon the restoration of structure; and it merely compensates for the normal stimulus given by the movements of the limb to the Lymphatic and Venous Circulation.

The squeezing of the muscles in Massage is easier borne, and can be more easily graduated in painful peripheral affections than can active muscular contractions; but: **Gradualness and a Very Fine Touch Are Essentials.**

Baths

No measure has a more beneficial influence than a Bath when prescribed in the proper situation. **The calming influence of the Warm Bath in agitated mental states extends even to the insane. The Cold Bath Is Indicated in certain Neurotic States of which Indolence is a feature; but it should be prescribed with the definite Indication for Removing Lethargy, and should be supplemented by other methods with the same end in view.**

I need not enter into the **Eliminative Effects of Warm Baths**, for they are well known. **The use of the Bath to minimize tension and strain of the muscles in the course of the meningitis of poliomyelitis must not be forgotten**; and the suspension of the body in water, too, greatly facilitates the first feeble movements during recovery from that disease.

[See: "Report of New York Committee, Monograph Series", 1910]

Electricity

Electricity, like other remedies, should be used only with a clear object conformable with its physical properties.

One of the most useful of these objects is the maintaining of life in muscles which would otherwise degenerate on account of injury or disease of peripheral motor neurones which supply them.

Such are cases of poliomyelitis and of trauma of peripheral nerves.

In each of these, the life of the muscles should be maintained by galvanism for perhaps a year, until it is ascertained what cells or fibres are definitively destroyed, and which of them can be restored to function.

I can not speak from experience of **the ability of galvanism to promote nutrition other than by the excitation of contractility; but many authorities believe that its intelligent application fosters regeneration of the tissues.**

[Please see: Poliomyelitis, Virginia Semi-Monthly, 25 August 1910; Monthly Cyclopedia. Nov. 1910].” - Dr Tom Williams, MD, in “Physiological measures in the Therapeutics of Nervous Disease”, The American Journal of Physiologic Therapeutics, January 1911.

Clinical Health Books should not be boring, on the contrary, a real, authentic and truthful Clinical Health Book is: Thought provoking all inspiring and most important, useful! The reader must be able to understand it, and learn from it.

What Can Emunctology Teach

“It Can Certainly Teach:

1. **Honesty**
2. **Restraint**
3. **Application**
4. **Desire and need for Hard Work**
5. **Patience**
6. **Tolerance of Frustration**
7. **Avoidance of Deceit**

It can Teach the Value of Curiosity, Observation, Experiment, and the need for Formulating Testable Hypotheses.

It can teach, a basis for operating on the next day’s adventure with nature.

It can teach the recognition that the perceiving of an order in nature has in itself a moralizing effect. It can emphasize tolerance and willingness to consider the inferences of others, and it can weigh or give weight to the aim of leaving one’s specific scientific discipline better than one found it.” - in “The Place of Value Systems in Medical Education”, 1960.

> ***“Increase of Knowledge Greatly Increases our Power over Disease.”*** *- Dr Alexander Haig, MD, in “Uric Acid as a Factor in the Causation of Disease”, 1897.*

How Emunctology; Can Aid Humanity

Man's Development, is of man's Understanding and applying the Laws of the Universe, and as man applies those, man develops, man brings up the whole generation of man. Individuals we find carry out certain elements and laws, and gradually man becomes capable of applying and using those in the everyday life of man. This, whether applied in Emunctology, in Anatomy Science, in Mechanical Science or what not, is merely the development, or the application as man applies to Universal laws as are ever, and have ever been, existent in the Universe.

Emunctology, as a Precise Field of Health-giving Therapeutics, represents that which it is beyond the reach of any medical science, as seen, save from an unseen source. The Science of Emunctology, among other things; Should Make a Definite Contribution to the Effect of Various Forms of Anaesthesia upon the Brain, and the Nervous System.

As to the use of Electrical Forces, as to the Application of those forms of Anaesthesia, and especially to that of the Mental and Brain reactions.

Each Emunctologist, should aim always, in their contributions, to aiding individuals to Adjust their Bodies, and their Minds to Creative Influences in their own experience, From the Physical as well as Spiritual Angle.

The power of suggestion, in the knowledge of the influence of environments, and of reactions to the various impressions received in the reaction of impulses in the physical body.

If one wants to learn Emunctology, one needs to Study also the History of Clinical Health Care, and Nutrition.

The Study of the Digestive System, Glandular Systems, Circulatory System, and all the anatomical systems, in their relationships to the human body.

There is to be considered ever the Whole Activity; not as separating them one from another, but the whole anatomical structure must be considered Ever as a Whole. The Crown Research of Any Emunctologist; Is the Study for 36 months, of the Condition, that Disturbance called Epilepsy.

The Most Important thing of All: One needs to select, and choose ones Source of Information, seriously and carefully. For if the source is of ill, or wrong advise, being one based on ignorance, one will not be a Doctor of Health in Emunctology, but a Doctor of Poisons and Toxins in Medicine. Thus it should be the task of The General Emunctology Council, through its work, to give much to the world. Knowing that The General Emunctology Council, is and always will be at the very centre of the Sovereign Civil and Military Hospitallers Order of the Good News.

Our Organism Possesses an Inexhaustible Creativity and Remarkable Self-Healing Capabilities

“In regards to diagnosis of Cancers, around 40% of routine examinations, reveal old encapsulated tumors, which should be left untouched.

If the diagnosis has caused any conflicts, such as a death-fright conflict or a self-devaluation conflict, these conflicts need to be addressed. In any case, there is never a reason to panic or to be scared of “metastasizing cancer cells”.

A new consciousness, it is the awareness that our organism possesses an inexhaustible creativity and remarkable self-healing capabilities, it is the recognition that each cell of our body is endowed with a biological wisdom we share with all living beings. In biological terms, a living organism is an inseparable Unity: of the Psyche, the Brain, and the Organ.

The Brain is the Main Computer of our Organism

All processes of the Psyche, and the Organ are coordinated from the Brain.

Essentially, the Brain is the main computer of our organism, and the Psyche the programmer.

Body and Psyche together are basically the "data receiver" of the computer brain (both in optimal programming mode and also when errors occur).

By no means is the Psyche the sole programmer of the Brain.

In cases of injuries the organ can also induce an automatic response in the Brain, and in the Psyche.

Acute-dramatic and isolative Conflict Shock that catches us completely off guard.

The Conflict Shock Occurs Simultaneously:

1. **In the Psyche**
2. **In the Brain**
3. **In the Corresponding Organ.**

The Medical Trade is unable to understand Cancer, and its contextual implications because they considered cancer to be incurable, and merely concentrated on eliminating the symptoms on an organ.

Nor is the Medical Trade able to understand the so-called "infectious diseases", because, instead of recognizing them as healing symptoms, we considered them as aggressive diseases with microbes out to destroy us.

When the functions of our organs were programmed into the different brain relays, the functions of microbes were also programmed into our computer brain. Microbes are all more or less specialists not only in terms of the organs they work on but also with regards to how they work.

The Body Heals Itself

In Over 90% of Cases: The Body Heals Itself.

If the patient has been made aware of all the facts, he will no longer need to get frightened by his symptoms.

He can now fully accept these as the healing symptoms they are; all of which had until now caused fear and panic.

In the greatest number of cases, the whole episode will pass without any serious consequences.

Being thus thrown back and forth between hope and panic is a most difficult situation for the patient and the cause for the very worst of complications.

Germ Layers

Embryology generally divides the development of the embryo into 3 so-called germ layers:

1. Endoderm (Inner germ layer)
2. Mesoderm (Middle germ layer)
3. Ectoderm (Outer germ layer)

Which develop already in the initial stages of embryo growth.

All organs derive from these 3 embryonic layers.

Every cell, and every organ of our body, can be ascribed to one of these germ layers.

By classifying all types of growths, swellings, and ulcers according to their germ layer correspondence we find that all "diseases" that relate to the same germ layer share special features (concerning the mesoderm we have to differentiate between the cerebellum-controlled and cerebral medulla-controlled mesoderm).

All cells and organs that derive from the inner germ layer have their brain relay or control center from which they are directed in the brainstem, the oldest part of the brain.

Histologically, and without exception, all Carcinoma are Adeno-Carcinomas, (Adenocarcinomas are a type of cancer that begins in glandular cells, which are found throughout the body and produce mucus, digestive juices, and other fluids).

All cells and organs that derive from the outer germ layer (ectoderm) have their control center in the cortex of the cerebrum, which is the youngest part of the brain.

Fear & Stress

Fear Causes Stress; that is Detrimental to Healing.

Fear Drains the Body of its Healing Energy.

Panic Triggers New Conflicts and Reactions in the Body; Which Hamper the Healing Process. A number of complications can arise during the healing and repair phase - both on the brain level and the organ level.

During the vagotonic stage, it is completely normal to feel tired and without energy for several weeks, or even, as in the case of hepatitis, for several months.

Surgery on a tumor is recommended if vital nerves, arteries or pathways of supply or elimination are affected, for example: When a Large Growth Obstructs the Colon; the Bile Ducts of the Liver, or the Trachea.

This occurs in 15-20% of these cancers and they are the only cases where a tumor may lead to complications.

Encapsulated tumors that could not be decomposed because of the absence of the necessary microbes might have to be removed surgically if they cause discomfort to the patient.

However, the surgeon should only remove as much tissue as is needed.

Since Cancers Do Not "Metastasize" (in muscle tissue), cutting deeply into healthy tissue is unnecessary.

No drug and no therapy in the world can truly cure a disease.

Only the patient can "treat" his symptoms, because only he can resolve his conflict and only he can do the healing!

Sedatives and Tranquilizers taken over a longer period of time, carry the risk of turning an active conflict into a hanging conflict.

They also drastically diminish the motivation and the energetic force necessary to resolve the conflict. Not at all recommended during this period are sympathicotonic agents, since they enhance and prolong the conflict-active symptoms, with potentially serious consequences for the patient.

An Individual Who Eats Properly Is Less Susceptible to Suffer Biological Conflicts." - Dr Ryke Geerd Hamer, MD, in "Writings & Lectures", 2005.

The Clinical Research Showing The Correlation Between a Diseased Organ and Its Brain Manifestation

Dr Ryke Geerd Hamer, MD, in 1959 passed his Medical State Examination in Marburg, and 2 years later, completed his residency, and was granted a professional license as Doctor of Medicine.

Dr Hamer, then specialized in Internal Medicine in 1972 at the University Clinics of Tubingen and Heidelberg.

In 1978 Dr Hamer, was studying, as an Oncologist, in a Cancer Research Clinic in Germany.

In August 1978, he received devastating news that his son (who had been shot, really traumatic), but his son wasn't dead, his son Dirk, was accidentally shot.

Dirk's battle before death lasted 4 months, **while his father watched him day and night.**

It became clear to Dr Hamer, (3 years later), that **this Life Event Had Created an Internal Shock, that Resulted in him the Development of a Testicular Carcinoma. Thus, he worked to understand his own disease, during this process he experienced a spontaneous remission of his cancer.**

This gave Dr Hamer, the understanding that the things he corrected within himself, during this process of personal growth influenced the cure his own cancer. After this personal incidents, Dr Hamer, MD (University of Tübingen in 1982), understood that Some Forms of Cancer; can arise from Emotional and Biological Shock (Dr Hamer "Cancer – The Mystery That Cannot Be Solved", 2001), **causing the individual to retract from the world with a destructive resignation regarding his fundamental wishes. This shock may go so deep that it can influence the whole biology of an individual organism, and it may steep deeper into existence than just the mind. Mental Shock can act as a trigger for disease (it is worthy of note that wild animals don't get metastases).**

This was named "Dirk Hamer Syndrome", and correlates how Traumatic Shock; may lead to a Biological Conflict, which may cause Disease in the Organism.

Strong Shocks create a physical reaction in the body, this effect can be detected by the study of images of the brain.

Explanatory models of cancer, must be linked to what we already know.

A Biological Conflict Manifests itself in the brain as a "Hamer Foci".

Dr Hamer method of making diagnoses, was to study Computed Tomography images (CT) of the patients brains, in order to locate the foci, and thereby, these can be used to make a correct diagnosis of where in the physical body an individual has developed cancer.

This Hamer Foci, appear as circles on CT images; which are similar to ripples in water. This circles, can only be shown on Computed Tomography images (CT), and not on Magnetic Resonance Images (MRI), nor on Positron Emission Tomography (PET).

Any:

1. **Physical Abnormalities, in any part of the body, is accompanied by a;**
2. **Manifestation in the Brain.**

It is the correlation between this 2 Biologic Events, that was the life long study by Dr Hamer, MD, of this Reflex Biological Phenomena, that Accompanies Disease.

The Establishment of Organic Disease in the body, is thus accompanied by a Biological Manifestation in the Brain.

These Biological Manifestations, can be seen by the use of Computed Tomography images (CT) Brain Scans.

Thus, the study of the Reflex Correlation (both in Health, and in Disease), between the Body Systems, and the Brain is of Paramount Importance, to the understanding of the full workings of the body.

And in particular, those in relation to the Unseen Forces; which are life-giving, which may be perceived, but are at present little understood.

For, Everything in the Body, is Designed, either to function in a:

1. **Bidirectional, or**
2. **Circular manner**

This Are Universal Principles; Applied to the Workings of the Physical Body.

Thus, within the Body Systems, we find Reflexes, and these are in principle endowed with the capacity; of being: Bidirectional in the Application of their Force or Impulses.

Life Is A Continuation

"I have got an inner belief, and an inner faith with God.

I do believe spiritually we have to progress, because we've been here before.

The Physical Body is just an overcoat for your Spirit.

At death, you take the overcoat off, and your spirit will go on to another life, in a spirit dimension. I think we make mistakes, when we are down here, and our Spirit has to come back and learn. That's why there is an injustice in the world. Why there's certain people born into the world, with terrible physical problems, and why there's a family who has got everything right: physically and mentally." - Glenn Hoddle, England Football Coach, in "Brian Alexander's Sportsweek", BBC Radio 5, 1998.

> ***"Pre-Natal Health Conditions, such as "Disability may, and could be Karma, or something of the individual's own choosing; from a previous life."*** *- in "My Life as a Healer", 1999.*

"My beliefs have evolved in the last years, that the Spirit, has to come back again. That is nothing new, that has been around for thousands of years. You have to come back; to learn and face some of the things you have done, good and bad. There are too many injustices around. You, and I have been physically given two hands, and two legs, and half-decent brains. Some people have not been born like that for a reason. The Karma is working, from another lifetime. It is not only people with disabilities. What you sow, you have to reap.

> ***"Be not deceived; God is not mocked: for whatsoever a man soweth, that shall he also reap. For he that soweth to his flesh shall of the flesh reap corruption; but he that soweth to the Spirit shall of the Spirit reap life everlasting. And let us not be weary in well doing: for in due season we shall reap, if we faint not."*** *- Galatians 6:7-9*

You have to look at things that happened in your life and ask why. It comes around." - in "Glenn Hoddle puts his faith in God and England", The Times, 30 January 1999.

"In order for you to understand Reincarnation, more easily I will have to touch into the subject of levels.

Many of you might remember that Jesus said:

> ***"There are many mansions in my father's kingdom."***

I have come to understand through my meditation, that there are 7 Mansions of light, but I prefer to call them levels. The next world we move into, when we lose our physical body, is on a different Dimension from ours, but it is still solid, Everything is Solid.

Have you ever asked yourself; why Jesus preached on the Mountainside, and not in the Synagogue?

The answer is simple: He had to stand on the mountainside because; He had to reach people from all religions, and all walks of life. It didn't matter to Him what religious they had. He needed to Teach Everybody God's laws, and His ways. We are all God's children.

He created each, and every one of us, and if you choose to take one religion, that is your decision. One of the stories in the Bible, I would like to look at, as I am talking about Reincarnation, is about the sins of the forefathers being visited on the sons.

> ***"The Lord passed by before him, and proclaimed, The Lord, The Lord God, merciful and gracious, longsuffering, and abundant in goodness and truth, Keeping mercy for thousands, forgiving iniquity and transgression and sin, and that will by no means clear the guilty; visiting the iniquity of the fathers upon the children, and upon the children's children, unto the third and to the fourth generation."*** *- Exodus 34:6-7*

> ***"The Lord is longsuffering, and of great mercy, forgiving iniquity and transgression, and by no means clearing the guilty, visiting the iniquity of the fathers upon the children unto the third and fourth generation."*** *- Numbers 14:18*

If you are suffering, then you are Probably Paying for Your Own, Sins in a Previous Life. We all have Free Will. That Is One thing that God Wanted Us To Have, and with that Free Will, We Can Choose how we live our lives. So, think about the consequences of your actions, because you will have to face them, whether it is in this life, or another incarnation. The Bible Is Full of Many Wonderful Teachings, and Stories, and I have always enjoyed reading it." - in "My Life as a Healer", 1999.

> ***"Man is: Spirit, Mind, Body; not separate entities but different phases of one constituent — Spirit." Therefore, logically, little understood as both of them are, mental, and physical disease are due to exactly the same causes; and respond to similar treatment."*** *- Dr Ulric Williams, MD, in "Hints on Healthy Living", 1934.*

> ***"This day, now, there is set before thee good and evil, life and death. Choose thou! Whom Ye Will Serve. Ye choose through the Will thy relationships; as to whether they shall be for self-exaltation, self-glorification, self-indulgence, self-gratification, or for the love of life, of truth, of hope, of honour, of virtue, of patience, of brotherly love. Ye yourselves show forth these in the manners, the ways ye deal with thy fellow man! Remember, ever, as ye do it unto the least of thy brethren ye do it to thy Maker. The law of the Lord is perfect, it converteth the soul. There is set before thee good and evil. That whom ye serve is the master, according to thine Own activity. Then, speak and act in His name; He that is the Saviour in the earth."*** *- in "Choose", The Book of Emmanuel or God among men.*

Past Life Memories And Emotional Trauma

"Numerous cases of young children, who report memories of previous lives have been studied over the last 50 years. The nightmares, and post-traumatic play experienced, are typical of the behaviours many of these children display, and demonstrate how difficult apparent past-life memories can be.

An understanding of the link between the apparent memories, and the emotional and behavioural issues, these children experience, may be helpful to families. Nightmares of plane crashing, on fire, and sinking, and being unable to get out:

> ***"Mama, before I was born, I was a pilot, and my air-plane got shot in the engine, and it crashed in the water, and that's how I died, in the Battle of Iwo Jima." - James, at 4 years old.***
>
> ***"I saw the hit. He was hit head on, right on the middle of the engine." - Veteran, who saw Huston's plane get hit***
>
> ***"I was shot down by the Japanese. Corsairs got flat tires when they landed." - James, at 4 years old.***
>
> ***"Corsairs bounced when they landed, leading to flat tires." - Air Force historian***

Awareness of cases such as James one; with documentation of a close agreement between events from a life in the past, and memories that a current child expresses, may lead the parents to be less likely to discount their children's reports, and more able to help them through the experience." - Dr Jim B. Tucker, MD, in **"The case of James Leininger"**, Explore, May–June 2016.

> ***"The memories themselves often began spontaneously, in late adolescence or early adulthood, around age 20 on average. They spanned from prehistoric times, to the 20th century, and across 23 different regions of the world. Most stories described ordinary, often difficult lives filled with hardship, not glamorous pasts. About half of participants (54%), also reported birthmarks or physical marks, they believed matched fatal wounds from previous lives. People who reported higher levels of spiritual practice, forgiveness, and positive religious coping strategies, tended to score better on happiness and mental health scales. In contrast, those who used negative religious coping, such as feeling abandoned by God, or believing their suffering was divine punishment, had worse mental health. Having a belief system to make sense of strange experiences may reduce distress."*** *- in "Past-Life Memories? Impact on Happiness and Mental Health", The International Journal for the Psychology of Religion, 9 July 2025.*

Reincarnation And Biology

"During visit to Sri Lanka 1961, I investigated the case of Wijeratne, who had a severe Birth Defect, said to derive from a Previous Life. A few months later, in Alaska; I studied the cases of Charles Porter and Henry Elkin. They had Birthmarks respectively related to a fatal stabbing with a spear and a gunshot wound. Despite this early introduction to the occurrence of birth defects and birthmarks, it took several years before I fully appreciated the importance of this type of case. Once I had this insight, I plan of collecting the reports of such cases into a large work.

The cases having birthmarks, and birth defects are important for 3 reasons:

1. The birthmarks, and birth defects provide an objective type of evidence, well above that which depends on the fallible memories of informants. We have photographs (and sketches), which show the birthmarks and birth defects. And for many of the cases, we have a medical document, usually a postmortem report, that gives us a written confirmation of the correspondence between the birthmark (or birth defect), and the wound on the person, whose life the child (when it can speak), claims to remember. Despite the obvious difficulties that the concept of reincarnation poses for Western thought in general and modern science in particular, the birthmarks, and birth defects in these cases do not lend themselves easily to explanations other than reincarnation.

2. The birthmarks, and birth defects derive importance from the evidence they provide that a deceased personality (having survived death), may influence the form of a later-born baby. I am well aware of the seriousness (as well as the importance), of such a claim, and can only say, that I have been led to it; by the evidence of the cases.

3. Perhaps most important, the cases with birthmarks, and birth defects provide a better explanation than any other now available, about why some persons have birth defects when most persons do not, and for: why some persons who have a birth defect, have theirs in a particular location, instead of elsewhere. We need to judge this claim against present knowledge of the causes of birth defects.

Even, taking account of the identified medical causes, modern medicine has nothing to say about, why a particular person has a birth defect, when another person does not. Indeed, modern medicine, with its reductionist and mechanical approach to illness, rarely recognizes a person as anything more than the behavioural expression of his or her body. From this perspective, there is no person other than the body. Thus, if someone is born with a birth defect, physicians nearly always attribute this to chance. The cases of this research work, suggest that for some birth defects, we can say why a person has a birth defect, and why the birth defect is in one location instead of in another. The next feature in the development of a case is often a dream, or dreams in which a deceased person appears, and expresses an intention to be reborn to particular parents. I call these announcing dreams. The dreamer is usually a woman who will be the mother of the baby in whose body the announcing deceased personality intends to reincarnate. Sometimes other members of the family, or even friends, may have announcing dreams." - Dr Ian Stevenson, MD, in "Where Reincarnation and Biology Intersect", 1997.

See Also: ***"Reincarnation and Biology: A Contribution to the Etiology of Birthmarks and Birth Defects", Vol. I and II, (2268 pages), 1997.***

All Healing Forces

For, All Healing Forces and influences are constructive; and are thus of the Divine influence. The Applications then, that may be made, Only assist in alleviating; through whatever manner of means may be used, these only assist in alleviating the distressed areas, and in adding to the system the influences that may; through constructive forces; materialize in active forces throughout the body.

All Healing Forces Must Be: Within; Not without!

The applications from without, are to create within a coordinating mental and spiritual force. Thus, it is important; to set the mind, to believe in Something, and let that be creative, and it must be of a spiritual nature. The individual then, must let the Meditative Forces (or Prayer be), when applying the correct Therapeutic Aids, each day. For being in the right attitude and grateful to the Lord is of the Utmost Importance, if Healing Is To Be Obtained.

This should be the Meditation by the Emunctologist, as there is the administering of the Magnetic Influences that should be administered to the body:

“Let thy inner self become more, and more aware of the peace, the harmony, the coordination, the cooperation of God's love, God's peace, God's harmony, in thy physical, and thy mental being; Now!

Healing Meditions

This should be given with those periods of Meditation, and the Magnetic Powers (by the hands, or electrical equipment); that go from body to body, as the superconscious, and subconscious forces possess or direct the material or physical forces through the activity of the spiritual reactions in body:

“The peace and the harmony that comes from the Father of light, and love, that is ours through the promises of the Christ in man, is possessing thy being, now, and making thee whole, as He would have thee; now! In His Name, in His Power, Be Thou Whole!”

In administering the power, or emanations from body to body in periods of Meditation or Prayer:

“Let the powers that may manifest from the holding of the consciousness of the Christ love in the earth now, quicken the spirit within thee, And Make Thee Whole; Now.”

Should Faith Healing be included in the Teachings of Emunctology?

Those who Should, Through faith, laying on of hands, anointing with oil, praying over same. There is, in the broader sense, that innate in each individual that may be awakened to those abilities in their activity, are they willing to attune themselves to the laws as pertain to the active forces in self's Own experience, keeping self unspotted and clean from the world, and Keeping that that brings according in the body that necessary for its awakening to its own spiritual activity.

Who shall do such?

Such as are called in their own experience. Knowing that as has been given, to some is given teaching, to others healing, to others ministry, to others on the various forces as are attributes of His love, His force, in a material world. One that is so given, then, let them Sanctify Their selves, Their bodies, Their minds, to his Fellow Man's service; for he that lendeth to the Lord covers a multitude of sins.

Why Emunctology Was Established

The Regents of the Hospitallers Order of the Good News, have Proposed:

The Creation of a New Field of Understanding in Clinical Therapeutics, in Resolving Disease, by the application of such, thus, Allowing the Body to Recover its Balance, Coordination, and thus achieving Health, without impediment or burden.

These Principles, here given, and the Therapeutic Measures here described, were first applied on self. Upon the Regents of the Hospitallers Order of the Good News, these applied to cure not only us: But Others.

The First Conditions Treated by Emunctology, which resulted in a Full Cure by the body, where:

1. Toxaemia.
2. Sciatica.
3. Pain in the Ear.
4. Arthritis.
5. Attention-Deficit/Hyperactivity Disorder.
6. Constipation.
7. Persistent Diarrhoea.
8. Cramps.
9. Headaches.
10. Polyps in the Uterus.
11. Oedema.
12. And all other conditions, so-called diseases.

Emunctology, is, and was established, with the aim to do good; to be of service to a suffering humanity; to the seeker of health. For All Healing Comes From God. So the Science of Emunctology is under God. For it is a gift from God, and thus it is an Undefeatable Science. That which has been given, that which has been explained, that which fills the pages of the Books “Emunctology: Principles and Foundations of the Emunctory System”, and “Emunctology Reference Manual”, these are the Foundations of Emunctology.

In the same manner, that Osteopathy is that which Dr Andrew Taylor Still, MD, DO, laid down in his Foundation Books, and Chiropractic is; that which Daniel David Palmer, and Dr Bartlett Joshua Palmer, DC, laid down, and explained in their books. The Foundation Books of Emunctology, of Osteopathy, and of Chiropractic, these are - to be exact - that which is enclosed in the founding books, which where first ever to be written, in their particular Clinical Therapeutic Method. All others publications, those that have followed, in the same subject; are but only the interpretation, and expansions of those notions, and those ideas, first given in the Founding Books.

Concerning the General Emunctology Council

The Hospitallers Order of the Good News, Is tasked, in setting, and sending out: The Tenets and Truths, especially as to the Relationships of Sanatoriums.

And, in the Teachings and Ministerings, to the Physical Needs of Individuals in Sanatoriums.

Thus, Emunctologists: Are Those Who Have Supervision Over the Combination of School and Sanatorium. This Combination Is Well, and should be a Part of the Training in Every Institution of Learning; not only the Hygiene and Economics, but the Combination of Preventative Health, Should be a Portion of Every Curriculum, in not only the Advanced, but the Beginnings of Institutions of Learning.

Concerning the General Emunctology Council: A Council Presided over by a Capable Individual, Well Balanced, First Spiritually; That's the First Element Necessary in the change for this Individual to Qualify for Such a Condition.

And to Possess the Material Knowledge as Regarding to:

1. **Physiology.**
2. **Anatomy.**
3. **Materia Medica.**
4. **Hygiene.**
5. **Dietetics.**
6. **The Mental Application; of all as respecting the individual.**

These are necessary qualifications of one heading the Council. Spiritually set, the individual capable of assisting, or directing such an institution.

The Emunctology Sanatoriums, are those places equipped sufficient to Care for those who might be in that position of having those conditions applied to their Physical, and Mental Bodies, for the Correction or Correlating of Same, so that Physically, Mentally, their bodies may be made-nearer whole, performing the functions for which it; The Body, has been given the experience in the earth's plane.

The Emunctology Sanatoriums, are always to be erected Near Large Bodies of Water, and with Pleasant Natural Surroundings.

The General Emunctology Council, is indeed; of the Benevolent Nature.

Has No Stock, Nor Dividends, Yet Charges for the Upkeep of the Sanatoriums, in the nominal way and manner, and there may be endowed such places, or rooms, by individuals or groups that would take care of those that are as the beginning of a more perfect understanding of the Relations Between the Spiritual, the Physical, and the Creative Energies, as Are Manifested in the Material World.

The Sanatoriums Function: WITHOUT, AND FREE FROM ANY DEPRAVED MEDICAL TRADE INFLUENCE, and are Only Staffed with many Practitioners of those other natures; (Hydropathy, Osteopathy, Chiropractic, Neuropathy, Electro-Therapy, Hyperbaric Oxygen Therapy, Materia Medica, Clinical Nutrition), as regarding the treatment of the bodily ills.

The First Necessary Qualification for the Emunctologist; is that of the Spiritual Attitude. It the Mental and Physical Attitudes are correct, the Abilities are correct. The right Spiritual Attitude can be obtained by Fasting and Prayer.

The Body Spiritually must gain the Proper Relations, as must exist between the Mental Body, the Physical Body, and the Spiritual Body.

The application of the one without the other is Not the whole body.

Hence in an Individual: There is the Spiritual Body, there is the Mental Body, there is the Physical Body.

To be a Physician of the Material Body, without a knowledge of the mental body, and the Ability to Apply the Spiritual Force, is Expended, just part of healer, and a healer for money!

Heal for that of: Making the Body One with the Whole.

Hence the Spiritual Insight that the body, the individual, may gain through that of Prayer and Fasting.

The body in a physical manner has those conditions that may be called defects physically. But defects and abnormalities are different conditions.

Defect May Be Made In Mental, a Defect in Physical, or a Defect in direction of Spiritual!

In the defects in the physical body, these are rather as Warnings for each individual, rather than that as of the conditions to be changed.

What ever these conditions may be! Yet, these may be changed.

They are direct conditions, the results of abuse of the physical body.

Learn, then, to Care for the Physical, for the Mental, for the Spiritual!

The Body, the Mind, the Individual (the Soul), has the Abilities (if it will) Apply Them!

As to what is to be done respecting health conditions, it would be well that all precautions known in the activity of he earth be taken (as particular attention to the activities of the body, and the Hygienic Influences in the experiences of the body) to avert an Adverse Influence in the Health of the Body Itself.

The question may be asked:

Why the Mental Hygiene?

Why the Physical Hygiene?

Because of those influences of the Mental Nature, that would cause the body to be attracted to the character of influences that would be detrimental to the physical welfare or sojourn in the earth during any particular period!

Consistency, with General Hygiene and the conduct of the body will bring relief. For Diet and Hygiene will have more to do with the System, Than Anything Else.

General Emunctology Council

"Educating Not Medicating"

Emunctology

Emunctology is the Clinical & Academic Research (Study & Understanding), on the Anatomy & Physiology of the Emunctory System (Elimination Systems of the Body), its Effect in the Cause of All Pathology, Mechanisms of Development (Pathogenesis), Structural Alterations of Cells (Morphologic Changes), and the Consequences of Changes (Clinical Manifestations) in Health. And the study on How to Resolve All Health Conditions, and to Teach on How Each Individual, Can Prevent Same!

Clinical Practice

Thus, the Clinical Practice of Emunctology, Consists First and Foremost, in the Useful and Correct Application of Hydropathy, in its main, and in its greater portion, and when indicated Neuropathy in its application of correctly given Osteopathic Manipulation, Chiropractic Adjustments, this in a Neuropathic manner, and where required Electric-Therapeutics should be given, and The Application in Complement (wherever the indication exists) of All Those Useful Therapeutic Measures (which are needed, in order to aid the body in resolving Dis-Ease), such as: Hyperbaric Oxygen Therapy, Electro-Therapy.

Registration of Practitioners

All Emunctologists are Registered with the General Emunctology Council, and all Emunctologists are members of the Hospitallers Order of the Good News.

All Emunctologists work in Clinics, and Sanitariums are owed and operated by the Sovereign Civil and Military Hospitallers Order of the Good News.

Please note that:

All Emunctologists are members of the Hospitallers Order of the Good News.

In order to Train or Qualify in Emunctology, one needs to be first a member of the Order. Emunctology Practitioners, Doctors of Health in Emunctology are not Osteopaths, Chiropractors, nor "Doctors of the Medical Trade."

Emunctologists don't practice Medical Trade so-called "Science".

Emunctology is not part of the Medical Trade.

Emunctology is concerned with Health not Disease!

Emunctologists are called Doctors of Health, not Doctors of Medicine.

Emunctologists don't drug, nor poison people.

Please Also Note That:

> ***"Experience has proven that those who have previously studied medicine, and afterwards tried to add Osteopathy, have been but a hindrance to the science. An allegiance to Drugs once established, is almost impossible to overcome. After careful consideration, therefore, it has been established that as a general rule no person shall be admitted as a student who has previously studied and practiced medicine.*** *It is desired to make successful operators of all who enter the school, and results have shown: The non-medical student far surpasses those who have studied medicine." - in "Journal of Osteopathy", Vol.1, No.1, May 1894.*

> ***"Various Theories and Explanations which are commonly adduced have been omitted, so that the student may approach the subject with an open mind, but with the assurance that all the movements described have been thoroughly tried and found useful. He will thus be in the advantageous position that he starts with no preconceived theories, and his mind will be unbiassed. In this manner we may ultimately arrive at the Truth."*** *- Dr Thomas Marlin, MD, MB, DPH, RCPS, DMRE, in "Manipulative Treatment", 1934.*

> ***"It's not an accident that they named the prison place that they send children to "School". And what they learn in there is: "How Not to Think!" And they've been at it for a long time, at least 150 years of Mandatory School, and they are very successful. People often talk about schools are failing. It's not true. It's just that their intention is to keep people thinking Illiterate, or what I like to call it: Scientifically Illiterate. So when you have a Scientifically Illiterate Population, led by Scientists and Medical Doctors who are equally Scientifically Illiterate, then this is what happens."*** *- Dr Tom Cowan, MD, in "Has a Virus Ever Actually Been Shown to Exist", UK Column, 16 May 2025.*

Synthetic Drugs

The Human Body is Not Designed to receive Synthetic Drugs.
It is both unnatural and unnecessary. And it is therefore detrimental to ones health, whereby the body needs to recover from a particular ailment, and then to recover from the Toxins and Poisonous Influences of Synthetic Drugs.

Synthetic Drugs are worse than a placebo, in 3 ways:

1. **It does Not Treat Root Cause of Disease.**
2. **Intoxicates the Body, thus Hindering the Recovery of the same.**
3. **Creates Addiction and or False Sense of Need, and Dependency.**

True Health Care it can never be about Intoxicating ones Body with Synthetic Drugs. The Human Body is a Perfect Machine.

It is designed and build to regenerate itself. Unless it is either deliberately or in-deliberately intoxicated or poisoned both physically and emotionally. It should function in a state of near perfection up to 150 years of good health.

The body like everything in Nature (belongs to and its part of Nature, and it is in Nature, not outside of Nature), receives Healing from the Eternal Force from where all healing come, The Creator. For it is in The Natural World that we find those elements that duly prepared, administrated or taken will aid those forces in the human body to rebalance it to a normal state both in vitality and strength.

> ***"We now come to actual Medicines, or Medicaments**, and find them described as: "That which has power to change the body, according to its quality, contrary to what we term nourishment which can be converted into the substance of the body." **The Power of the Medicine to change the body, depends on the nature of the body, and the circumstances, and the aphorism: "What is one man's meat, is another man's poison", holds good."** - in "The Mouth Mirror", March 1929.*

An Eminent Naturalist
Who Became a Great Physician

"The Impressions thus Made on the Boy's Mind During the Formative Period of his Life, his early adolescence, Were the Elements Out of Which the Mind of the Future Man Was Constructed. Dr Daniel Drake, MD was an eminent naturalist and became a great physician because of that fact.

He learned to love Nature early in life, and tried to understand the things which in the days of his childhood he had learnt to love. This is what made Drake a student of Nature, and gave him such power as a man of affairs in the building up of the great West. With a keen, and open eye, and a heart full of love for the beautiful things that abound in Nature's vast domain, coupled an inquiring mind that was not satisfied to wonder and marvel, but that approached the problems and mysteries of the air, the soil, and the water with a desire and a determination to solve the riddles, and to know the truth.

Thus we see how the foundation to Drake's subsequent career of greatness was laid.

Mussey experimented in various ways to prove that the Skin Does Absorb.

He immersed himself in a bath containing 1.35 kg of Madder (Rubia Tinctorum), and sufficient water to cover the entire body. For days following the urine showed the presence of Madder (red-rose colour).

He also proved that Rhubarb can be absorbed by and through the skin.

These experiments furnished the subject for his inaugural thesis.

In the Directory of 1829 an advertisement appears of Dr L. M. Johnson, who made a speciality of Galvanism as a remedy, and was equipped with the:

> ***"Medical Galvanic Battery where patients can receive this gentle and agreeable stimulus at all times."***

It was also provided with "a powerful Electro-Galvanic Resuscitating Battery which will be free for the Humane Society and the faculty for restoring suspended animation."

Dr Johnson also had discovered that medicines applied externally were "much more beneficial and more likely to subdue certain forms of disease than those administered internally, which most generally irritate, and do much mischief to the stomach and bowels before any specific action can be produced, and the manner of applying those medicines externally in the form of gas is certainly a discovery the most valuable in medicine." - Prof. Dr Otto Juettner, MD, in "Daniel Drake and his followers: Historical and Biographical Sketches", 1909.

> ***We are told by those who knew him, was a gentleman by nature and a Christian from convictions produced by a simple and unaffected study of the Word of God.*** *Daniel Drake graduated from the medical school of the University of Pennsylvania in 1807.* ***He mainly worked on the field of medicine, but also advocated social reforms and contributed to geology, botany, and meteorology, and medical geology.*** *Gert H. Brieger has called him "a heroic figure in American medicine" whose fame is due to his writings, where he also tried to improve medical education and scientific research. In 1827 Drake founded The Western Medical and Physical Journal. In 1828 he founded another journal, The Western Journal of the Medical and Physical Sciences.* ***A religious man, he was a founding Member of Christ Church in Cincinnati, and he advocated the combination of Christian feelings and literature. Sir William Osler, MD, was a great admirer of Drake.***

Vitamin D In The Treatment of Cancer

"Tumor Cells, along with a small proportion of Cancer stem cells, exist in a stromal microenvironment composed of blood vessels, cancer-associated fibroblasts, immune cells, and extracellular components. Recent clinical studies strongly support the idea that **Vitamin D Supplementation Is Associated with a Reduced Risk of Cancer, and a Favourable Prognosis.** Experimental results suggest that **Vitamin D, not only Suppresses Cancer Cells, but Also Regulates the Tumor Micro-environment to Facilitate Tumor Suppression.**

Growing evidence strongly supports the notion that **Vitamin D Deficiency Is Associated with an increased Risk of Cancer, and a poor prognosis.**

Vitamin D Supplementation may Exert Profound Cancer Suppression, particularly by targeting components of the Tumor Microenvironment." - in "Repurposing Vitamin D for the Treatment of human malignancies through targeting the Tumor Microenvironment", Acta Pharmaceutica Sinica B, 6 September 2018.

The Treatment of Disease by Hygienic Agencies

"Nature Materia Medica:

1. **Air**
2. **Light**
3. **Temperature**
4. **Electricity**
5. **Magnetism**
6. **Exercise**
7. **Rest**
8. **Food**
9. **Drink**
10. **Bathing**
11. **Sleep**
12. **Clothing**
13. **Mental influences**
14. **Mechanical or surgical appliances**

Truly remedial agents are materials and influences which have normal relations to the vital organs, and not drugs, or poisons, whose relations are abnormal and anti-vital.

The true Healing Art consists in supplying the living system with whatever of the above it can use under the circumstances, and not in the administration of poisons which it must resist or expel.

All healing power is inherent in the living System.

That the human body has the power to recover, under favourable circumstances, from most of the injuries that may be inflicted upon it." - Dr R. T. Trall, MD, in "The Hygienic System", 1872.

Chapter 2

The Science of Oneness

"The living man, with his interior consciousness of self and individuality is on two planes of nature at once, as a ship is in two media at once, half in the water and half in the air. To manage your ship successfully, you must take cognizance of the laws governing each of those media. To deal successfully with your human being, you must understand his physiology, no doubt, but you must equally understand his psychology, and something of the collateral phenomena of nature in those regions or planes to which the phenomena of the psychic man belong." - *A. P. Sinnett, in "The Rationale of Mesmerism", 1892.*

"All numbers are multiples of one, and all sciences converge to a common point, all wisdom comes out of one center, and the number of wisdom is one." - *Paracelsus*

"You should always remember, that the world or universe is one animated system, including one material substance and one spirit, and that all things have a reference to this one spirit, which pervades and actuates teh whole. You should reflect also, that all nature acts with a united force, and all things concur reciprocally in producing all things; and lastly, what connection and dependence subsists between them." - *Marcus Aurelius, Roman emperor (AD 121-180), in "Meditations", tr. Graves, 4.33, 1792.*

Oneness of Force, Oneness of Time

Oneness, Time, Space, Force, or the own individual is one with the Whole.

The physical world, and the cosmic world, or the astral world, are one.

For the consciousness, the sensuous consciousness, is as the growth from the sub-consciousness into the material world. The growth in the astral world is the growth, or the digesting and the building of that same oneness in the spirit, the conscious, the subconscious, the cosmic, or the astral world. We find, from one to another, individuals; individuals retained in that oneness, until each is made one in the Great Whole. As each and every atom in the Universe has its relative relation with every other atom, then man's development lies in the relativity of all forces, whether applied in the physical world as existent today, or that existence in man's earthly existence before, for The Relativity of One Force Applies to Another. Hence all relative forces apply to man's development, whether mental, physical or spiritual.

Oneness of God, oneness of man's relation, oneness of force, oneness of time, oneness of purpose, Oneness in every effort.

"I find as I look out on the world, in the light of all this new knowledge, a pressure of God upon consciousness everywhere; and if this physical force which is God, moves through, sustains, communes, with each smallest physical atom of the whole, much more must that conscious energy which is God, move through, sustain, commune with, these conscious atoms, these several monads, which are you and I, and our friend, and our brother far away. The even flow of the divine force through every material atom, which is the supreme revelation of physical science in our time, itself leads irresistibly on to the suggestion of the constant flow of spiritual energy in actual communion with every spiritual monad that there is. It becomes but a question of opening the eyes of the soul, unstopping the ears of the inward spirit, to see and hear the God who in us also surely lives and moves and has His being, thereby sustaining ours. As the physical atom is physically touched and held and thrilled by God, it is what we should expect that the conscious monad, no less should be consciously touched and held and thrilled by Him." - *Rev. R. A. Armstrong, in "Report of the Unitarian and other Christian Churches", Philadelphia, USA, 1889.*

"The Rev. J. J. Smith, M.A., D.D., tells us that the only way the great problem of the universe can ever be scientifically solved is by studying, and arriving at just conclusions with regard to, the true nature and character of force. He maintains, in his paper upon "The Unity and Origin of Force"; that, as it is the great organizer of matter, it must not only be superior to it, but also must have been prior, as it existed before organization commenced, and immanent always. Electricity is in principle as material as water. Newton, asserted that gravity must be caused by an agent acting, constantly, according to certain laws. Heat, gravity, light, electricity, magnetism, chemical affinities, are all different phases of the primal force discovered by Keely, and all these forces, it is said, can be obtained from a single ray of sunlight.

"The evidence of Unity or Oneness, even between the physical, vital, mental, and spiritual is seen in the light of this law of correlation." - J. J. Smith.

"A great portion of our muscles contract and relax in obedience to our wills, thereby proving that the mental force can be, and is, in every such instance actually converted into the muscular or the physical." Keely demonstrates the truth of this assertion, claiming that "all forces are indestructible, immaterial, and homogeneous entities, having their origin and unity in one great intelligent personal will force."

The Duke of Argyll says :

"We know nothing of the ultimate seat of force.

> ***Science, in the modern doctrine of conservation of energy, and the convertibility of forces, is already getting something like a firm hold of the idea that; all kinds of forces are but forms or manifestations of some one central force, issuing from some one fountain-head of power."***
>
> ***Professor George Bush writes: "It is equally indisputable that we are approximating the true philosophy which underlies the enlarged, and enlarging spiritual experiences and phenomena of the current age. This philosophy, when reached, will conduct us into the realm of the spiritual, as the true region of causes, and disclose new and unthought-of relations between the world of matter and of mind, is doubtless a very reasonable Anticipation"."*** *- in "Keely and His Discoveries Aerial Navigation", 1888.*

"Partly in accordance with Einstein's Unified Field Theory, which does exist and is alive and well, and is never in the status of being incomplete.

It was stated that way to the public, and was completed about 1938, and given to the government, and we had access to it at the Institute.

All of that says that; All of the elements of our universe, the energies which we normally consider:

1. Electric Field.
2. Magnetic Field.
3. Gravity Field.

Are all interrelated in such a manner that you have a 4th element, which is also locked in to them, and that is Time.

If you manipulate any 3 of those, you can affect the 4th.

In this case, the one we wanted to affect is Time.

So, if you know how to interact between the Electric Field, and the Magnetic Field, or the Gravity Field, you can affect Time. And that of course refers to a limited area in which you can affect those 3 fields.

Through what means?

Electromagnetic manipulations in terms also of certain mathematical constants which relate to the Earth's constants, and one of the main constants here on Earth which was used to generate and to predict window frequencies, or certain phenomena as a mathematical function of Pi over 2.

That is one of the keys, one here if Pi, if you will, and multiples thereof. I won't go into this as a long mathematical dissertation, but basically any frequency involved which is Pi over 2 is active in a special sense.

What they were doing was generating an electric field through the means of a radio transmitter which generates an enormous electric field from an antenna depending on the power level." - Al Bielek, in "Philadelphia Experiment", Coast to Coast AM with Art Bell, 20 June 1993.

There is no Time in Spirit.

"- Life on this planet is the result of some sort of accident, or it is part of some great scheme?

Sir James H. Jeans - I incline to the idealistic theory that consciousness is fundamental, and that the material universe is derivative from consciousness, not consciousness from the material universe. If this is so, then it would appear to follow that there is a general scheme. In general the universe seems to me to be nearer to a great thought than to a great machine. It may well be, it seems to me, that each individual consciousness ought to be compared to a brain-cell in a universal mind." - Sir James Jeans, British Astronomical Physicist, in "Observer", 4 January 1931.

> ***"The Universe begins to look more like a great thought, than like a great machine. Mind no longer appears to be an accidental intruder into the realm of matter. We ought rather hail it as the creator and governor of the realm of matter."*** *- Sir James Jeans, British Astronomical Physicist, in "The Mysterious Universe", 1944.*

3 Perceived Forces Are Single Unified Force

"The basic idea of a grand unified theory is that what are perceived to be 3 independent forces (the strong, the weak and the electromagnetic), are actually components of a single unified force. In the theory each component of the force is related to the others by an underlying symmetry, so that all the components are described by a single force law. The same symmetry implies that, at the fundamental level, there is no distinction between electrons, the weakly interacting massless particles known as neutrinos and the quarks, which bind strongly together to make up protons and neutrons. Experimentally, on the other hand, electrons, neutrinos and quarks behave very differently, and the strong, weak and electromagnetic forces are very different in both strength and character. Thus, the theory is constructed so that the symmetry is "spontaneously broken" in the present universe. Grand unified theories were not the first to make use of spontaneous symmetry breaking - the mechanism had previously been used in the unified electroweak theory." - Paul Davies, Theoretical Physicist, in "The New Physics", 1989.

Science and Religion are One, When Their Purposes are One

Do not doubt the abilities of those influences in the spiritual life to meet the needs of the body physically, mentally, spiritually. Man's development, is of man's understanding and applying the laws of the Universe, and as man applies those, man develops, man brings up the whole generation of man. Individuals carry out certain elements and laws, and gradually man becomes capable of applying and using those in the everyday life of man. This, whether applied in medical science, anatomical science, mechanical science, or any science, is merely the development, or the application as man applies to Universal laws as are ever, and have ever been, existent in the Universe. As is in this: that producing electrical units of force, is just as applicable to the Universal forces in the days of Adam as in the days of the Master, or as in the days of today. Those laws applying to aerial of transmission just as applicable in one as in other. Man not understanding those. Many times has the evolution of the earth reached the stage of development as it has today and then sank again, to rise again in the next development. Some along one line, some along others, for often we find the higher branches of so-called learning destroys itself in the seed it produces in man's development, as we have in medical forces, as we have astrological forces, as we have in some forms of spiritual forces, as we have in forms of destructive forces of the various natures.

> ***"When man attains freedom by giving up self-will, and selfish desires — or, to express it in other words, when by means of the Christ (eternal Light and Truth), he arrives at that state of oneness (at-one-ment) with God, which renders his soul godlike and divine, he then also receives in the Christ a true and essential knowledge of God and of Nature. As soon as the newly-regenerated man becomes manifest, will he attain real knowledge. As the external man sees the external world, likewise the regenerated man sees the divine world wherein he dwells."*** *- in "Life and Doctrines of Jacob Boehme", 1891.*

> ***"The day science begins to study non-physical phenomena, it will make more progress in one decade than in all the previous centuries of its existence."*** *- Nikola Tesla, in "Dr. Nikola Tesla bibliography", 1979.*

As to occult or psychic science, as called, then - it is, as we have found through some manifestations, that these forces are first recognized in or by the individual. Hence, as has been seen, in the beginning these were the natural expressions of an entity. As there developed more of the individual association with material conditions, and they partook of same in such a manner as to become wholly or in part a portion Of same, farther - or more hidden, more unseen - has become occult or psychic manifestations.

First there were the occasional harking back. Later by dream. Again we find individuals raised in certain sections for specific purposes. As the cycle has gone about, time and again has there arisen in the earth those that Manifested these forces in a more magnificent, more beneficent, way and manner. And, as has been given, again the time draws near when there shall be seen and known among men, in many places, the manifestations of such forces in the material world; for: "As ye have seen him go, so will He return again."

Be thou faithful unto those words He has given while yet with you. Hence it behoves every individual to take cognizance of that force that may manifest in their material lives, even in this material age; for those that become ashamed for His sake - for That sake - of that that may manifest (which is as the Spirit's manner of activity) through those many channels that are open to those who will look up, lift up - and these, we find, are often in the lowliest of places and circumstances. Even as in those first experiences with the use of those powers that are so tabu by the worldly-wise, that are looked upon as old men's tales and women's fables; yet in the strength of such forces do Worlds come into being!

This is what Psychic Force, and So Called "occult science", Did mean, Has meant, Does mean in the world today. There were those individuals that attempted to bring again to the mind of man more of those forces that are manifest by the closer association of the mental and spiritual, or the soul forces that were more and more as individual and personal forms in the world, the use of the these elements; as for the building up, or the passage of individuals through space; brought the uses of the gases then (in the existent forces), and the individuals being able to become the elements, and elementals themselves, added to that used in the form of what is at present known as the raising of the powers from the sun itself, to the ray that makes for disintegration of the atom, in the gaseous forces formed.

> ***"What we have found in our laboratory is that the energy of mind projected through a crystal will structure water just like it was frozen into ice. The remarkable, and unique differentiation is that, water, when it is structured with mind, and with thought, remains fluid. But structured, that type of category is called a liquid crystal, a mesophase, a mesomorphic transition."*** *– Marcel Vogel, lecturing upon the structuring of water.*

Experiments with Alternate Currents of High Potential and High Frequency

"But there is an additional feature of interest about this motor, namely, **it is not necessary to have even a single connection between the motor and generator**, except, perhaps, through the ground; for not only is an insulated plate capable of giving off energy into space, but it likewise capable of deriving it from an alternating electrostatic field, though in the latter case the available energy is much smaller. In this instance one of the motor terminals is connected to the insulated plate or body located within the alternating electrostatic field, and the other terminal preferably to the ground. It is quite possible, however, that such "no-wire" motors, as they might be called, could be operated by conduction through the rarefied air at considerable distances. Alternate currents, especially of high frequencies, pass with astonishing freedom through even slightly rarefied gases.

The upper strata of the air are rarefied. To reach a number of miles out into space requires the overcoming of difficulties of a merely mechanical nature.

There is no doubt that with the enormous potentials obtainable by the use of high frequencies and oil insulation, luminous discharges might be passed through many miles of rarefied air, and that, by **thus directing the energy of many hundreds or thousands of horse-power, motors or lamps might be operated at considerable distances from stationary sources.**

But such schemes are mentioned merely as possibilities.

We shall have no need to transmit power at all. Ere many generations pass, our machinery will be driven by a power obtainable at any point of the universe. This idea is not novel. Men have been led to it long ago by instinct or reason; it has been expressed in many ways, and in many places, in the history of old and new. We find it in the delightful Myth of Antaeus, who derives power from the earth; we find it among the subtle speculations of one of your splendid mathematicians and in many hints and statements of thinkers of the present time.

Throughout Space There Is Energy

Is this energy Static or Kinetic? If static our hopes are in vain; if Kinetic; and this we know it is, for certain; then it is a mere question of time When Men Will Succeed in Attaching Their Machinery to the Very Wheel-Work of Nature. The desire that guides me in all I do is the desire to harness the forces of nature to the service of mankind. Everything in the universe resonates at it's own frequency, yet they all relate on a harmonic scale to each other. Understanding my work means understanding the key to the universe, resonance. Our senses enable us to perceive only a minute portion of the outside world. Though free to think and act, we are held together, like the stars in the firmament, with ties inseparable. These ties cannot be seen, but we can feel them. The gift of mental power comes from God, Divine Being, and if we concentrate our minds on that truth, we become in tune with this great power. All that was great in the past was ridiculed, condemned, combated, suppressed: only to emerge all the more powerfully, all the more triumphantly from the struggle." - Nikola Tesla, in "Institution of Electrical Engineers", London, 1892.

This Will End Shortages of Food, Raw Material, Germinating Substances & Fuels Instead of Capitalism & Bolshevism: A True Socialism Will Arise: About Which Christ Preached 2,000 Years Ago; And Taught of Transformation of Matter Into Spirit

"To put it briefly and simply: We have been taught to wind up the ur-works like a clock, i.e. axially->radially.

However, the ur-works that maintain the clock-springs of hunger and love in constant motion must be wound up radially->axially, because only thus is it possible to enable the suctional components to prevail, which produce levitism = upwardly streaming magnetism.

In reality, for the last 2000 years the opposite has happened.

Only the Catholic Church, even if merely symbolically, has indicated the naturalesque way to transform matter into spirit.

On the other hand, in all areas of the economy and industry secular science instructed and taught the opposite "winding".

Therefore, **in lieu of the evolution-fostering (ennobling) spirit, it raised and reinforced the demon in the form of development-impeding electricism, as if by conveyor belt, to such an extent that the magnetism-generating Earth, which moves in cycloid-spiral-space-curves, is now incapable of neutralising the decomposive energies and their effects produced by millions upon millions of human beings.**

It was therefore inevitable that we should be assailed by the catastrophes of Nature that we are presently experiencing.

They are exactly the opposite of those experienced by the Atlanteans, who realised the danger of over-stimulating formative and levitative energies, only when whole sections of the Earth were wrenched skywards by these elemental (metaphysical) suctional forces.

All today's machines, all methods of conveyance and the production of light and heat enable the lower-grade heat-, light- and temperature-producing pressured components to prevail and predominate.

Since no heat or kinetic equivalence exist, but only the reactive intensification of development-fostering or development-impeding energies, an economic, social, moral and cultural decline had to take place as the scope of pressure-inducing machines and other such devices increased and intensified.

Accordingly we have to learn the lesson from both extremes and balance out both forms of motion and acceleration in such a way that in accordance with the well-known equation F=ma, the desired force F in the form of a predominantly magnetic ion constantly possesses enough levitational superiority to ensure that natural increase and qualitative improvement can keep pace with the unavoidable increase in the population.

That is to say, the standard of living must be regulated through the use of higher-grade (quality-increasing) retro-influent dynagens, which come into being when bipolar threshold masses are centripetated in accordance with the equation E=mc2.

In other words, when they are accelerated by radially->axially in-winding forces to a speed exceeding that of sound under the simultaneous effect of a falling temperature gradient, i.e. accelerated along the longitudinal axis above their boundary velocities.

This gives rise to the higher-grade factors of temperature, light and energy out of which upwardly streaming magnetism springs forth from the spiritual embryos, the vitamin-molecules mentioned at the beginning.

These are suspended in a delicately balanced state of equilibrium in the media of air and water and await the naturalesque motive impulse in order, as refined subtle matter, to transform themselves into formative, multiplying and ennobling retro-influent energies.

This will signify the end of the present shortages of food, raw material, germinating substances and fuels, and instead of capitalism and bolshevism a true socialism will arise about which Christ preached 2,000 years ago, who taught of the transformation of matter into spirit with the aid of the above form of motion.” - Viktor Schauberger, in “The Energy Evolution”, 2000.

> ***“The whole Evolutionary process, both Cosmic and Organic, Is One, and the biologist may now rightly regard the Universe in its very essence as biocentric.”*** *- Professor Lawrence Joseph Henderson, Harvard University.*

> ***“We cannot be suppressing one part of the science; because it does not agree the dogmas.”*** *- Dr Luc Montagnier, MD, Nobel Prize in Physiology or Medicine 2008, in “El Diario Vasco”, 10 May 2016.*

“The existence of a highly compressed layer of hydrogen atoms over the surface of solids would explain the very interesting fact that H3 is produced so much more readily by bombarding solids than in any other way, for on the surface of these solids we have the atoms in an ideal condition for combination, packed so close together that they are almost in contact, and at the same time ionized and liberated by the action of cathode rays.

Though we cannot expect to get rid of layers of hydrogen atoms by heat treatment we may expect to be able to do so by long-continued bombardment with cathode rays; the maintenance of the vacuum in a Coolridge tube in constant use is a proof that this is the case. Though we ought in this way to be able to eliminate the hydrogen from the walls of the tube, yet I have never yet been able to eliminate the lines corresponding to the atom and molecule of hydrogen from the positive ray photographs.

This is usually ascribed to the hydrocarbon vapours given off by wax used to join up the glass bulb to the metal parts of the apparatus or to the grease used to lubricate the taps.

No doubt each of these is a source of vapours containing hydrogen, but I am not satisfied that it is the only source.

I have replaced the wax joint by one in which a layer of copper deposited on the glass was soldered to the metal, and liquid air traps were placed between all the taps and the bulb: even with these precautions the hydrogen lines were quite bright on the photographs." - in "Rays of Positive Electricity and Their Application to Chemical Analyses", 1921.

To Understand a Multi-Dimensional Universe, what would be the Dimensions we are unaware of?

Any Dimension higher than the 3, that we're familiar with, or the actual 4 that we're embedded in.

We live in a 4-Dimensional world.

You have never met someone at a place, unless it was also at a time, and you have never met someone at a time, unless it was also at a place.

That requires 4 Dimensions of a portal.

We need 4 Dimensions, to localize someone, to meet up with them.

Only 2 Dimensions if you don't have tall buildings, if you have tall buildings you need the 3rd Dimension.

Thus, you don't say, I'll meet you at the 10th floor of 7 Golden Avenue.

At what time?

There's a full 4 Dimensions, going on there, so we live in a 4-Dimensional world.

It may be, that these 4 Dimensions are manifest to us, but that in fact; we are embedded in a higher dimensional space.

Strength theorists, on the frontier of this exercise, are hypothesizing at least the existence of 10 Dimensions, to account for everything we see in the universe, even if we do not directly measure those dimensions.

> ***"The science before its incapacity, before the mystery that it has and it does not see, does not reflect that if nothing sees, it must not deny as it does, everything inexplicable, the illogical, which according to her cannot be, because she has in her Hands the Truth. The Petulant science says: "This is" or "this is not", she is unappealable, and to every question mark she smiles in mischief, becoming a permanent inquisitor, while the world advances in events that she calls them unusual insanity proper of ignorants or alcoholised. Science will know one day, that everything is natural and is true in the way of reality and unreality, tangible to many who know that we are all part of something that although it is not felt, exists. Science will know one day."*** *- Benjamín Solari Parravicini*

One Source of Energy

"Our senses enable us to perceive only a minute portion of the outside world. ***If you want to find the secrets of the universe, think in terms of Energy, Frequency and Vibration."*** *- Nikola Tesla, in "The Transmission of Electrical Energy Without Wires As a Means for Furthering Peace", 7 January 1905.*

All Matter Comes From A Primary Substance: The Luminiferous Ether

"Long ago man recognized that all perceptible matter comes from a primary substance, of a tenuity beyond conception, filling all space, the Akasha or Luminiferous Ether, which is acted upon by the life-giving prana or creative force, calling into existence, in never-ending cycles, all things and phenomena. The primary substance, thrown into infinitesimal whirls of prodigious velocity, becomes gross matter; the force subsiding, the motion ceases and matter disappears, reverting to the primary substance." *- Nikola Tesla, in "The Psychic Observer", 10 April 1945.*

Energy, Frequency And Vibration

The Different Forms:

1. **Light.**
2. **Sound.**
3. **Heat.**
4. **Magnetism.**
5. **Colour.**
6. **Electrical Energies.**

These Are "All Different Forms of ONE Source of Energy"; They Differ Only in "Frequency of Vibration", and "Medium of Conduction."

As for Colours Pertain to Life itself.

Tone And Harmony

1. Tone And Music Is Colour.

2. Colour Is Vibration.

3. Vibration Is Movement.

4. Movement Is Activity of a:
+ Positive Force.
or
- Negative Force.

Chiropractic Founded On Tone

"The Chiropractor Adjuster: To all, who long to elevate the human race by freeing it from ignorance, traditional prejudice, superstition, and the pernicious delusions of the "Superiority of Drug Medication", and the "Necessity of Surgical Mutilation", and especially to those who desire to know the best method of removing the unnatural and unnecessary condition called "disease—conditions" which, not only cause great suffering, shorten life, and lessen natural and intellectual progress, but prevent that proper acquirement of Metaphysical Knowledge, so necessary for The Next Stage of Existence, this book is most earnestly dedicated.

Life Is The Expression of Tone

In That Sentence; Is The Basic Principle of Chiropractic.

Tone is the normal degree of nerve tension.

Tone is expressed in functions by normal elasticity, activity, strength and excitability of the various organs, as observed in a state of health. Consequently, the cause of disease is any variation of Tone; nerves too tense or too slack.

The Science (knowledge), and Art (Adjusting) of Chiropractic, were formed at that time, I began a systematic investigation for the cause of all diseases, and have been amply rewarded. I founded Chiropractic, on Osteology, Neurology, and Functions; bones, nerves and the manifestations of impulses.

I originated the Art of Adjusting vertebrae, and the knowledge of every principle which is included in the construction of the Science of Chiropractic.

The amount of nerve tension, determines health or disease.

In health there is normal tension, known as Tone, the normal activity, strength and excitability of the various organs and functions as observed in a state of health.

The kind of disease depends upon what nerves are too tense, or too slack.

Functions performed in a normal manner and amount result in health.

Diseases are conditions resulting from either; an excess or deficiency of functionating. The dualistic system: Spirit and Body; united by intellectual life - the soul -, is the basis of this Science of Biology, and nerve tension is the basis of functional activity in health and disease.

Spirit, Soul and Body; compose the being, the source of mentality.

Innate and Educated, two mentalities, look after the welfare of the body physically, and its surrounding environments.

Chiropractors correct abnormalities of the intellect, as well as those of the body. These discoveries and their development into a well-defined science, are worth more to the student, practitioner and those desiring health." - D.D. Palmer, in "Chiropractic for Students and Practitioners", Founded on Tone, 1910.

Man Is A Living Dynamo

"The composition and structure of the Universe, on the one hand, and that of Man on the other, represent but two aspects of a common Biological Law.

Light, Life and Matter are the 3 fundamental principles through which that universal law, comes into manifestation, and governs all the phenomena occurring in nature. The biological motion of nature is basically heliocentric (Sun Light). Physical life in its final analysis is by some described as a bio-chemical process. But we find that behind all the visible processes which can be produced and analysed in the laboratory; there is still another constant, although invisible activity, which directs the visible exchange of matter and controls the morphological equilibrium of an organism.

This Invisible Energy is Present in a relatively Steady State in Every single Particle of a Physical Body, converting every speck of matter into a centre of force, and a whirl of motion, forming thus a transitory web of radio-active substance which serves as a bridge for sensations, and a Link for Communication Between Tangible and Tenuous States of Matter.

The human body, in its final analysis, is also known to be made up of the same elements as the whole of creation, and if man were sufficiently magnified he would be found to consist of a mass of luminous whorling particles held together in a state of tension. Exhibiting the phenomena of attraction and repulsion, of cohesion and separation, expressing the energy of that particular body in terms of Life.

Light and Life Are So Closely Connected That One Cannot Exist Without The Other.

For Example: It is already a well-known fact that radiations similar to those of light are constantly given off by the body in the form of minute electrical discharges which surround the body with an electro-magnetic field of force or "Aura", not only perceived by sensitive people, but which has been measured by scientists, and is known to extend to a distance of several feet or even yards around the body.

Every single cell of our body, contains within its walls a definite and constant quantity and quality of radio-active energy, projecting and receiving electro-magnetic vibrations of varying frequency and intensity.

According to their quality, vibrations travel to various distances, the distance travelled representing a "mean free path of motion", along which any selected impulse can be propagated and transmitted to, and from, one body to another.

This mean, free path of motion, is the chief and basic contact line which can be scientifically determined and utilized for the transmission and reception of vibratory impulses, independently of distance or time, provided the individual is tuned up to the correct frequency. Man Is A Living Dynamo, and the human body is the most sensitive and perfect instrument of all creation. The close relationship which exists between electro-magnetic phenomena, vibration in general, and human vibrations, is more easily appreciated when either are converted into sound, as any of them may be by any instrument capable of registering and emitting sound. To preserve or restore health it is essential to maintain a harmonious distribution and exchange of electromagnetic vibrations within the organism. Whether the cause of a disease is considered to be primarily mental, psychological or physical, it is secondary to the fact that ill-health is always the proof of a vibratory disturbance in the organism which can be readjusted by Light, whether in the form of Diet, Sunlight or any of its reproductions which will produce a perfect Chromo-Static Synchronization.

Spectro-Biology is therefore fundamentally the study of Cosmic Geometry through the agency of Light with the object of establishing infallible evidences of the relation existing between Light and Matter, which alone can lead us to understand the intricate part played by Solar Radiations in the evolutionary process of life." - Countess Maryla de Chrapowicki, D.Psy., in "Spectro-Biology", Journal of the International Institute for Psychic Investigation, April 1940.

> ***"Musical Sound had a highly statistically significant effect on the number of seeds sprouted compared to the untreated control over all 5 experiments for the main condition and over time. This effect was independent of temperature, seed type, position in room, specific petri dish, and person doing the scoring. Musical Sound had a significant effect compared to noise and an untreated control as a function of time while there was no significant difference between seeds exposed to noise and an untreated control. Healing Energy also had a Significant Effect compared to an untreated control and over time with a Magnitude of Effect Comparable to that of Musical Sound. Conclusion; This study suggests that Sound Vibrations (Music and noise) as well as Biofields (Bioelectromagnetic and Healing Intention), Both Directly Affect Living Biologic Systems, Seed Germination Bioassay, has the sensitivity to enable detection of Effects caused by Various Applied Energetic Conditions."*** *- in "Measuring Effects of Music, noise, and Healing Energy using a Seed Germination Bioassay", Journal of Alternantive Complementary Medicine, February 2004.*

Luxations Are Caused by Direct Traumatism, Poisons or Auto-Suggestion

"The writer is attempting to awaken interest in the teachings of D. D. Palmer who wrote:

> ***"The Determining Causes of Disease Are Traumatism, Poison and Auto-Suggestion. These Luxations are Caused by direct Traumatism, Poisons, or Auto-Suggestion."***

There are numerous other references by D. D. Palmer, to the importance of the mind as a causative factor in the production of subluxations, and generalized vertebral distortion.

Many Chiropractics have failed to appreciate the depth of insight, and did not emphasize this causative area.

Of late, the Chiropractic profession has been taking an interest in courses which stress the spiritual and mental approach to the problems of disease.

And the mechanism by which the emotional stress manifests itself in somatic disturbances, or disease, through the distress of function of the vertebral column, known as subluxation.

It is of the utmost concern to awaken an appreciation in the minds of doctors of Chiropractic, for the heritage left by D. D. Palmer, which provides the basis for the most **complete understanding of the patient as a unit of structure and function.**

Nor is this to be assumed to indicate a concurrence with the total writings of the founder of this profession.

These fundamental principles, supplied by D. D. Palmer, provide a skeleton for the biological facts which make scientific Chiropractic one of the most comprehensive schools yet devised. The Chiropractor needs to experience no twinge of inferiority as he views the mottled array of theories.

The founder of the science of Chiropractic appreciated the working of Universal Intelligence (God); the function of Innate Intelligence (Soul, Spirit or Spark of Life) within each, which he recognized as a minute segment of Universal; and the fundamental causes of interference to the planned expression of that Innate Intelligence in the form of Mental, Chemical and or Mechanical Stresses, which create the structural distortions that interfere with nerve supply and thereby result in altered function to the point of demonstrable cellular changes, known as pathology.

The above paragraph was quoted by the committee under Health, Education, and Welfare Secretary Cohen in its effort to derogate Chiropractic, but in no instance was any ability demonstrated to understand the neurological mechanisms explained in later chapters to justify this statement of fact.

Had attention been directed to the writings of Kervran the gentlemen of the committee might have avoided mindset on the fallacy that allopathic medicine has all, and the only answers to the restoration of health, for he states:

> ***"All laws of classical physics have been deduced from experiments made on dead matter. The principle of divergence — of elastic waves, acoustic, luminous, or material: all the physical waves of the inert — is not applicable to biology. The greatest men of science now recognize that neither the chemistry nor the physics of inert matter is integrally applicable to living matter.*** *Szent-Gyorgyi, who was awarded the Nobel Prize, expressed this point quite well in his disagreement with the physicists of yesteryear: "This makes the relationship between the physicist and the biologist rather delicate... If I had always accepted the physicist's verdict, I would have abandoned this way of research. I am glad that I did not do it."* ***He arrived at the conclusion that molecular biochemistry is not enough to make us understand what happens in living matter, that one should take a step down in the structure and study the atom, because it is at the sub-atomic level that the unknown is being produced. Otherwise "physics is the science of probabilities... biology the science of the improbable."*** *(Szent-Gyorgyi, Introduction to a Submolecular Biology, 1960) The improbable surely happens, because quantum mechanics proceeds only on the basis of statistics. But in biology things are different. An electron makes a sure jump and one only; it never misses the target. (This explains the small amount of energy necessary.) Why? This fact brought Szent-Gyorgyi to write: "Even quantum mechanics should be improved in order to be applicable in the analysis of most problems in biology." We are hanging in the air!"* - **Professor Louis C. Kervran, Scientist, proposed that nuclear transmutation occurs in living organisms called "biological transmutation",** *in "Biological Transmutation", Phoenix Journal, No.149, 1995.*

While the phenomena of life, and functions of living matter have been unravelled to a very marked degree by scientists working with lavish expenditures of tax dollars, there remains much that is yet inexplicable, as Kervran stated:

> ***"It will be widely demonstrated that there are other biological phenomena unexplainable by the movements of the electrons — that is, by chemistry or physico-chemistry — because of a frequent incompatibility between biology and these sciences".***

Recognizing the multiform stress of environment upon the total human structure, the Chiropractic seeks to normalize the neurological and anatomical responses to such disease-producing factors, recognizing that in instances other branches of Therapeutics may be required for specialized skill and knowledge.

The total patient and his welfare should be the first concern of any would-be physician.

As Dr C. A. Pinkenburg pointed out, Dr Thomas Sydenham called **"the healing powers of nature"**; Haller named it **"Vital Force"**; Dr A. T. Still, referred to this healing and regulating phenomenon of the body as **"Divine Essence"**; D. D. Palmer coined the phrase **"Innate Intelligence"** to express this manifestation for which the best minds of this enlightened age have no explanation, although much has been learned about the mechanisms of the body since D. D. Palmer's day and Innate Intelligence has been pushed into a smaller area.

The day may come when scientists have unravelled all of the mysteries of the human body and there will be no need for terms such as Innate Intelligence, Ego, Libido, Homeostasis, etc., to hide ignorance.

The adjusting of each, and every articulation of the human frame was stressed by Dr Palmer in a number of places in his text, as follows:

> ***"It is, or should be, the business of the Chiropractor to restore to normal position any displaced portion of the bony framework."***

What more could any doctor require of his science? What more has science, metaphysics, or religion to offer the conscientious would-be healer?

The failure to appreciate the teachings of D. D. Palmer has created many fallacies, deficiencies, partial truths, discontent, bickering and, above all, feelings of inferiority within the ranks of the profession. **Are turn to the basic principles, as enunciated by the founder, would remedy many of the problems.**

A structural problem, brought about by a mechanical or chemical cause, may so disturb the mental balance of the individual that he is no longer capable of coping with the emotional stresses of his environment.

Dr Herman S. Swartz discussed an essential phase of this disturbing relationship of the subluxation to the Psyche in his article:

> ***"The art of restoring disrelated skeletal and / or muscular tissue to its normal design is psychosomatic, per se, because it corrects and removes the faulty structure or subluxations responsible for the nerve irritations affecting a particular Organ or Gland. Every nerve infringement within the vertebral column is an incipient pathological state involving some concurrent psychic infringement. This initial "malformation" may readily lead to a true psychosomatic condition if the patient centrally superimposes upon this localized neural irritation evoking specific regional pain the additional generalized or widely distributed weight of fear in any one of its protean forms. Thus increased by a remoter reinforcement from another power area or energy source, the pain is necessarily paralleled by a corresponding growth in fear, worry, and anxiety, and the slow nibbling away of the sufferer's psyche goes on apace. In this fashion, a minor subluxation can turn into a full-flowered psychic upset if the patient uses his unalleviated discomfort:***
>
> ***1. To escape reality;***
> ***2. To avoid his obligations to himself and others;***
> ***3. To "get even" with some superior, associate, or family member;***
> ***4. To interpret his pain as divine punishment for some offense, etc.***

> ***If, as is so commonly the case when sedatives are administered, the pain is deadened by medication, then the mental faculties are benumbed in some degree with the further result that temporary personality deterioration ensues, normal confidence and poise are destroyed, and childhood fears, frustrations, and feelings of guilt and rejection become prominent to such an extent that the initially uncomplicated "winding base" goes unrecognized by both doctor and patient. In this way a simple fall, blow,or other injury eliciting some anatomical distortion can grow into a full-bodied neurosis or psychosis. Conversely, correcting the distortion brings relief, recovery, and cure in enough cases to demonstrate that chiropractic, per se, is beneficial to the mentally disturbed, whether used alone or in conjunction with auxilliary psychological aids." -*** *Dr Herman S. Schwartz, DC, in "The Foundations of Chiropractic Psychosomatics", The Journal of the National Chiropractic Association, January1954.*

Guyton deals with the influence of the hypothalamus and reticular activating system as parts of the neurological mechanism of psychosomatic illness.

He discusses three routes by which the adverse effects of increased activity of the hypothalamus may occur:

1. **Through motor nerves to the skeletal muscles;**
2. **Through the sympathetic and parasympathetic divisions of the automatic system;**
3. **Through pituitary hormonal secretion. No attempt is made to follow the neural pathways.**

The doctor of Chiropractic must maintain an objective point of view and not be carried to extremes by either the psychosomatic or somatopsychic approach.

Both are important. In one case the emphasis may be required on the former,while in another instance the latter is the secret to unravelling a complex health problem.

The Chiropractic should be acutely cognizant of the importance of structure in every health problem and be astute enough to appreciate that his adjustive ministrations are indicated in each instance.

If mental stress is the basic cause, structural distortion precedes, or is a concomitant of every disease and is deserving of his skill and knowledge.

If mechanical disrelation has upset the affective mechanism and disturbed the ability of the mind to cope with emotional stress, it is crystal clear that correction of the physical is of paramount importance.

Chiropractors have been taught from the days of D. D. Palmer that the cells of the body have the knowledge, Innate Intelligence or homeostatic tendency, to know their own needs for growth, function, reproduction and repair; that the nervous system, was, and is, supreme in coordinating and integrating unit function into organic function and into body function and action; that the

nervous system is all-important in health and in disease; that those factors which interfere with normal neural activity result in disturbed organic, somatic and cellular function; that the disturbances of function are accompanied by the symptoms and tissue changes of disease.

Sachs substantiates the above statement:

> ***"A detailed study of the vegetative nervous system in various diseases of the internal organs. Every pathological condition is obviously associated with disturbances in the autonomic nervous system. The sensations arising from a diseased organ, the pain or discomfort, are conveyed to the higher centres to consciousness. Through the vegetative afferent fibres. Among the evidences of vegetative nervous activity in disease, pain is the most important symptom of disturbance, and in all clinical work the evaluation of pain as a symptom is of paramount importance."*** *- Dr Wulf Sachs, in "The Vegetative Nervous System: A Clinical Study", 1936.*

As this text progresses the reader will find more and more evidence of the truth of this statement and the interdependence of structure and function through the activity of the nervous system.

Reflex Arcs

> ***"Nervous cells present a feature so characteristically developed in them as to be specially theirs. They have in exceptional measure the power to spatially transmit (conduct) states of excitement (nerve-impulses) generated within them.***
> ***Since this seems the eminent functional feature of nerve-cells wherever they exist, its intimate nature is a problem co-extensive with the existence of nerve-cells, and enters into every question regarding the specific reactions of the nervous system.***
> ***This field of study may be termed that of nerve-cell conduction.***
> ***But a third aspect which nervous reactions offer to the physiologist is the integrative.***
> ***In the multicellular animal, especially for those higher reactions which constitute its behaviour as a social unit in the natural economy, it is nervous reaction which par excellence integrates it, welds it together from its components, and constitutes it from a mere collection of organs an animal individual.***
> ***This integrative action in virtue of which the nervous system unifies from separate organs an animal possessing solidarity, an individual.***
> ***There is the mechanical combination of the unit cells of the individual into a single mass.***

> ***This is effected by fibrous stromata, capsules of organs, connective tissue in general, e. g, of the liver, and indeed the fibrous layer of the skin encapsulating the whole body. In muscles this mechanical integration of the organ may arrive at providing a single cord tendon by which the tensile stress of a myriad contractile cells can be additively concentrated upon a single place of application.***
>
> ***Integration also results from chemical agency. There is the integrating action effected by the circulation of the blood. A Simple Reflex is probably a purely abstract conception because: All Parts of the Nervous System Are Connected Together, and No Part of it is probably ever capable of reaction Without Affecting, and Being Affected By Various Other Parts."*** *- Sir Charles Sherrington, MD, in "The Integrative Action of the Nervous System", 1920.*

Progressing now from the single neurone, and its peculiarities to the functional unit of the Nervous System, the Reflex Arc is the next step in the understanding of the Nervous System, and its peculiar, complex and varied functions.

Receptors in skin, tendons, ligaments, joint capsules, muscles, periosteum, blood vessel walls, internal organs, and the organs of special sensation such as the eye, ear, tongue, nose, etc., upon receipt of an adequate stimulus cause a nerve impulse to be initiated in an afferent neurone, which is charged with the responsibility of conducting the impulse into the central nervous system." - in "The Neurodynamics of the Vertebral Subluxation", Chiropractic Publishers, 1973.

> ***'Those Who Understand Physiology and Hygiene: Will, in their Ministerial Labour, Find it a Means whereby they may Enlighten Others in regard to the proper and intelligent treatment of the Physical, Mental, and Moral powers. Therefore those who are preparing for the ministry Should Make a Diligent Study of the Human Organism, that they may Know How to care for the Body, Not by Means of Drugs, But From Nature's Own Laboratory. The Lord will Bless Those Who Make Every Effort to Keep Themselves Free From Disease, and Lead Others to Regard as Sacred the Health of the Body as well as of the Soul."*** *- Ellen G. White, in "Testimonies for the Church", Vol. 6, 1901.*

Carl Jung Knew We Have A Soul, Knew There Is A God

"Carl Jung, he realised that your psyche has a need for the sacred, and the religion. And he said, if you don't have that, if don't a connection to that, that you will project it outward. And that's exactly what happens.

So, you know, liberals, the people I know in Hollywood, they are not spiritual, religious, and so they turn science into a religion.

They turn Dr Anthony Fauci into their deity, and so you can't question it, you can question religion, you're a heretic, so you can't questions science.

Don't do your own research, don't read the Bible, and I saw it happen right in front of my face. **Carl Jung knew we have a Soul, knew There Is A God**, which Freud was totally against all that. Freud was afraid that people would not take them seriously and dismiss them as mystics. And Jung wasn't, **Jung had mystical experiences. He had direct experiences of the divine. He knew he had Direct Experience.** If you read "Memories, Dreams, Reflections" 1961, he talks about it.

> ***"A Book of mine is always a matter of fate. There is something unpredictable about the process of writing, and I cannot prescribe for myself any predetermined course. Thus this "autobiography" is now taking a direction quite different from what I had imagined at the beginning. It has become a necessity for me to write down my early memories. If I neglect to do so for a single day, unpleasant physical symptoms immediately follow. As soon as I set to work they vanish, and my head feels perfectly clear."*** *- Carl Jung, in "Memories, Dreams, Reflections", 1961.*

Look Inside And Know Thyself

I have been going inward.

Jung says:

> ***"He who looks outward, dreams. He who looks Inward, Awakens. Your visions will become clear only when you can look into your own heart."***

And so I have a direct connection to the divine. I've had numinous experiences.

A numinous experience is a sacred spiritual happening, that happens to you.

And it takes you over. I experienced that like when I quit smoking. I felt like there was some outside force telling me to do it. And it was hard.

I was at least 6 months before I could sleep and it was horrible.

I was in bad shape and I just knew I had to quit. I just had this outside, I felt there was something guiding me to this. So I did. And, you know, your dreams are your psyche, or as Jung would call it, the "self" with a capital "S", meaning, you know, the divine talking to you, and speaking to you in Symbols.

And we share a collective, so you have a personal unconscious.

The things that you personally split off from, your own personality and put in your unconscious and your shadow.

Collective Unconscious

And then you have a Collective Unconscious, which Joseph Campbell also talked about. And my first entrée into this was Joseph Campbell, he talked about how different societies who had no way of connecting with each other use the same symbolism to explain life and the spiritual Literally.

One Consciousness

Jung figured that out t**hat we have a Collective Unconscious, meaning there's only One Consciousness.** So, there's not your consciousness, and then God-conscious. **There's just One Consciousness, and we are part of it.**

And the fact that you think you are separate from it, is a mistake.

And so, we are a part of that. **And as we evolve our consciousness, we evolve the world's consciousness. Because we all share a Collective Unconscious.**

And **one of the ways he figured it out, was that he would have dreams, and there would be symbols in his dreams. And he didn't know what they meant.**

But he could tell that they were meaningful. So he had figured out what some of these symbols meant, and he saw them right about the symbols that he was seeing in his own dreams.

So he started to figure out, that **We All Share A Consciousness; That There is One Consciousness.** So it's pretty heavy glimpses of that, I think occasionally.

People in the course of daily life, get just a flash, that, somehow; **There is a Connection Between All Peoples.** It is like, we are hairs on the human head thinking we're separate. They are all; **you are all part of the same head, you are all part of the same body. We Are All A Part of the Same Consciousness.** There is only One. And we have split ourselves off from it. We split that into our own conscious. And if you go into your own conscious; and one of the great ways is to go into your dreams, and see what they are saying to you; and treat it, for: What you seek, seeks you. And so the more attention you pay to your unconscious, the more it will rise up to meet you.

And so I have had numinous experiences, I have experienced the divine, I have experience my encounters with archetypal figures in my dreams that have guided me. After quitting smoking my dreams, they became way more vivid and more often. And so it's been a real awakening. **And I realised that I am not separate from the divine. I realise that I am not this body, that I have an eternal soul. And even though this body dies, that I don't die. That death is not the opposite of life. Death is the opposite of physical birth. Life has no opposite. It's eternal. And so once you realise that, that changes a lot of things. It changes how I look at everything. I look at the Oneness of Everything. I look that this isn't permanent. This body is not permanent.**

That I have an everlasting soul, that I have to pay attention to. That I need to get in touch with. And it fills my life with real meaning. People think they need a priest, or they need a preacher, or a church, which is all good. **The Community Is Good,** but you don't need them, because **you already have a connection to the divine within you.** And that's where you need to go. And once you realise that, then you don't need them. That's why they don't tell you about that.

And Jesus said that:

> ***"The kingdom of God is within you." - Luke 17:21***
>
> ***"The works that I do shall he do also; and greater works than these shall he do." - John 14:12***

And people they don't need you to know that, which is why they get rid of the parts of the Bible that talk about that kind of thing. I was an atheist, I thought this was it. This is it! And when you are dead, you're dead! And, now I realised, no!

It usually starts with a big dream, so I had this dream I was kneeling down in front of my house, in front of the bushes, I had a fish hook on a string. And I was drying it through the dirt in front of my bushes. And in my dream, I am thinking: What am I doing? What am I looking for? And then I saw underneath the dirt, I saw it start moving, like if there was an animal underneath. And I was like, what the heck? And all of a sudden, this black cat emerged, and it was all grimy, and it had an oil-like substance on it. And I am like, how could it be even breathing?

How could it be under there for so long, and not be dead?

Then it got up, and walked around. I'm, like, well, It's alive and willing.

And so, I knew that meant something, I didn't know what. I sought out, and I started reading Carl Jung. And so that was, you know: What you seek is seeking you. That was the divine, the unconscious telling me, you are ready. You are ready to go into your darkness. You are already go into your shadow, you are ready to go in to your unconscious. You don't know what you are going to find there. And it's probably going to be scary, and you don't want to find it, but it's there, and it's ready for you to now take the next step in your conscious evolution.

And so here I am, and I am doing it. I was an atheist. I didn't know.

I asked Carl Jung, is there a God? Do you believe in God?

He said: **"I don't believe I know, because he experienced God from 1913 to 1917."**

[Carl Jung famously stated: **"I don't need to believe, I know"**, during a 1959 BBC interview, **referring to his Direct Ppsychological Experience with the Numinous Forces of the unconscious**; a journey that peaked during his intense personal crisis between 1913 and 1917. For Jung, **"knowing" meant experiencing a psychological reality so powerful that conventional faith became completely unnecessary.]**

I have described it as he could give himself a psychedelic trip in a way.

He could somehow consciously access his unconscious. He could meet the archetypal figures in your unconscious, your anima. **If you are a male, Your soul, he would say, is your anima, which is your female, your feeling function.**

It's real, and it's autonomous and it is in your unconscious. And if you are a female, it's your anima, which is the male counterpart.

[The Need For Polarity: There is no Electricity Flow without Polarity. Current consistently flows from a point of higher potential to a point of lower potential (or, microscopically, negatively charged electrons flow from negative to positive). You need this polarity difference to create the "push" (voltage) that drives the current.]

And so he encountered these figures in his dreams, and I have encountered some of them.

So, I had one of those experiences, it was scary to, it is scary to go into your shadow, and the things you hate about yourself that you realise you've been projecting out to other people. Yes. And so, the idea is that we are going to be able to do that. That's so familiar to anyone who is self-aware. We all do that.

So the idea is you make it conscious, this darkness, this part of you that you hate, you make conscious, and you integrate. You don't judge it because it's also positive in a sense. And you integrate it into your conscious mind, so you don't have to project it on anybody any more. And your consciousness is raised.

So that goal isn't to become a better person, the goal is to become more whole person, and not split off from who you are.

And so that is to me the goal to be, to make the unconscious conscious integrated. And even though you might think it's a bad part of yourself.

But you need that part. **You need to able to set boundaries.**

But you need to aware that where it's coming from, so it doesn't come out sideways, and wreck your life. The idea, is to become whole.

And most people don't do it. It's hard work, because you don't want to see.

And a lot of guilt comes with it, right, because because you find out that in your past, you have done things that hurt your soul, and you feel guilty about it.

And I have had that right where I have realised through my dreams that I've prioritised career, or material possessions over my own soul.

And the overwhelming guilt that I felt in my dreams, and Jung talks about this, that part of becoming conscious is being able to handle guilt.

And I just, I was like, Oh my God.

And so it's people don't want to do this work because it's painful.

[Carl Jung believed that accepting and processing guilt is essential for the lifelong journey of becoming a whole, conscious person; a process he called individuation. Rather than a paralysing burden, he saw conscious guilt as an indispensable tool for moral development, self-awareness, and personal growth.]

> ***"Consciousness and Becoming Conscious Consciousness is the divine light; it is the possibility of seeing oneself, and this means to me that it is the very basis of life. We must sacrifice everything and become again as a child; not to remain a child, be it understood, but to re-enter childhood. This state implies a divinely transformed nature, a higher level of existence, and a more profound realization of the world. Consciousness is only possible if a spark of the essence becomes detached from the unconscious, religiously one could say from God. Consciousness is obviously the supreme quality: the destiny of the world is to achieve entry into human consciousness. Man is the being God has sought not only to show him the world, but because the Creator needs man to illuminate his creation. We must become conscious for God because, through us, God becomes conscious and then becomes man."*** *- Carl Jung, on Consciousness and Becoming Conscious, in "Conversations with C.G. Jung", 1964.*

Jimmy Dore - They don't teach this, they teach Freud because it's easier.

Tucker Carlson - And it's materialism. They don't get it.

Jimmy Dore - They don't teach Jung, Carl Jung **was about, your soul, and your religious experience, your numinous experience, the encounter with the divine, and if you don't have that, you're going to project it.** Just like people did during the "Covid Pandemic."

Tucker Carlson - **It does seem, there is a concerted, organised effort to eliminate any consideration of: The Transcendent, The Eternal, The Divine from People's Consciousness. Like it's never mentioned, it's considered a crackpot, even to talk about that. The idea that there is a world, that we can't see, that is meaningful, that we are connected; in any way other than physically. I mean, I don't think there's ever been a society as determined to deny the Eternal as ours.**

Jimmy Dore - Bill Donahue, he talked about that. Everybody says they believe in spirits, the Lord, the Holy Spirit, and angels. And then, when they show up; you're like, oh, it's crazy. And I was like, yeah, that's exactly what they do. But just don't forget; **The kingdom of Heaven Is Inside You. It's not outside you, it is inside you.**

Tucker Carlson - When did this come to you?

Jimmy Dore - It was right before the "Covid Pandemic". When "Covid" started, I had that big dream, and then I started to go into my unconscious.

Tucker Carlson - Do you notice people around you starting to ask questions, having thoughts like this? It does feel like more people are thinking about it.

Jimmy Dore - **I have noticed, I think people need community. But too often, it's about control, and that you need to get to God, you need to come through me. Which is, you don't need anybody. You have a connection to the divine, and it's inside, it's not external.**

Tucker Carlson - Everyone feels that on some level; it's just kind of weird speaking of the collective consciousness that a lot of people I know, more than 10, started having thoughts like this, right around or just before "Covid." Almost like people were being prepared for what was coming, and gaining a new vocabulary with which to explain it, and understand it. People who had never thought about anything like this at all, who were totally wrapped up in material concerns, accumulating wealth, succeeding at work, just whatever, what we are trained to do. A lot of people I know, all of a sudden, are like, praying! Maybe that's a real thing. Maybe I should listen to voices whose sources I can't see. Stuff like that.

Jimmy Dore - Carl Jung realised at a young age that he had thoughts, that he didn't think himself, that it was placed in his head by God, and **he had direct experience with God. And so I have had those experiences, and not only do I experience God in my dreams! But I realised that everything is a reflection of God. Everything is God in in my conscious life, and my unconscious life. God is everywhere, everything. The Kingdom of Heaven is laid upon the earth, but the eyes of men don't see it. So it's now, now is the time to meet God, to know the divine, and to know your true identity.** I had several dreams that completely changed my life. One of them, at the beginning, I was scared, of this journey. And I was in the jungle, were there was a clearing in the jungle, and I was sitting there, and out from the jungle came this half human, half ape, but the head was like a lion. And it came over to me, and it put his hand out, and I like oh, it's going to crush me. I am afraid it's going to crush me, but it took my hand very gently. And walked me into the jungle. And I am like, what the hell is this, you know. And a couple of weeks later, I am reading a book, and there was that symbol, that lion face, the half face. I was like what? And that's called a Mithraic god. And so that's part of the collective unconscious. That's like this archetype that we all share in our collective unconscious, we are one consciousness that we share. And I was, oh my God. And so I interpreted that to mean that, it's okay. It's going to be safe to go into the jungle of your unconscious, and **I will be there with you, to help you and guide you.** I know people think you are crazy when you talk about this stuff.

Tucker Carlson - Yes, on one level for sure it's forbidden. It's way more forbidden than criticising the State of Israel. I mean, this is the actual, it true though. **This is the actually third rail, I think, is to admit that you've had experiences with the divine or with a realm that is not physical or people are like, come on now. But everyone knows it's true."** - in "Tucker Carlson Show", 5 June 2026.

There Is A Realm Outside of What Is Possible to Measure

"I think that every culture, from the beginning of time has understood that except ours, that There Is A Realm Outside of what is Possible to Measure.

"Science", it can't be quantified in a laboratory, but that is every bit as real as anything that can be quantified in a laboratory. And it has an effect on human affairs, has an effect on the human heart, and that we are subject to it at all times.

God Also Intervenes In Our Lives

God also intervenes in our lives. And I think all of us have felt that too.

And we use different language to describe it, because we don't have theological language, because we are a secular society, to our great detriment. And I think one of the costs of having a committed secular society; a society that affirmatively rejects the possibility of anything that you can't see as being real.

One of the costs is not simply that it cuts you off from God, and therefore from eternal life, which I think it does, but it also makes you stupid, because you think you know, or can answer every question when in fact the most basic questions are unanswerable with "Science."

We don't even know what sleep is for. We have no idea what most of the brain does. We don't know anything actually.

We All Know The Truth In Our Hearts We Call It Intuition

I love human ingenuity. But what I hate is hubris, and the overstatement of knowledge or wisdom. And we greatly overstate ours, in part because we preclude the possibility of any Force in the universe smarter than us.

And so, when you make yourself god, you not only cut yourself off from the real God.

And you on some level know, because We All Know the Truth, in our Hearts, We Call It Intuition, or Instinct, but we know." - Tucker Carlson, in "Jack Neel Podcast", 24 June 2026.

Chapter 3

The Body Electro-Physiology

"This Work is Dedicated to the Educated Men and Women of the World, in the hope and belief that some of them, free from the shackles of Scientific Jealousy, and Unhampered by Medical "Ethics", will come forward and assist in the dissemination of a Great Truth."

The Electrical Aspect of the Human Body

"I would ask those gentlemen to remember that a great humanitarian question is involved and that while my personal opinion upon matters of detail may seem worthy of attack, **The Fundamental Truth I have put forward, 1st in "Electro-Pathology and Therapeutics"; 2nd in "Studies in Electro-Physiology" and for the 3rd time in the present volume is of too great importance to mankind to be passed over, or to be, to all intents and purposes, shelved, by saying there is very little that is new in it.**

One outcome of my research work has been Dielectric Therapy [Treatment modality for urolithiasis (kidney stones), based on the dielectric properties of the stones, it utilizes the dielectric nature of the stones to potentially disrupt them or interfere with their growth].

The use of a standardised paraffin [as a cathartic (please use vegetable base cathartic instead of a mineral base one], in the treatment of local Pyrexia (Fever).

There is abundant evidence to prove that by the use of this remedial agent Pneumonia can be deprived of its danger in a few hours, that it removes all Pain from Burns in a few seconds, and that as it does not interfere with metabolism it promises to displace the antiseptic method of treatment of Wounds.

If that is not new why, I ask, is there no mention of paraffin (cathartic) as a remedy for local Pyrexia in the Pharmacopoeia?

Many hundreds of physicians have had experience of its efficacy.

What I have endeavoured to do is to study natural processes, and to find out exactly what happens and how it happens, and I hit upon a line of research which has been productive of enlightenment.

It has enabled me to explain many things that were lacking of explanation and to view physiological problems from a new standpoint; to peer through the door opening into a hitherto unexplored field and to describe such things as I have been able to see.

Nor is it understandable why if physiologists are capable and experienced electricians they fail to tell us anything about **the Human Electrical System.**

The issue is a plain one: **If I am right then a brighter prospect opens for Humanity.**

Dr Geo. W. Crile, and I have no doubt, other able men are close upon the heels of the Truth.

In the present work I have attempted to give a consecutive **account of the Electro-Physiological processes concerned in evolution**, from the formation of the pollen grain to the completion of the structure of the young plant.

In regard to the other Studies in Electro-Physiology which help to swell the volume, I would point out that the thesis upon the Auditory Apparatus, opens up a, more detailed and reasonable theory of the operation of what has been called "the Mechanism of Hearing".

Students are taught that all vital functions are due to chemical action, and that kinetics play no part in the phenomena. And with what result?

Take any work upon Physiology, and what do we find?

The mechanism of hearing "further investigation of hearing is called for, the function of the Cochlea is imperfectly understood"; the eye, and so forth.

We are not told what causes voluntary muscle to contract; **what the force is that supplies the heart with energy during every second of our lives: what actuates plain muscle, how we see pictures and hear sounds, or why we sleep.**

As it is in animal so it is in vegetable physiology.

Admirable work has been done in Histology, Morphology and in Anatomy.

Those deal with things that can be seen.

The unseen remains for the most part: unseen.

While we all know that the human body is an organism of a much more wonderful nature than any engine invented by man, it is not supposed to be actuated by any motive power at all; or at all events, **no one seems to know what the motive power is, although common sense tells us it must exist.**

In the seed, in the plant, in the cell or cells from which all living things spring, the electrical structure is so clearly evident as to leave very little, if any, doubt as to the form of energy which calls them into activity, and maintains them and the chemical processes associated with them.

It is Chemical or it is Electrical; one or the other — when, clearly, it is both.

The theorist who attributes the performance of body functions to a force resembling electricity cannot but admit that the chemical reactions which accompany those performances are equally vital in their importance to life; he merely postulates that Neuro-Electrical Action is precedent to Chemical Change.

The human body is primarily formed for the exercise of Electrical Functions, but to sufficiently condense that proof.

Let us now consider **Ganglion Cells.**

There are 3 classes of these:

1. Unipolar Cells.
2. Bipolar Cells.
3. Multipolar Cells.

1. Unipolar Cells: The first of these are in association with the "closed" circuits of the sensory nerves only. They are really storage cells in a state of charge and their office is to maintain electrical equilibrium by "giving" or "taking" as the case might be, and to hold our store of reserve energy.

2. Bipolar Cells: Those of the bipolar type are condensers of higher capacity than synaptic junctions.

3. Multipolar Cells: are built up of a number of Leyden-jar-like rings, each of which is on a separate circuit and may be linked up with arborisations for the purpose of changing the sign of current where required.

As regards the vegetable world, let us, as we have done with the human body, go back as far as we can, to the beginning of things, and study the seed; selecting, for illustration, one with which we are familiar and which is large enough for its structure to be seen with the naked eye.

We will take an edible chestnut in its pod, for it is very similar in appearance to a foetus in the womb and for that reason more than ordinarily interesting.

In normal conditions of weather the air is the positive and the earth the negative terminal of Nature's electrical system.

Everything growing in the earth is negatively charged through the roots, stems and venation, and positively by the air through the aerolae (small circular area) of the leaves, so that in the roots, stems and venation the tree or plant has its negative and in the aerolae its positive terminals.

There is, in fact, an ordinary electrical circuit, i.e., air to earth, and earth, through the plant, to air.

It is well-known that the vegetable cell is practically identical with the animal cell and that the phenomenon of division or reproduction is common to both.

In at least one respect **a seed does not differ from either vegetable or animal cell, i.e., it is a potential Leyden-jar.**

Before the seed can germinate its substance must be continually and adequately electrified.

Why, then, cannot it germinate while in its pod?

I have remarked that **the tendency of seed electrification is to mature or advance the development of the embryo**, but when we ponder the application of electricity to horticulture and agriculture the first and most important thing to bear in mind is Nature's own method.

The air is the positive and the earth the negative terminal of the natural electrical system, and the current is continuous, not alternating.

Positive air and negative earth mean that there is, in normal conditions of weather, a downward driving force, with a return through the roots, stem and venation of the plant; the aerolae of the leaves taking in Oxygen — plus air electrification and light energy to stimulate them to growth.

There is convincing evidence that cell division is an electrical rather than a chemical phenomenon. It is necessary to remind that the air is the positive and the earth the negative terminal of Nature's Electrical System.

Electrical circuits are of 2 kinds, i.e., "earth return" and "metallic."

In the former one pole of the battery at each end is connected with the earth; in the latter with a second wire.

That, I take it, is understood.

In the natural circuit the negative terminal is necessarily "earthed" because it is the earth itself.

To complete the circuit the plant or fruit must have access to the positive air.

In trees and plants this is gained through the stomata of the leaves, while in fruits the flower end (whether the flower is decayed or not), is never quite closed." - Arthur E. Baines, in "Germination in its Electrical Aspect", 1921.

The Science of Electro-Physiology

"From the article "The Human Body as a Disturbing Element in Electrical Testing":

> *"I am of opinion that in every case where use is made of an unshunted galvanometer of great sensibility* ***the operator should be careful to connect himself during the test with an earth plate, instead of, as is usual, standing upon some insulating substance. This conclusion was forced upon me years ago."***

The article attracted the notice of Dr Stone of St. Thomas's, a correspondence resulted, the preparation of his Lumleian lecture the subject being:

"The Human Body Considered as an Electrolyte."

Although working in different sections of the field of scientific investigation, we had both arrived at one conclusion, viz., that local Pyrexia (fever; a raised body temperature), interfered with local insulation resistance.

We know, and at all events it can be demonstrated, that **Man Is A Self-contained Neuro-Electrically controlled machine, dependent for the due performance of his functions upon a constant supply of nerve-energy at a low potential;**

that nerve-force is generated in the body with each inspiration, and that the nerve-impulse is Neuro-Electrical, and not chemical.

It may reasonably be assumed that in all probability electricity plays a part in the vegetable as well as in the animal world.

Investigation has shown the soundness of this theory, as I hope to be able to prove, and further research at the hands of men more capable than myself may lead to far-reaching consequences in the direction of an advancement of our knowledge of practical horticulture and floriculture.

The conclusions arrived are as follows:

1. Everything living, whether animal or vegetable, has a well-defined electrical system; the non-living possessing capacity only; and that only in conjunction with moisture.

2. The edible part of a fruit or vegetable is the positive element, or that part which yields a positive galvanometric reaction.

3. Dry earth is a bad conductor of electricity, and therefore **water is required as an electrolyte as well as being necessary in the formation of protoplasm**, etc.

4. Every tree, shrub, plant, fruit, vegetable, tuber, and seed is an electrical cell, differing from cells made by human agency in that it cannot be polarised or discharged so long as it remains structurally perfect.

5. The skin, peel, rind, or jacket of fruits and vegetables is of the nature of an insulating substance primarily designed for the conservation of their electrical energy.

6. The Electro-Motive Force of them all is the same; the current varying in accordance with Ohm's law.

7. Plants grown in pots, or removed from the earth and placed in other receptacles different materially in their electrical constitution from those grown in the earth.

8. If a suitable electrolyte, other than water, is, mixed with the soil it is possible to grow plants with much less moisture.

9. Growth may be stimulated by means of a continuous current of electricity of low potential, and proper sign.

Neuro-Electrical System: Nerve-Force

Physiologists have all failed to recognise, from their own works, that **the structure of the body is primarily electrical.**

If it is so one cannot be surprised, in the absence of such recognition, that the practice of Electro-Therapeutics is empirical.

A necessary preliminary to curative treatment is knowledge of the human Neuro-Electrical System; the generator or generators of Nerve-Force, the natural conductors and dielectrics, the condensers and storage cells and their capacity, and, what is of paramount importance, the influence of disease upon any or all of them.

Until that knowledge is acquired treatment cannot be said to rest upon a scientific basis.

To the careful observer the structure of the human body must appear to be primarily electrical, and to be designed for the performance of electrical functions, not necessarily outweighing in importance those chemical changes which are essential to life, but taking precedence of them.

In the human body the velocity of the nerve impulse is not everywhere the same, nor could it be so unless the inductive capacity was uniform throughout, and this, obviously, is not the case.

Retardation, or the portion of the current retained upon the surface of the wire, is also dependent upon, among other things, the length and diameter of the wire or, in other words, upon its resistance.

And here note should be taken of the fact that the effect of capacity is to produce prolongation at the end as well as retardation at the commencement of a current; so that a current takes longer to leave the line than it did to enter it.

In the human body neither the resistance of any given circuit nor the same difference of potential can be maintained owing, quite apart from disease, to variations of external temperature and the fluctuating nature of the human electromotive force; and the fact is emphasised that in the estimation of body deflections we must have a fixed point of departure, and that that point should be upon the central line.

Hand-to-Hand Deflection and Thumb Pressure

The importance of the hand-to-hand deflection, as being the measure of the electromotive force exerted in the body at the time of testing, is fully treated in the chapter upon Ohm's law and Electro-Diagnosis, but it may serve a useful purpose to explain what happens when there is inequality of pressure of the 2 thumbs.

The body is connected in the galvanometer circuit by means of 2 suitable metallic electrodes, grasped in the hands, and a certain deflection is obtained.

The thumbs carry a greater quantity of current than the fingers, so that if one is pressed harder than the other the deflection is altered, while if one thumb is relaxed and the other pressed down there may even be a reversal of sign, because the direction of current is determined by the path of least resistance.

In my work upon **Electro-Pathology and Therapeutics**, I stated that **the thumb of each hand was of opposite sign to the fingers of each hand and carried a greater quantity of current.**

Dr Martin's letter upon **"The Source of Body Energy and its Relation to the Nervous System",** says:

> *"The Theory of Neuro-Electricity, Galvanometric Tests, and Treatment, founded upon the theory propounded by Mr Baines, has proved of Value in the Treatment of Certain Conditions of Disease. Digestive Organs, Nervous System, etc., are present, but are functionally in abeyance till the act of birth has taken place.*
> *What, then, is the difference?*
> ***It is the act of breathing which determines the separate existence of the child from the mother. Before this act has taken place the lungs contain neither blood nor air.***
> ***Their function could not be called into play until the need arose to Link up the Life, with Its Future Source of Energy. The Act of Birth, therefore, Brings with It the Power to Use a Mechanism by means of which the Oxygen in the air, can be Used by the Body.** From that moment the whole of the latent mechanism is in working activity and the individual life is complete. **The whole arrangement of the Nervous System, nodes, synapses, medulla, sheath, ganglia, etc., points to an Electrical System** with many makes and breaks, shunts, etc., and we have shown before that the Fundamental Energising of the Body is an Electrical Phenomenon. Returning to the blood-stream and for the moment leaving out the specialised organs and glands, we come to the question of connective, fibrous, and elastic tissues. Subcutaneous and other vascular connective tissues may be regarded as the padding of the body. **We have a multitudinous cell-life, vascularity, and a controlling nerve supply.** Here, then, we have a storage of energy separate from the closed circuit of the nervous system; closed in relation to the other tissues of the body. **In this tissue, as in the specialised organs, the interchange from blood to cell goes on,** but in this case we get some diffusion through moist tissues and only partial insulation by the skin. This no doubt gives us the average reading on the galvanometer scale of ordinary normal deflections, except in the case of the finger-tips and toes, which give constant readings and are probably the earth (air) outlets of the nervous system. At the finger-tips, no matter how dry the skin may be, we are always able to measure a current. Also reversal of sign is obtained from hand to hand and from the thumb to the fingers of the same hand. With other portions of the skin over the body a comparatively dry condition will lead to no current being obtained, while **moisture will produce a current equal in Electric and Magnetic Fields at any part."** - Dr Martin*

In the human body none of the conducting plates, discs, or points are of large area, but while no considerable variation of capacity is possible by this means, Nature can, and apparently does, overcome the difficulty by approaching the conductors closely to each other, as in striated muscular fibre, and by connecting them sometimes in parallel.

In other parts of the body structure (in various arborisations, for instance), there must be differences of capacity and resistance, and therefore **velocity of current or Nerve-Impulse cannot be uniform throughout the whole of the Nervous System.**

Only from the "living" can any reversal of sign, implying an electrical system, be obtained.

In the "non-living" there is no difference of potential unless introduced by some exterior vehicle of energy.

Every plant that grows in the soil has a nervous organisation.

The earth is the negative terminal of Nature's Electrical System, as the air, in normal conditions of weather, is the positive terminal; and every tree, plant, or vegetable is charged by the earth, through sensory nerves, or closed circuits, extending from the roots through the stem and stalks and thence to the veins (nerve-fibres or fibrillse) of the leaves.

These all yield a negative galvanometric reaction, while those parts of the leaves between the veins, as well as the flower end of all vegetables and fruits, are of positive sign. **Not only have plants nerves, but I shall be very much surprised if they are not found to possess a lower form of motor apparatus as well.**

With special reference to the velocity of the nerve impulse the experiments of Dr Le Bon are of importance. He came to the conclusion that electricity is able to propagate itself in insulators as well as in conductors, but much more slowly in the first case than in the second, the velocity varying from a few centimetres to 300,000 kilometres per second. In the enormous margin between the two there is ample room for speculation as to the causes which contribute to the comparative sluggishness of the human nerve-current.

The same authority showed that the particles emitted by an electrified point were identical with those which came forth from radium; suggesting, by inference, that the force known as electricity may be made up of more than one form of energy.

Cardiac Muscle

The structure and precise functioning of cardiac muscle; several facts, stand out prominently:

1. Is intermediate in structure and properties between voluntary and involuntary muscle;
2. Contracts more slowly than ordinary striped muscle;
3. Is striated (marked with long, thin parallel streaks);
4. Has no true sarcolemma: "although there is a thin superficial layer of non-fibrillated substance." - Schafer.

Considering, as we must do, each segment as a sarcomere (the smallest functional unit of striated muscle tissue), it will be seen that the segments differ in length and in diameter (permitting of infinite variation of tension); that some are non-nucleated, and that there are branch, or shunt, circuits which no doubt play their part in the inductive regulation of tension in an **Automatic Neuro-Electrical System**, because, although the heart's action may be subject to psychological influences, it must be supplied, from within or without, with energy unintermittently, and therefore must form part of an automatic system.

And here, we may begin to appreciate the beautiful regulation exercised by the Vagus Nerves. The energy, partly self-contained or not, which, in life, is constantly supplied to the heart, is by way of the sympathetic, while the vagus nerves are inhibitory, or, in other words, exert a governing or opposing electromotive force. They are buffers, or springs, regulating the flow of energy to the heart, much in the same way that a rise or fall of temperature may regulate the fall or rise of a gas-flame in a heating apparatus. **I am convinced that when the nervous system is studied on electrical as well as chemical lines and in relation to Ohm's law, a great advance will be made in our knowledge of the human organism.** There are in the human body many structures and substances which, although not in themselves of very high resistance, may, in view of the low tension of the nerve-current, be termed Dielectrics (a material poor conductor of electricity, but an efficient supporter of electrostatic fields). Among these are the sheaths of medullated and the lipoid coatings of nonmedullated nerves; the capsules and membranous coverings of and in cells; the sarcolemma (the fine, delicate, extensible membrane surrounding each muscle fiber), and neurilemma (thin sheath around a nerve axon); Krause's membranes of voluntary muscular tissue, neuroglia processes and connective tissue, etc. **The effect of heat upon any and every known dielectric is to lower its resistance.**

On Disease in General

In connection with Electro-Diagnosis I have postulated that any physical change in the body must be attended by a Neuro-Electrical change, which can only be galvanometrically detected; and that the process of restoring the one to normality tends, automatically, in the great majority of disorders, to restore the other to normality. **Disease is a deviation from the state of health, implying some alteration in the functions, properties, or structure of some organ or tissue, and may be generally described as an abnormal performance of the processes constituting life. That being so, it would be illogical to imagine that one of the most delicate and most necessary of those processes, i.e., the maintenance and regulation of the Neuro-Electrical System, could proceed without deviation in any diseased area. In Electro-Diagnosis and body-testing generally the patient must be connected for some minutes with an "earth" of low resistance in order to remove any possibility of charge from a source of energy other than that of the body itself, and if this is to be accomplished it follows that the tension of the body must be plus and that of the earth minus, otherwise there would be a transfer of electricity from the earth to the body instead of from the body to the earth.**

The human body is liable to be influenced not only by being placed in an earth circuit but by induction; its normal electromotive force of 4 or 5 millivolts can only be a plus quantity in favourable circumstances.

Neuro-Electrical System

Considering, as we must do, each segment as a Sarcomere (the fundamental structural and functional unit of striated muscle tissue; skeletal and cardiac muscle), it will be seen that the segments differ in length and in diameter (permitting of infinite variation of tension); that some are non-nucleated, and that there are branch, or shunt, circuits which no doubt play their part in the inductive regulation of tension in an automatic Neuro-Electrical System, because, although the heart's action may be subject to psychological influences, it must be supplied, from within or without, with energy unintermittently, and therefore must form part of an automatic system.

And here, we may begin to appreciate the beautiful regulation exercised by the Vagus Nerves. The energy, which, in life, is constantly supplied to the heart, is by way of the sympathetic, while the Vagus Nerves are inhibitory, or, in other words, exert a governing or opposing electromotive force.

They are buffers, or springs, regulating the flow of energy to the heart.

Disease is a deviation from the state of health, implying some alteration in the functions, properties, or structure of some organ or tissue, and may be generally described as an abnormal performance of the processes constituting life.

That being so, it would be illogical to imagine that one of the most delicate and most necessary of those processes, i.e., the maintenance and regulation of the Neuro-Electrical System, could proceed without deviation in any diseased area.

Neuro-Electrical Equilibrium

From an electrical point of view some Ganglion Cells are condensers and some storage cells, but this statement calls for elaboration.

In telegraphy; and the brain, it is necessary to remember, both sends and receives messages; one of the functions of a condenser is to maintain electrical equilibrium, and, when required, to change the sign of current; whereas the function of a storage cell is to receive a charge and to hold it until some disturbance of Neuro-Electrical Equilibrium calls for its delivery, either wholly or in part. In this connection let us consider ganglion cells with a view to attempting to differentiate the condenser pure and simple from the storage cell.

Condenser-ganglion cells should be studied more especially in relation to the sympathetic system, the nodes of Ranvier and the structure of the muscles, bearing in mind not only the change of sign, i.e., from downward to upward current, or from efferent to afferent, but control of regularity of supply.

Assuming there to be, for instance, a flow of nerve-energy of a certain potential from the brain along, say, the sympathetic, the current strength would vary with the resistances in circuit in obedience to established laws, but it might be necessary to regulate both current strength and sign at different points of the circuit.

PCC = small cells at the base of the posterior cornu.
ACC = large motor-cells of the anterior cornu.
M = muscular fibres.
PF = axon.
CC = cell of the cerebral grey matter.

aa = low-tension condensers.
bbb = high-tension condensers.

In this light we may ponder several forms of spinal ganglion cells, showing the cell bodies, the afferent sensory nerves, and the dorsal roots.

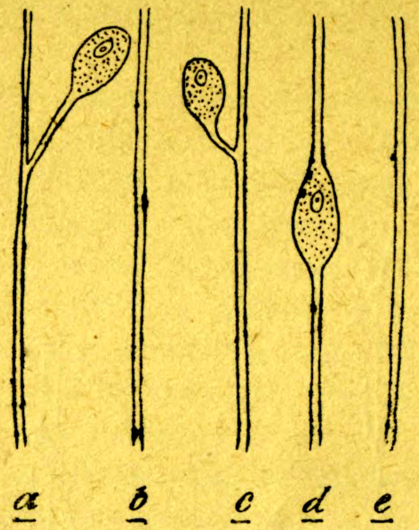

Fig. 108. (*After Landois and Stirling.*)

To my mind a, c are nerves carrying storage cells, which would hold their charge unless and until excessive mental or physical exertion had disturbed Neuro-Electrical Equilibrium in the sense of bringing about a subnormal local or general body potential, while b and e are simple closed circuits, and d a nerve carrying a condenser. Perhaps this view may throw some further light upon the subject and help us to a better appreciation of the functions of ganglion cells.

It must be remembered, however, that the due functionment of both ganglion storage and ganglion-condenser cells is absolutely dependent upon the maintenance of their normal insulation resistance. Should the absolute insulation of the storage cell be broken down to any extent there would be defective storage, and if the resistance of the insulating membrane in the condensing cell were broken down or altered there would be a "fault." In works upon Physiology confusion is caused by the uncertainty which attaches to the meaning of the word "stimulus", "impulse", "irritation", and "charge" when applied to nerve cells, but if it be accepted that the natural impulse is neuro-electrical, and that the changes which take place in nerve-cells and processes are due to alteration of nerve potential, sign of nerve current, or variations of external or internal resistance, a clearer appreciation of the laws which govern the nervous system may be obtained. Now, it is quite obvious that if the organs of the body connected with the transmission of impulses, the maintenance of Neuro-Electrical Equilibrium, the conservation of energy, and the contraction of muscular tissue are to function properly, the temperature of every part of the whole organism must not exceed the normal, which we may take to be, subcutaneously, about 37.8° C.

Protoplasm dies, I am informed, at about 45.5° C., and as we know that cells do die in the area affected by acute inflammation, we have a right to postulate that, in that area, there may be a rise of temperature of at least -12° C. above the normal." - Gladys T. Baines, in "Studies In Electro-Physiology", 1918.

Nerve Cells and Nerve Fibres

"We may now consider nerve cells and nerve fibres in so far as they form part of the Neuro-Electrical System of man. Nerve or ganglion cells occur in large numbers almost solely in the brain and spinal chord. From an electrical point of view they are condensers and storage cells, and each one connects with a number of delicate fibrous processes which either communicate with other nerve cells, or pass through the body to end in some organ. The brain is the seat of the intellectual life of man. Volition and imagination; to quote from a recent work; and the processes of thinking and perceiving originate in the nerve cells and are dependent upon them. If all the nerve cells of the human body suddenly ceased to act, all intellectual life would come to an end at the same moment, but if only some of them were destroyed, only that part of mental activity which resided in the destroyed cells would be lost. There are also nerve cells whose only duty it is to preside over the functions of speech and so on. Nerve fibres are the continuations of the processes of the nerve cells. Their course is from brain and spinal cord, and they are really insulated wires carrying messages from the brain and spinal cord to the various organs of the human body. The brain may be regarded as the central station or departmental telegraph office, and the nerve fibres as the telegraph wires, which run from it to the smaller sub-stations; the organs of the body. The nerves and nerve fibres are classified according to the organs in which they terminate, as: Motor nerves; secretory nerves; sensory nerves; and herves of special sense. Motor nerves terminate in muscle. Before a certain muscle contracts **The Impulse to do so, originates In One or More Cells in the Motor Area of the Brain."** - in "Electro-Pathology And Therapeutics", 1914.

Bioelectricity And the Electrome

"The Nerve Impulse (the essential component of neuronal language), is nothing more than an "Electrical Impulse", which in Neuroscience is called an "Action Potential". Each "Action Potential" represents a computation, a combination of received signals whose result is binary: either there is a potential or there isn't; either there is a nerve impulse, or there isn't. These Electrical Signals, are the messages transmitted throughout the Nervous System to connect this vast network to every corner of our body. Sensory stimuli, such as: Temperature, Touch, Vision; are detected in our body by specialized receptors in the skin or organs and transmitted to the brain along nerve fibers that ascend through the spinal cord. But just as the electrical message originating from a prick in a finger informs the brain that we feel pain, it sends another message in the

opposite direction to order the finger to move away from the cause of the injury. Within the Brain, Nerve Fibers connect the Sensory and Motor areas so that a Two-Way Communication, Stimulus and Response, can be established. All these Nerve Fibers use Electricity. In the Nervous System, Electricity Is Generated From Ions, Not Electrons like household electricity. It Is of Lower Intensity, and travels at a Slower Speed. In 1780, the Italian scientist Luigi Galvani was one of the first to propose that Nerves, and Muscles Use Electricity to Function. Later scientists continued these investigations, culminating in 1952 when the British Physiologists, and Biophysicists Alan Hodgkin, and Andrew Huxley described the Ionic Composition of the Action Potential. By then, the small voltage changes that occur during nerve impulses had already begun to be recorded. Thus, it was determined that the conduction velocity of the nerve impulse along nerve fibers reaches a maximum of 27 meters per second, which implied that it could not be due to electron flows like in electricity, which flows at the speed of light. Other types of charges had to be responsible, and, the Most Abundant In Cells Are Ions. But what kind of Ions? Cells contain many types: Calcium, Magnesium, Potassium, Sodium, Chloride, and others." - in "Cerebro: Los secretos del órgano más complejo", 2019.

[Ions are essential electrically charged atoms or molecules in cells, categorized as positively charged cations or negatively charged anions, which facilitate critical physiological functions like cell signaling, nutrient transport, and nerve impulse conduction. **Key intracellular ions include: Potassium, Magnesium, and Phosphate,** while extracellular fluids are rich in Sodium, and Chloride.]

The Ionic Milieu

The German internist Friedrich Kraus, physiologist S.G. Zondek (and associate Theodor Brugsch) pioneered this concept in the early 1920's. They published foundational work "Die Allgemeine und Spezielle Pathologie der Person"

[The General and Special Pathology of the Person], 1924, proposed that:

The Body Internal Fluids Act as an Interconnected, specialised Ionic System (The IonenMilieu).

"This leads us, finally, to recognize the important influence which the Ionic State has on the functioning of the autonomic and sympathetic systems.

But the Ionic State itself only represents one aspect amongst many which determine the reaction. According to Friedrich Kraus and S. G. Zondek, the proper functioning depends on the establishment of a definite equilibrium between the electrolyte and colloidal particles. **Also, the cell wall potential, which influences the colloidal state of the cells, which in turn is so important for their activity, is, according to these investigators, dependent upon a great number of factors: on the cell membrane, the salt-electrolyte, the hormones, poisons, etc., and lastly, on the vegetative nervous system.**

General Interaction:
Reflex and Retroaction of Periphery on Nervous Center, and Vice Versa

Finally, **the facts compel us to acknowledge that all the numerous factors that have been isolated are really influencing each other. The more many sided the investigations are, the more they show the manifold interrelation of a multitude of factors influencing the Life Process. Of all these factors I wish to emphasize only the influence of the peripheral processes on the function of the central nervous system (stressing this influence).** We started by a consideration of the dependency of the peripheral processes on the function of central apparatus, and now **we have to recognize the converse influence. We know that this influence occurs partly through afferent nerve action, for example, the regulation of Breathing, and partly it takes a physical form, as in the regulation of temperature, or it may be of a chemical nature, and play an important role in: Circulation, Respiration, Metabolic Processes. We must further insist upon the relationship between vegetative and spino-cerebral processes, especially, the psychic processes. As Bruecke has particularly emphasized, probably all tissues of our body, not only the so-called viscera, are under the influence of the vegetative system.** We know this to be true with regard to muscle tonus, muscle metabolism, and also with regard to the sense receptors. When the vegetative system is influenced by drugs, changes are found in the chronaxie of the peripheral sense-organs. (Foerster, Altenburger and Kroll) Similar conditions were revealed in changes of the water metabolism and regulation of body temperature.

(Achelis) **The spino-cerebral system is probably influenced by processes in the vegetative system, just as they, in turn, influence the latter. Finally, recent research has disclosed an extraordinary number of facts that demonstrate a far-reaching interaction between vegetative and mental processes. It must be stressed that such a relation holds not only for emotional processes but also for sensory perception. Even the preparedness for Mental Performances in general shows more and more its Dependency on the Automatic Nervous System."** - in "The Organism: A Holistic Approach to biology derived from pathological data in man", 1934.

The Ionic State

Alfred North Whitehead, in "Science and the Modern World", 1925, stated that: The Electrons - The Ionic Milieu - Behave Within the Body In Accordance With the Purposes of the Body, i.e., The Mental States (p.99). Today we know that There Is No Such Thing As Two Identical Electrons. The reason is simple: it is not possible to delineate the entity we call electron. We do not know where it starts nor where it ends. The electron is the expression of a force in a field.

"Human beings are, in all aspects of life, developing organisms.

The most subtle reaction to our organic development is mental activity. Kraus answers the question of the connection between body and soul as follows:

All psychological processes are determined by physical parallels in the central nervous system. The physical parallel remains essentially functional, whether or not it leaves a material residue. Intelligence and Character are subjectively dependent variables of nervous processes. Nothing subjective directly interferes with the determinations of physiological processes.

The psyche is functionally dependent on the physical, unambiguously assigned to it. "Our organization requires no psychological and/or physiological explanation, but it can only be fully described as psychophysical."

Kraus's view of life as a whole, in accordance with Spencer, is that it is a

> *"Specific combination of dissimilar changes, both simultaneous and successive, in connection with external simultaneities and consequences, or also... an adaptation of the connection between internal and external relationships; the general pathology of the person, as we have always seen, is largely one of disturbed vital equilibria."*

Thoughts are not merely signs of sensations but "independent entities within the psychic correlates of the highest division of the central nervous system."

Even the conscious perception of psychic elements always corresponds to an unconscious physiological process, which is connected with other observable physiological processes. Mental processes are themselves indeterminate; only the physical organization can connect and separate them. States of mind, in themselves, have nothing to do with consciousness. Consciousness is merely a characteristic feature of present experience and activity. The unconscious is "not a by-phenomenon of psychic life, but rather its very essence"." - in "Münchener medizinische Wochenschrift", 2 January 1920.

"Science is taking on a new aspect which is neither purely physical, nor purely biological. It is becoming the study of organisms. Biology is the study of the larger organisms; whereas physics is the study of the smaller organisms.

An Electron Within a living body is different from an Electron outside it, by Reason of the Plan of the Body; but it Runs within the body in Accordance with its Character Within the Body; that is to say, in accordance with the general plan of the body, and this plan includes the Mental State. But the principle of modification is perfectly general throughout nature, and represents no property peculiar to living bodies. In subsequent lectures it will be explained that this doctrine involves the abandonment of the traditional scientific materialism, and the substitution of an alternative doctrine of organism. The fundamental principle is that, whatever merges into actuality, implants its aspects in every individual event. Further, even for self-cognition, the aspects of the parts of our own bodies partly take the form of aspects of shape, and of sense-objects.

But that part of the bodily event, in respect to which the cognitive mentality is associated, is for itself the unit psychological field. Its ingredients are not referent to the event itself; they are aspects of what lies beyond that event.

Thus the self-knowledge inherent in the bodily event is the knowledge of itself as a complex unity, whose ingredients involve all reality beyond itself, restricted under the limitation of its pattern of aspects. Thus we know ourselves as a function of unification of a plurality of things which are other than ourselves. Cognition discloses an event as being an activity, organising a real togetherness of alien things. But this psychological field does not depend on its cognition; so that this field is still a unit event as abstracted from its self-cognition. Accordingly, consciousness will be the function of knowing.

But what is known is already a prehension of aspects of the one real universe.

These aspects are aspects of other events as mutually modifying, each the others. In the pattern of aspects they stand in their pattern of mutual relatedness." - Professor Alfred North Whitehead, in "Science and the Modern World", 1925.

> ***"And conscious, percipient acts are parts of the environing actuality of every act in Nature. So we see that no concrete happening or act or process is without private, internal tone or without public imprint. The essential in life is originality and creativeness."*** *- in "The Philosophy of Alfred North Whitehead", 1941.*

> ***"When we refuse to get in line with nature, as registered in the faulty purposes of life - i.e., our mental states - even the kidneys, the blood pressure and urea, proteid, ionic milieu become involved and this is but one formula for many diseases."*** *- Dr Smith Ely Jelliffe, MD, in "Sketches in Psychosomatic Medicine", 1939.*

The Nature of Mathematics
Its Unity and Internal Structure And Its Applicability to Nature

> ***"The object of the following Chapters is not to teach mathematics, but to enable students from the very beginning of their course to know what the science is about, and why it is necessarily the foundation of exact thought as applied to natural phenomena."*** *- Professor Alfred North Whitehead, in* ***"An Introduction to Mathematics"****, 1911.*

> ***"We are now approaching the limits of any reasonable certainty in our scientific knowledge; but again there is evidence that the concept may be mistaken. The mysterious quanta of energy have made their appearance, derived, as it would seem, from the recesses of protons, or of electrons. Still worse for the concept, these quanta seem to dissolve into the vibrations of light."*** *- Professor Alfred North Whitehead, in "Process and Reality", 1929*

The Electrome

"Hodgkin and Huxley's work on voltage changes along neurons during an action potential earned them the Nobel Prize in 1963.

Bioelectricity opens the door to numerous treatments.

Our organism is so complex that it also comprises other "-omes", such as the proteome, the exome, the metabolome, and the Microbiome.

Moreover, all these "-omes" interact with each other.

These "-omes" (a Greek suffix meaning: **collection, cluster, or biological structure), include the Electrome**.

In the 18th and 19th centuries, we began to truly understand and control electricity. The work of Luigi Galvani, an Italian physician and physicist, involved experiments with frogs. Galvani noticed that when electricity was applied to the muscles of dead frogs, they contracted as if they were alive.

Galvani theorized that this was due to what he called "Animal Electricity", a form of vital energy he believed flowed through living beings.

Galvani's experiments, in which he claimed to have **discovered "hidden electricity in the nerves"**, were to have a significant impact, marking a turning point in scientific research.

These experiments, along with subsequent ones, led to the development of new areas of research surrounding Electricity, as well as the eventual invention of the Electric Battery by Alessandro Volta, who was directly inspired by Galvani's work.

Finally, the invention of the electric battery ended the focus on and conceptualization of electricity itself: it was no longer seen so much as a fluid linked to biology as something that allowed machines, all kinds of chemical reactions, and other non-living elements to function.

Gradually, **Electricity has acquired a major role in all biological processes** in general.

Following the experiments of Emil du Bois-Reymond, a 19th-century German physiologist, who made important contributions to the field of **Bioelectricity by demonstrating that an Electric Current Flows Along Nerves** when they are active, the next major milestone in bioelectricity came in the 1950s, when physiologists Alan Hodgkin and Andrew Huxley succeeded in measuring changes in voltage along neurons during an action potential and developed a mathematical model to explain these changes, work that earned them the Nobel Prize in Physiology or Medicine in 1963.

It had already been established that **neurons communicate through electrical impulses, and that muscle cells contract in response to electrical signals.**

Furthermore, the heart contracts according to a coordinated sequence of electrical activity that can be mapped using an Electrocardiogram. **Similarly, brain electrical activity can be mapped using Electroencephalography. It also began to be demonstrated that these processes play a fundamental role in both brain development and repair, and that they are involved in all cognitive functions, from learning and memory to sensory and motor processing.**

Unlike conventional electricity, which comes from the manipulation of electrons in a conductor, such as a copper wire, **Bioelectricity is generated differently: through the Ions present in our bodies, such as sodium, potassium, calcium, magnesium, and zinc. These Ions attract and repel each other, generating a current that propagates throughout our bodies. Although this current is very weak (barely 70 millivolts, compared to 1500 millivolts in a common AA battery), it is essential for communication between different parts of the body.**

Although the body electrical current passing through a cell may be tiny compared to the current powering an electrical appliance, the relative voltage is enormous due to the minuscule thickness of the cell membrane. If this voltage were scaled up to the size of a human being, it would reach up to 10 million volts.

All the cells and tissues in our body use the same process to communicate, including neurons, nerves, muscles, cartilage, and the gut. Even the microbes in our gut and cancer cells generate electrical signals. In a broad sense, we could think of "Electrome" as a term that refers to the study, mapping, or cataloguing of all electrical activity in the body or a cell.

We Are Electric

> ***"We Are Electric is about the natural electricity that surges through all our bodies.***
> ***Over the next few hundred pages I will teach you about the substance that courses through All Living Things, underpinning their every move and intention.***
> ***This Natural Electrical Current predates Nervous Systems and even humanity itself.***
> ***It is the most ancient thing about us. It is among the most ancient things about life itself.***
> ***We are fundamentally electrical creatures. How wholly and utterly your every movement, perception, and thought are controlled by electrical signals. This is not the electricity that comes from a battery. That kind of electricity is made of electrons, which are negatively charged particles flowing in a current.***
> ***The human body runs on a very different version: "Bioelectricity."***
> ***Instead of electrons, these currents are created by the movements of mostly positively charged Ions like potassium, sodium, and calcium.***
> ***This is how all signals travel within the brain and between it and every organ in the body via the nervous system, enabling perception, motion, and cognition.***
> ***Figuring out how electrical messages are sent through the body got a lot easier once we figured out the structure of the brain and spinal cord and the special cells that enable them to pass communications.***
> ***These are called nerve cells, or neurons.***
> ***All this was established in a series of groundbreaking insights known as the Neuron Doctrine, which won Camillo Golgi and Santiago ramón y Cajal a Nobel Prize in 1906.***
> ***It was the first time we understood how the nervous system worked.***

> *But the fight graduated to near war with the discovery of how the signal hops from one cell to the next. This is because that message hits a little speed bump at the end of the axon. There, it encounters a tiny gap that separates the axon of one cell from the dendrite of another. This gap is called a synapse, christened the same year the Neuron Doctrine won its progenitors the Nobel.*
>
> *The discovery of a gap between cells that were meant to be transmitting an electrical signal revived a lot of doubts about the still-fragile idea that animal electricity is real and that the nerve impulse is electric. After all, an electric signal can't travel over an air gap in telegraph wires, so why should it be able to do so in the wires of the nervous system?*
>
> *In 1921, the discovery of chemicals called neurotransmitters, which float across the synapse's gap, only deepened those doubts. Their experiments showed for the first time, in indisputable detail, exactly how the action potential is carried down a neuron by electrically charged particles, without whose electrical properties and activity nothing would happen at all. Those particles are called Ions.*
>
> *Ions are Atoms with a positive or negative charge. The fluid that bathes every one of your cells – there's a lot of it, and it's the reason you always hear that you are 75% water – is teeming with them. The Ions that are dissolved in this so-called "Extracellular Fluid" Bear a Strong resemblance to the constituents of Seawater: mostly Sodium and Potassium, with smaller amounts of other stuff including Calcium, Magnesium, and chloride. Their precise concentrations inside and outside each neuron are the primary determinants of whether an electrical signal is permitted to pass.*

Neurotoxins

> *In the 1960s, research on Neurotoxins had clarified that many of these natural poisons affect sodium and potassium balances, throwing into chaos the delicate mechanisms that make cellular communication possible–acting like a reverse Ringer's solution.*
>
> *Neurotoxins pry open all the doors, which has the same eventual effect: the cell can't communicate any signals to other nerves or muscles.*
>
> *No cell can survive without functional ion channels. One of the more astonishing features of the Electrome is that animal electricity is by no means confined to animals. We're not the only ones with these ion channels. All the other kingdoms are run on the same stuff." -* in *"We Are Electric: The New Science of Our Body's Electrome", 2023.*

This experience with **brain electrostimulation spurred his decade-long research into the Interrelationship Between Electricity and Biology, and all the possibilities this field of knowledge offers.**

> *"Following my physics degree education at Imperial College London, I fulfilled my childhood dream of studying the body's electricity, initially (and for 25 years) on the electrophysiology of retinal neurones but also on a variety of other model systems. The whole of my academic career has been spent at Imperial, rising to Professor of Neurobiology in 1995.* ***Curiosity took me to studying electrical signalling in cancer cells where I discovered the voltage-gated sodium channel as an engine of cancer."*** *- Dr M. Djamgoz, Emeritus Professor in Cancer Biology*

Dr M. Djamgoz, Emeritus Professor in Cancer Biology at Imperial College London, has developed a revolutionary **cancer treatment that involves blocking Ion channels in cancer cells.** Some studies suggest that **cancer cells may have altered ion channel activity profiles compared to normal cells, which may contribute to their malignant behaviour.** For example, **some types of Ion channels may be overexpressed in cancer cells, allowing them to maintain a faster rate of cell growth and division. Bioelectricity has great potential for cancer treatment, this is not its only use. It can also be used to heal wounds. Skin cells generate an electric field when injured, which attracts healing agents to the injury site to accelerate the healing process.**

Researchers have been exploring ways to harness and enhance this process, which could be especially useful in cases where healing is slow or complicated, such as in people with diabetes or chronic wounds. **Some strategies that have been investigated include the use of bioelectric bandages or devices that can deliver a Low-Level Electrical current to the wound.**

The idea is that: By Strengthening the Existing Electric Field or providing one if the natural field is insufficient, cell migration to the wound area can be promoted, thus accelerating the healing process.

Many doctors and biologists have limited knowledge of physics, and may find the idea of electricity as a cure intimidating. In the field of Bioelectricity, there is a fundamental law, a universal rule that is applicable and can be extrapolated to all human beings equally. Understanding the full scope of the Electrome will require much more than simply mastering Ion channels or understanding the nervous system. It will require a significant interdisciplinary effort and a critical examination of how the structure of current science may limit scientific understanding. It will also require rethinking the materials we use to interact with our electricity.

Biology, far from being a simple collection of living organisms, is increasingly revealing itself as a fascinating and **complex web of interconnected layers, one of which is electrical.** Almost 3 centuries ago, **the Study of Electricity** shifted from biology (Galvani) to physics (Volta). **The time has come for it to return to Biology."** - in "Muy Interesante", Spain, October 2023.

The Body's Electrical System

"The body's internal energetic control systems are subtle, and they operate with minute amounts of Electromagnetic Energy.
A little goes a long way, and very often, more is not better.

It is important to emphasise that:

The Body's Electrical System operates using currents that flow in only one direction, which is referred to as Direct Current (DC)." - Robert O. Becker, in "Cross Currents: The Promise of Electromedicine", 1990.

Life Is Electricity

"The Human Body is a Body Electric. As more recent medical research has discovered, the human body itself is an electrical system.

Chemical reactions taking place constantly throughout the body create electricity that moves from one part of the body to another.

And, like any other electrical system, the human body suffers when its currents go awry.

Life Is Electricity

Life is defined by Electrical Movements in the body. When electricity stops moving: that is death. Life and Electricity are very closely related. A once-startling medical technique that takes advantage of this connection; sending electricity directly into a patient's body, has become commonplace.

Electricity also plays a less obvious role in treating illness and saving lives.

Electricity can be a kind of medicine itself. Doctors send a flow of electricity directly into a patient's body to stimulate a muscle, to deaden pain, or even to tell a patient's heart how fast to beat. This is what doctors mean by medical electricity; electricity used as a treatment for illness or injury. You are familiar with electricity as some mysterious, powerful force that comes from outlets in the walls of your house and makes machines run.

Electricity is what happens when Ions come near one another, and Electrons move from negative Ions, to positive Ions.

The ability of electrons to move in a definite direction; to flow in a current; is a basic feature of electricity. Charge and current both help explain how the human body produces electricity and transmits it throughout the body.

Neurons and Electrochemistry

The basic building block in the human electrical system is a spidery cell known as a neuron. Neurons make up your brain, your spinal cord, and a network of nerves that carries electrical messages throughout your body. At the center of each neuron is a cell body, where most of the neuron's activity occurs. From there, several extensions called dendrites branch out. One longer tube-like structure, called the axon, also projects from the cell body. The dendrites can pick up signals from other neurons in the neighbourhood.

The Axon helps carry such signals toward still other neurons or toward Muscles and Glands. This signal-transmission process is Electrochemical: That is, Electricity and Chemicals both play a role.

The attraction between positive and negative ions, as well as the current they can create, is very important in the way neurons work. How could the muscles in your hands, arms, and legs get messages from your brain? Your body's electrical system made it possible. Because your Nerves were properly conducting Electrical Signals to your muscles, you were able to leave your chair in the living room. Electricity even allowed you to taste the drink, to know that it was cold, and to feel." - in "Electrifying Medicine: how Electricity sparked a medical revolution", 1995.

The Influence of the Nervous System

"That which is true of the Heart, is true of every organ of the body; **not one of them can originate the power necessary for its own activity. They all possess the ability to make manifest a power transmitted to them; but they cannot originate this power. The Nervous System alone, Possesses the Power of Originating Vital Activity. A Rational Method of Cure consists in the restoration of the Nervous System to a normal condition.** There are about 70 elements in nature; about 15 of these are found in the human body; hence, the human body, viewed from the chemical stand-point, is a combination of 15 elementary bodies.

1. If these elements are present in proper amounts, proportions, and combinations, the resultant product must be a perfectly healthy human being.

2. Whenever disease exists, it must be because some of these elements are in excess, or are deficient; or because there is some fault in their combination; such excess, deficiency, or faulty combination, being due to some cause working from within, or to the influence of some poison introduced from without.

If the Nervous System has ceased to generate vital force, all the organs and functions come to a stand-still. The Nervous System is the Vitalizing Department of the Human Body; that it Originates Vital Force and transmits it to the different organs and parts of the body; the Nervous System presides over,

regulates, and controls all our functions; a normal nervous system will produce normal function; an abnormal nervous system will produce abnormal function; no matter where located." - in "The Annals of Hygiene", January 1897.

The Science of Electro Therapeutics

"Absence of adequate knowledge of the electrical system given by Nature to man has rendered the practice of Electro Therapeutics little more than experimental. He holds the view that Nature's methods cannot be improved upon, and merely claims for himself that he has endeavoured to understand those methods, and understanding them; in some measure at least; to apply them to the amelioration and cure of a few of the ills which afflict humanity. In reality many of the disorders from which we suffer, many of the affections whose origin is obscure are simply and easily dealt with when their locality, area, and nature are ascertained.

The Nervous System in Its Relation to Neuro-Electricity; The Function of Nerves in the Human Body

The Nervous System is that which is most important to the subject-matter of this treatise, and therefore requires special consideration. It forms a most complicated set of links between the various parts of the body, and for the purpose of closer study may be said to consist of the following divisions:

1. Central Nervous System, which is formed by the brain with its extension in the spinal cord.

2. Distributing System, which includes the cranial and spinal nerves, and the nerves of the special sense organs.

3. Motor and Automatic Nerves.

4. The sympathetic system, which co-ordinates the action of the whole.

The Central Nervous System, the most important portion of which is the Brain, is in all vertebrated animals, including man, situated within the cranium or skull, which is the apex of the spinal column, of which it forms a part.

Electricity Is Life

A Necessary Preliminary to Curative Treatment is knowledge of the Human Electrical System; the generator or generators of Nerve-Force, the conductors and dielectrics, the condensers and their capacity, and what is of paramount importance: the influence of disease upon any or all of them.

It has often been said that: "Electricity Is Life."

Qualify the statement somewhat and say that Nerve Energy which resembles Electricity, is vitality, and I agree, because we always find that a high standard of Nerve-Force, or a high Neuro-Electrical potential, and mental and physical vigour are synonymous terms." - in "Electro-Pathology and Therapeutics: An account of many years Research Work", 1914.

The Electric System of the Body

Concerning the Electric System of the Body; Every Emunctologist, should know, should be aware that: The Nerves Are the Electrical System of the Body.

Nerve-Force

The Supply of Nerve: Is the Nerve-Force.

Nerve-Energy

The air, when entering the lung, force forms and produces new Cell Energy to the whole system, so that each unit of Energy has its incentive to carry to the various portions of the body the force, and power which it is to exercise and use to the proper rebuilding, and to the keeping of an equilibrium throughout the system. This is Nerve-Energy.

"We know, or at all events it can be demonstrated, that Man Is A Self-contained Neuro-Electrically controlled machine, dependent for the due performance of his functions upon a constant supply of Nerve-Energy at a low potential; that Nerve-Force is generated in the body with each inspiration, and that the nerve-impulse is non-electrical and not chemical.

If that is so, and it cannot successfully be disputed, it may reasonably be assumed that in all probability electricity plays a part in the vegetable as well as in the animal world. Investigation has shown the soundness of this theory, as I hope to be able to prove, and further research at the hands of men more capable than myself may lead to far-reaching consequences in the direction of an advancement of our knowledge of practical Horticulture and Floriculture.

Briefly, the conclusions at which I have arrived are as follows:

1. Everything living, whether animal or vegetable, has a well-defined Electrical System; the non-living possessing capacity only; and that only in conjunction with moisture.

2. Broadly speaking, the edible part of a fruit or vegetable is the positive element, or that part which yields a positive galvanometric reaction.

3. Dry earth is a bad conductor of electricity, and therefore water is required as an electrolyte as well as being necessary in the formation of protoplasm, etc.

4. Every tree, shrub, plant, fruit, vegetable, tuber, and seed is an Electrical Cell, differing from cells made by human agency in that it cannot be polarised or discharged so long as it remains structurally perfect.

5. The skin, peel, rind, or jacket of fruits and vegetables is of the nature of an insulating substance primarily designed for the conservation of their electrical energy.

6. The electro-motive force of them all is the same; the current varying in accordance with Ohm's law.

7. Plants grown in pots or removed from the earth and placed in other receptacles differ materially in their electrical constitution from those grown in the earth.

8. If a suitable electrolyte, other than water, is mixed with the soil it is possible to grow plants with much less moisture.

9. Growth may be stimulated by means of a continuous current of electricity of low potential and proper sign.

In normal conditions of weather and in countries free from frequent seismic and magnetic disturbances, the Earth is always the negative and the Air the positive terminal of Nature's Electrical System. Everything, therefore, that grows in the earth is charged by the earth through the roots, and by the air through the flowers and leaves (the lungs, as it were, of the tree or plant), so that in the roots, stem, stalks, and veins the tree, shrub, or plant has its negative terminals, while those parts of the leaves between the veins are positive.

Examination of the vascular bundles and laticiferous vessels of plants will make this clear. In all fruits and vegetables the negative and positive systems are plainly discernible." - in "Studies in Electro-Physiology", 1918.

A Note Concerning Nerve-Force

The supply of Nerve, that is the Nerve-Force in itself proper.

A uniform supply of Blood-Force, gives more uniform Nerve-Force.

An inaction of the Nerve-Force on the brain: lack of force results in the lack stimulation to the matter in the brain; thus disturbed equilibrium results.

Lesions along the spine; create a lack of Nerve-Force. An impediment upon the Nerve-Force; results in a lack of nutriment in the system.

The physical man, that is, the body in itself, that is the whole man that includes the physical self, mental self and the abnormal body, or the abnormal mind. In the physical body, the attributes, that is the muscular force of the body and the circulation, that is, the blood force in the body, rebuilding the body in itself, that is, the structure outside, the bone and the muscle of the body.

Both Toxaemia, and or Injury to the Body System, can produce conditions in the body that effect on to the mental, and mind of the body, thus producing abnormal conditions in the body system. Through the muscular force or through the blood supply. The Nerve-Force to the body, which is the attribute to the mental man, same as the circulation to the physical, the nerve of the body is to the mental, or to the brain force, which is the head, the moving power, of the physical man. An impression to the Nerve-Force carried by the muscular force of the body to the brain, makes an impression to be used as to how to move the forces in the physical man, to the betterment of his condition.

The Abnormal Mind, or that is, the working power between the brain force or the Nerve-Power in the body, is to the body that which takes care of the body, or that takes care of the involuntary forces in the physical and mental man.

That is the action between the nerve and the brain, or that active self that takes place. The same force that propels the circulation, that puts out the hand or takes it away when it is hurt; the same force that gives the feeling to the nerve of the physical man. These are 3 attributes, or 3 forces in the human body.

Through the Abnormal Mind, or sub-conscious condition of the body, takes control of the system, producing within it then the condition to the mental mind, to the physical body of the whole man.

Or, in other words, have it prepossessed from the outside.

This can produce taxing conditions. The physical man by this force on the nerve of the body supplying then more cells in the brain, or breaking up of these cells. An impression to the Nerve-Force carried to the brain, makes an impression, or destroys a cell, whereby the impression is left.

The action is the abnormal, not the abnormal condition, physical or mental, but the abnormal mind working in the man.

The effects we have on the Nerve-Force (that is, through the electrical; life is electrical force), the same action we have in the body of the Nerve-Force is to the Mental World, Electrical.

The Scientific Research, the Clinical Research which Is principally of the Emunctology School, the Teachings of the Atomic and Vibratory Force, using only those of a Very Low Ray of Light in diagnostic ends. This may easily be seen to be made to include Treatments from the Health Lights in Rooms, so that the diagnostic end may be made a portion. These are indeed revolutionizing the effects as may be brought to bear on the human element, and its relation to the Atomic Forces, which are Necessarily of Light and its vibrations.

> ***"That which is regarded as a superstition in one century, may form the basis of science for the following one."*** *- Theophrastus Paracelsus*

"All Living Cells Are Composed of 2 Essential Elements; the nucleus and the protoplasm in which it is bathed.
This nucleus is itself composed of many tubular filaments: the chromosomes.
In addition, hundreds of such small filaments or chondromes are present in the cytoplasm.
Chromosomes and Chondromes are present in the cytoplasm.
Chromosomes and Chondromes are Sheathed in an Insulating Substance, and contain a Liquid like Serum, with the Same Mineral Content as Sea Water, and Consequently a Conductor of Electricity.
Thus, these filaments constitute ultramicroscopic oscillating circuits of very short wave lengths.

I have demonstrated in my works that these cellular oscillating circuits, chromosomes and chondromes, vibrate electrically under the stimulus of electromagnetic waves:

1. Cosmic
2. Atmospheric
3. Telluric

Many internal, and external influences may upset the oscillating equilibrium of these cells." *- Georges Lakhovsky, in "The Secret to Life", 1941.*

Knowledge of The Electrical System Given by Nature to Man

"The object of this treatise is to present to the medical profession and the general public the results of 30 years research work with instruments of precision. The microscopical part of the work having been carried out by Dr Bowman, MD, and the Electrical by Mr Baines.

The object of the physiological investigation which forms the first part of the book was to endeavour to determine the nature of the influences which favour the growth and multiplication of inimical organisms, such as bacteria in the blood, and which are a cause and consequence of disease.

Absence of adequate knowledge of the Electrical System given by Nature to man has rendered the practice of Electro-Therapeutics little more than experimental.

He holds the view that Nature's methods cannot be improved upon, and merely claims for himself that he has endeavoured to understand those methods, and understanding them (in some measure at least), to apply them to the amelioration and cure of a few of the ills which afflict humanity.

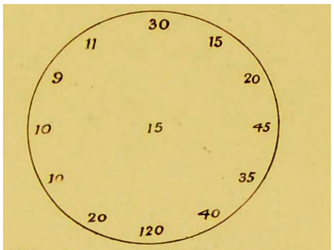
There are several instruments to the medical man.

They will not distinguish between Chronic Constipation, or Dyspepsia, and Cancer in its early stage: they do not throw any light upon disorders of the brain or diseases of the middle ear, upon St. Vitus Dance, or Neurasthenia, or exophthalmic Goitre, or give the slightest indication of the nature of the great majority of ailments until they become outwardly apparent.

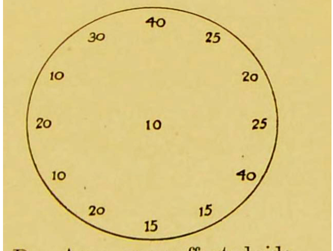
What is required is an instrument which will enable the practitioner to say, "This is so-and-so" with absolute certainty.

In the future the new method of diagnosis will become universal, and in the hands of a large number of scientific men will do a great deal to revolutionise the practice of medicine as it is today.

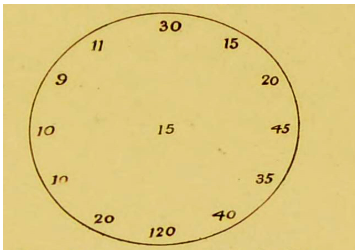
Cancer



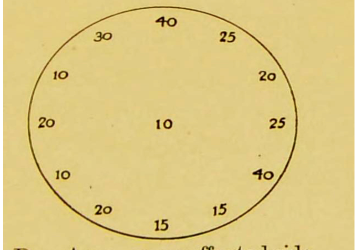
C = Area, on unaffected side, of B.



D = Area, on unaffected side, of A.



C = Area, on unaffected side, of B.



D = Area, on unaffected side, of A.

A = Area of the secondary deposits.
B = Cancerous growth.
C = Area on the unaffected side corresponding to the Cancerous growth.
D = Area on the unaffected side corresponding to the secondary deposits.

A gave the following deflections, taking the numbers 1 to 12, as the hours on a dial. With the exception of the 120 millimetres at what we may call 6 o'clock on C, most of the deflections from C and D are consistent with the hand-to-hand deflections of the patient.

The Cancerous growth itself, however, is apparently dielectric in character, interposing a very high resistance to the passage of Neuro-Electricity through it, or being in all probability an absolute non-conductor.

In A the hours 10, 11, and 12 are suggestive of a Cancerous Condition, while the higher deflections at 4 and 7 may be due to the presence at those points of Septic Matter.

But however that may be, this suggestion occurs to my mind: If we can establish beyond any reasonable doubt that:

An Absence of Conductivity Is A Condition Peculiar to Cancer;

We have at least discovered an infallible means of detecting its presence; in time for Curative Measures to be effectually adopted.

FIG. 17.—Cancer in Neck and Breast.

Cancer in Neck and Breast

Here we have a similar, if not precisely similar, Electrical Condition, with the exception of Septic Matter (if the high deflections are caused by inflammatory Septic Matter), invading A at points 5, 6 and 7 (analogous to B at points 3 and 7), while the other deflections on the unaffected side are what might be looked for from the hand-to-hand deflection.

Another interesting feature is the line of cancer from D through B to E, or vice versa.

The Liquid Cells Are Always Ionised

The liquid contents of the nerve substance are greater than that of the covering membrane, and the liquid cells are always ionised.

Why We Have Been Left So Long In Ignorance

If anything I have said appears to be in any way boastful let me say at once that I regard the discoveries I have been permitted to make from a purely impersonal standpoint, and without any consciousness of self-appreciation. I can, in fact, only wonder that it has remained for so obscure a person as myself to direct attention to such obvious truths; while if there appears to be anything marvellous in the curative measures I have adopted, a little reflection will show that they are simple measures which must have suggested themselves to any electrician conversant with the class of work to which I have been accustomed.

There is, however, one reason for wonder, for astonishment so deep as to close the door, as it were, to possible explanation, and that is:

"Why and how it is we have been left so long in ignorance."

." - in "The Nervous System in Its Relation to Neuro-Electricity; The Function of Nerves in the Human Body, Electro-pathology and Therapeutics, 1914.

Energy Flow is the Primary Factor

"Energy flow is the primary factor.

Energy is the real substance behind the appearance of matter and forms.

It is best for man to work with Nature and to be in tune with Nature and with God instead of giving in to his own desires to control anything besides himself.

The whole constitution of man must be taken into consideration, not merely the treating of the body as a chemical or mechanical machine.

In this age of over specialization, with emphasis on chemistry, bacteriology, and mechanical and surgical research, we have lost sight of the over-all picture of man as a living being with lines of force working in fields of finer energies.

Even as the tiny atom is a universe in itself, so is man.

God geometrizes.

Faith coupled with effort always gets results.

Causes are primary factors to correct.

If external cleanliness is said to be next to Godliness, what could real internal cleanliness accomplish?

We are what we eat and drink.

What we feel and what we think.

We will become that which we contemplate.

We cannot think negative thoughts and reap positive results.

Health is not merely of the body, it is one in all. Health is movement. Disease is fixation.

Never force anything, physically or mentally. Nature's way is gentle growth."

- Dr Randolph Stone, DO, DC, in "Writings", 1981.

The Flow of Life-Forces

"Psychic Healing ability was many times demonstrated by Saint Thérèse of Lisieux, known for her "little way" of spiritual life, which emphasized small acts of love and trust in God's mercy to achieve holiness.

This takes the form of laying on of the hands to cure broken and protruding bones, in extreme cases.

Almost every type of human affliction in which enhancement of the flow of life-forces of the victim would bring about the cure, Therese could enhance, or amplify this vital cosmic energy flew through the bio-system by stimulation from her mental-system.

Therese's administrations succeeded in many, many instances.

Over the world today, there are a sufficient number of successful psychic healers, some even performing lawfully in British Medical hospitals, to enable science to accept the fact that the bio-energy flew through the living human body regulates health and even the healing thereof.

Science as yet is not able to either agree that there is such a bio-energy flow, or indeed to give it a name.

It has shown that it is a "cousin" of what we call Electricity, but here-in will be outlined a number of reasons why that is not the whole story.

Cellular Mitogenetic Radiation is another definition.

Mitogenetic Radiation refers to the Ultraviolet Radiation, discovered by Alexander Gurwitsch in 1923, that is emitted by dividing cells and stimulates other cells to divide." - in "Overlords and Olympians", 1996.

Prioré Cancer Treatment

"For 2 years I had been consumed with curiosity about the affair, named after its principal character, Antoine Prioré, an Italian-born inventor noted by his enemies for his lack of formal education and by his friends for his intuitive genius.

Prioré, I knew, had been tinkering with odd, complex electromagnetic contraptions of his own design for 26 years since his days as a radar technician in the Italian Navy.

What education he received was from an Electronics School in Bologna.

Prioré would later tell me that **he had serendipitously discovered that certain Ultra high-Frequency Electromagnetic Waves, presumably somewhat akin to those utilised in the radar devices with which he was so familiar, had the power of preserving fruit; an orange that had inadvertently been exposed to the radiation, he noticed, remained unspoiled much longer than it should have.**

Assuming that the radiation must somehow have been responsible, he decided to experiment, soon verifying, that the shelf life of various fruits, and vegetables could be significantly extended by exposing them to certain Electromagnetic Waves.

It filled a good-size room, its panels of knobs, dials, lights and energy units banked against the 4 walls so that there remained only a small space in the center of the room for a table, over which was suspended a huge nozzle, through which emanated the output of the machine, the ray itself. Just what the invisible ray consisted of, Prioré steadfastly refused to say, other than to characterize it as "an electromagnetic wave in a magnetic field."

Many French scientists have been more interested in trying to establish a positive correlation between the amount of government funding accorded Antoine Prioré and the various levels of political power to which Chaban-Delmas has attained than in verifying the in **correlation between Priore's mystery radiation and cancer cures in laboratory animals.**

It was through the Chief Veterinary officer of the city of Bordeaux that Prioréwas persuaded, in 1960, to **permit two members of the University of Bordeaux Faculty of Medicine to expose rats grafted with cancerous tumors to the radiation of the machine.**

To the amazement of Professor J. Biraben, and Dr G. Delmon - all tumour growth was halted.

Prioré Machine, he continued, at last provided an opportunity for scientific evaluation of the biological effects of "radiation in an electromagnetic field."

The field was defined only as having an intensity in the neighbourhood of 620 gauss-about 1240 times the power of the natural earth field.

The frequency of these waves was said to be approaching that of gamma radiation. Some 48 rats of the same heritage, age and health had been selected for the experiment that Professor Courrier related. All had fragments of the same uterine T8 cancer tumour grafted beneath the skins of their backs.

The Results

Among those experimentals which were given immediate treatment, the tumours were quickly and totally absorbed.

Where treatment was delayed, exposure had to be prolonged in order to obliterate the cancer. But obliterated it was-until all of these animals, as well, were in perfect health, with no trace of cancer. The experimentals were observed for several months and there was no recurrence of the disease.

All of the controls, meanwhile, died between the 22 and 30 days after grafting.

Prioré may soon have an earned doctorate attached to his name.

The inventor has completed all the doctoral requirements of the University of Bordeaux, including his dissertation:

"Healing of Acute and Chronic Experimental Trypanosomiasis by the Combined Action of Magnetic and Electromagnetic Modules."

Next, the researchers wanted to know whether the radiation could vanquish trypanosomiasis, after it had become entrenched. Rabbits were used in these experiments because the disease produces in them a chronic malaise in which they decline toward death far more slowly than mice.

Infected rabbits that were still living at the end of 3 weeks were exposed to the radiation; improvement began to manifest itself almost immediately, but the treatments, when initiated at this advanced stage in the evolution of the disease, had to continue for 12 hours each day for about 20 consecutive days on average before healing was complete.

In the course of one of the rabbit studies, Prioré gained another powerful supporter in the person of Gaston Mayer, a well-respected reproductive scientist.

In collaboration with Professor Pautrizel, Professor Mayer **found that the normally irreversible testicular degeneration caused by trypanosomiasis could be overcome with the radiation.**

At the conclusion of this exercise, the results were much as before of the 30 mice inoculated with the parasite and then treated with the machine, 29 lived.

A 1972 paper, entitled "Action of Electromagnetic Waves and of Magnetic Fields on Lipid Modification Provoked in the Rabbit by Administration of a High-Cholesterol Dietary Regime."

It was authored by Professor Pautrizel, Prioré, Modeste Dallochio, Rene Crockett, and presented to the Academy by Professor Courrier.

Sure enough, **the results indicated that the radiation might make a significant contribution in the fight against Heart, and Vessel Disease.**

The Delegation Generale a la Recherche Scientifique et Technique (DGRST), one of the top French government scientific agencies.

The director of DGRST, Pierre Aigrain, a physicist who received some of his training in the United States and who, recently, was conducting research at M.I.T.

Dr Aigrain, who has held various high government posts, and is noted for his work in the complex physics of semiconductors, was at a loss to explain the underlying principles of the Prioré apparatus, despite the fact that he has personally examined the machine.

"None of the possibilities of resonance appear to answer to the known laws of physics", he was quoted as saying at the conclusion of that examination.

It is now beyond theory however, that electrically charged atoms, and molecules called Ions, exist in the cells, and quite naturally interact with Magnetic Fields, whether natural or man-made.

In this connection, the work of Dr Andrew Bassett and his associates at Columbia University's College of Physicians and Surgeons is instructive.

They recently reported that broken bones exposed to certain electromagnetic fields heal substantially faster than fractures that do not have benefit of this stimulative treatment. In one of Dr Bassett's studies: "fracture disability time" was reduced by 50%.

The healing probably takes place as a result of voltage-induced changes at the site of the cell membrane. Dr Bassett believes, New Scientist notes: "that electromagnetic stimulation has the effect of changing the membranes ability to hind such Ions, as Calcium, Magnesium, and Sodium."A number of other recent findings suggest that electromagnetism may have a profound impact on enzymes, the essential catalysts of metabolism.

In one study, for example, magnetically deprived mice (those placed in extremely low magnetic fields), suffered shortened life-spans, unfavourable tissue alterations, infertility and “drastic changes in enzyme activity”, that were said to be “potentially lethal.”

A recently developed Navy study demonstrated that low-frequency fields could, at a level of statistical significance, increase the blood triglyceride levels of man (Triglycerides are lipids which, have been implicated in atherosclerosis).

The Navy research suggested that low-frequency fields effect a decrease in the activity of an enzyme that helps suppress blood triglyceride levels.

It is not illogical to assume that certain high-frequency fields might affect the magnetically vulnerable lipids and enzymes in another, perhaps opposite, direction the Prioré apparatus he looked at, the machine featured, among other things, a vacuum tube containing a plasma of mercury and neon gas.

This Plasma was apparently subjected to the simultaneous action of a pulsed 9.4 gigahertz electromagnetic wave (one oscillating at 9.4 billion cycles per second, a very short radio wave, indeed) modulated on a high-frequency wave of 17 megahertz (17,000,000 cycles per second).

These waves, Dr Aigrain said, were produced by radio emitters and magnetrons in the presence of a 1000-gauss magnetic field.

The experimental animals were maintained during their treatments in this magnetic field through which the radiation had to pass, perhaps becoming mixed or altered in some fashion in the process.” - in **“Do the French Have a Cure for Cancer?”**, Esquire, 1 July 1975.

We Need a Plasma-Based Physics Rather than an Atom-Based Physics

The universe is alive and well! Space is not empty and forlorn; on the contrary, we live in the boundless embrace of a sentient field of cosmic plasma and have only just begun to realize its presence.

In 2022, Professor Robert Temple, issued a most important Monograph on that which makes up 99.999% of the Cosmos: Plasma.

Plasma not only governs the vast expanse of myriad galaxies and stars but, according to Temple, is also the essential substance of living organisms, a “bioplasma” that not only explains the fantastic organization and workings of our bodies, but overlaps with our Biofield (the energy body), that connects phenomena like consciousness and telepathy with what happens at the moments of conception and death.

Plasma Is 99.99% of Everything That Is

The visible (baryonic) matter in the universe, is composed of Plasma.

While solids, liquids, and gases are common on Earth, they are rare in the cosmos:

1. Abundant State: More than 99% of the visible universe (stars, nebulae, and interstellar/intergalactic matter) is in a state of plasma.

2. Definition: Plasma is an ionized gas, meaning it is a mixture of free electrons and positive ions created by high temperatures or strong electromagnetic fields.

3. Visible vs. Total: It is important to note that this 99.9% figure applies only to "visible" or baryonic matter. When factoring in dark matter and dark energy, which make up roughly 95% of the total universe, the total composition is more complex.

4. Solar System: Our Sun, which is a giant sphere of plasma, contains about 99.85% of the total mass of the solar system.

We Need a Universal Science Not an Earth Science

“Plasma is not made of Atoms; because it's made of Particles: Charged Particles. What is charged? Well, now here's something that very few scientists will admit; because it's so embarrassing; that basically would like to hide in a corner. The fact is that; we don't know what charge is.

And we don't know what mass is. We don't know what force is. We don't know what a field is. We use these words, and we have these concepts which are undefined. So, the only way we can ever get answers to those questions, and define the things which remain undefined; is to create a much more extensive Plasma Based Physics; rather than an Atom Based Physics.

We need a Universal Science not an Earth Science.” - Professor Robert Temple, in “We Need a Plasma-Based Physics Rather than an Atom-Based Physics We Need a Universal Science Not an Earth Science”, The Solari Report, 13 May 2026.

> ***“I am suggesting that we are all made of Plasma, and that our Physical Bodies are temporary vehicles for us to operate in the Physical World, for the short periods of time that our fragile bodies can permit.”*** *- Professor Robert Temple, in* ***“A New Science of Heaven How the New Science of Plasma Physics is Shedding Light on Spiritual Experience”****, 2022.*

99.9% of All Life-Forms Consist of Plasma

"First of all, it is matter. But it's it's not matter made of atoms. It has been conventional to say that there are 3 states of matter.

There's solid, liquid, and gaseous; that applies to atomic matter.

Physical matter is essentially atomic matter because of may being made of atoms, but we tend to say physical matter in conversation.

However much we may study physical matter, it doesn't mean anything in terms of understanding the universe.

Indeed, it leads you down a false path, because you come to assume, well, if that's what things are like here; that's what things are like everywhere.

Which is weak reasoning.

The all this Plasma is everywhere, and it's got these strong Electromagnetic forces, which are 10 followed by 35 zeros stronger than the so-called force of gravity. So, this is the background.

And and once you know this; how Universal Plasma Is; then you're not surprised when we start talking about Life Forms being Plasma Life Forms.

Because if 99.9% of the Universe Consists of Plasma, it follows by elementary reasoning that: 99.9% of Life Forms in the Universe are probably also Plasma Life Forms.

And this brings us back to us; are we really atomic life forms, or is that itself an illusion?

99% of the Universe is composed of Plasma rather than Atomic Matter.

In fact there are two gigantic clouds of plasma, called the Kordylewski Clouds, hovering between the Earth and the Moon.

Clouds of plasma are superheated states of matter where electrons are ripped from their atomic nuclei, creating a highly conductive, glowing fluid.

In space, these Electromagnetic "clouds" drive the Universe's most dramatic phenomena; from the Sun's coronal eruptions to the aurora borealis dancing over Earth's poles." - Professor Robert Temple, in "Future Science Series: A Conversation about Plasma", Solari Report, 5 May 2026.

The Fourth Phase of Water

"The existence of a Fourth Phase of Water; is not entirely unexpected.

The physical chemist Sir William Hardy argued for its existence; and many authors have found evidence for some kind of "ordered" or "structured" phase of water. Experimental evidence not only confirms the existence of that ordered, liquid-crystalline phase, but also details its properties. These properties explain why gelatin desserts hold their water. The energy for building this structure comes from the sun. Radiant energy converts bulk water into ordered water, building this zone. We found that all wavelengths, from Ultra Violet through visible, to Infrared can build this Ordered Zone. Near Infrared energy is the most capable. Water absorbs the infrared energy freely from the environment; it uses that energy to convert bulk water into liquid crystalline water. Hence, buildup of the fourth phase occurs naturally and spontaneously. Energy input beyond that occurring naturally creates additional liquid crystalline buildup. Of particular significance is the fourth phase's charge, commonly negative. Absorbed radiant energy splits water molecules; the negative moiety forms the building block of the ordered zone, while the positive moiety binds with bulk water molecules to form free hydronium ions. Adding more light stimulates more charge separation. This process resembles the first step of photosynthesis. In that process, energy from the sun splits a water molecule. Splitting is catalyzed by a hydrophilic chromophore. The process under consideration appears more generic: any hydrophilic surface may catalyze the splitting, some more effectively than others. The charges separated by light resemble a battery. That battery can deliver energy in a similar way as the separated charges in plants deliver energy. Plants, of course, comprise mostly water and it is therefore no surprise that similar energy conversion takes place in water itself. The stored electrical energy in water can drive various kinds of work, including flow. An example is the axial flow through tubes. We found that immersing tubes made of hydrophilic materials into water produces flow through those tubes, similar to blood flow through blood vessels. The energy derives from the radiant energy absorbed and stored in the water. Nothing more. Flow may persist undiminished for hours, sometimes longer. Additional incident light brings faster flow. This is not a perpetual motion machine: incident radiant energy drives the flow; in much the same way that it drives vascular flow in plants. This energy conversion framework is rich with implication for any system involving water, ranging from Biology and Chemistry all the way to Atmospheric Science, Engineering, and Health Sciences. The fourth phase can appear nearly everywhere. All that's needed is water, radiant energy, and a hydrophilic surface. The latter can be as large as a slab of polymer or tissue and as small as a dissolved molecule. The liquid crystalline phase inevitably builds — and its presence plays some integral role in the respective system's behaviour." - Dr G.H. Pollack, PhD in "The Fourth Phase of Water: A role in fascia?, Journal of Bodywork and Movement Therapies, October 2013.

Electrically Expanded Water: The Plasma Form of Water

"Electrically Expanded Water (EXW) is a negatively charged plasma with an added electron. It is water that has soaked up electricity which is bio-available.

A third gas is formed from an electrolyzer, which is the definitive difference between hydrogen as H_2 and Hydroxy or "Brown's Gas." Hydrogen electrolysers often have a membrane to separate out the ozone, chlorides and the Electrically Expanded Water. "Brown's Gas" generators so not, but have post-filtration to scrub out all but the Hydrogen, Electrically Expanded Water and the Oxygen. At the Water Conference 2019, Dr Gerald Pollack; asked George Wiseman: **Whether Electrically Expanded Water was the same as Exclusion Zone Water (EZ Water) with an added electron.** George Wiseman response to this specific point about Electrically Expanded Water (EXW), and Exclusion Zone Water (EZ Water):

1. Exclusion Zone isn't water (it's H_3O_2) a gel-like substance that excludes impurities. We should start calling it Exclusion Zone Gel. That's what Dr Gerald Pollack called it when speaking with me when I confirmed all the conclusions below with him.

2. Exclusion Zone gel isn't water. Water is H_2O. This substance is H_3O_2, and just because it's Made of oxygen and hydrogen does not make it water (H_2O). No one would mistake or call Hydrogen Peroxide (H_2O_2) for "water" (H_2O), so calling Exclusion Zone Gel (H_3O_2) "water" is incorrect.

3. Exclusion Zone Gel isn't the "fourth phase of water" (That was just a catchy title to a book). **The Actual Fourth Phase of Water is Plasma, Not Gel.** The gel could be called phase 1.5, (partway between solid and liquid).

4. Matter (water or H_2O) has 4 "major" states: Solid (ice), Liquid (water), Gas (steam or water vapour), and Plasma (Electrically Expanded Water or H_2O with added electrons. Exclusion Zone Gel (phase 1.5) is not anything like Electrically Expanded Water (phase 4).

5. Each "phase" of matter is achieved by adding energy. As you add heat, ice melts into water, then turns into steam and (adding electrons) then turns into Electrically Expanded Water. Nowwhere in that phase progression does the water H_2O turn into EZ gel (H_3O_2).

So the Statement "Exclusion Zone Water plus the added electron" is wrong on 2 counts:

1st EZ gel (H_3O_2 gel) is not "water" (H_2O).

2nd EZ gel is Nothing Like Electrically Expanded Water (negatively charged water plasma).

Wrong consistency (Gel versus Gas) and chemical formulation (H3O2) vs H2O).

6. What Electrically Expanded Water Does Do is provide the components (nutrition and energy) the body needs to Make Exclusion Zone Gel (H3O2). The body Uses Electrically Expanded Water to make Exclusion Zone Gel, But Electrically Expanded Water is Not Exclusion Zone Gel.

7. Exclusion Zone Gel is Needed in the body. It's how most of the Hydrogen, and Oxygen in the body is "structured" or "arranged"; Life just isn't possible without it. But saying that Electrically Expanded Water is EZ Gel is incorrect in almost every possible way." - in "Electrically Expanded Water - The Plasma Form of Water", Osmio, Water Conference, Bad Soden, Germany, 27 October 2019.

> ***"You're probably familiar with 3 States of Matter: Solids, Liquids and Gases, like; ice, water, and steam. Beyond Gases, there's another state of matter called Plasma. And it makes up 99.9% of the observable universe. This is completely different from plasma in our blood. We're talking about a state of matter, that's similar to a gas but with different properties. We actually don't see this kind of plasma very often on Earth, but when we do, it can be in beautiful and exciting ways. So it turns out that almost everything in our universe above an atmosphere altitude of about 100 kilometers, is a plasma. Some people estimate that 99.9% of everything in the universe is a plasma. The most significant source of plasma in our solar system is the sun. The sun is very hot, and it's a plasma. So we now know that plasmas can be found in Earth's atmosphere, the sun, and the lightning strikes of other planets. But where is this 99.9% figure coming from? You have to remember that space is really big, and so much of our universe isn't made up of planets or stars but is the really really vast spaces in between those objects. Most of interstellar space – the distances between solar systems – is full of hydrogen and helium plasmas. These interstellar plasmas are the result of exploded giant stars, millions of years ago. Overall, plasmas make up more matter than all of the solids, liquids, and gases in our universe combined. It's fascinating to look into the night sky and remember that the stars and the spaces between them are mostly made of this wild and energetic substance. On Earth, we're surrounded by solids, liquids, and gasses. And on a much larger scale, we're actually surrounded by plasmas. Our journey through this fascinating 4th state of matter started at some of the smallest particles, and ends with the vastest distances in our universe. And there's still so much to learn?"*** *- in "Plasma, Plasma, Everywhere!", NASA's Curious Universe, 9 August 2021.*

Chapter 4

The Importance of Electro-Therapy

Electro-Therapy if this is thoroughly understood, we may do away with most other types of Treatment; besides: Hydropathy, Osteopathy, Chiropractic, Neuropathy.

Hydropathy, Osteopathy, Chiropractic, Neuropathy and Electro-Therapy; are those Therapeutics that Cover the Broader Field of Service to Men.

The Emunctologist, should thus know the usefulness, and the indications for Electro-Therapy.

The study of Chemistry combined with Electro-Therapy (the study of Vibration of Chemicals administered in same to the body through Specific Instruments), and as well the use of Hand Electricity.

But in order to not be confusing to self, there should be those who thoroughly study to understand Electro-Therapy, as to its place in clinical practice.

Thus, the Hospitallers Order of the Good News, makes available a Postgraduate Course in the Field of Electro-Therapy, for those Emunctologists, that aim to specialize in the Field of Electro-Therapy.

> ***"Theories may change, fads may come and go, but, the True, the Definite Indications of a Remedy Never Change. They Are the Same Yesterday, Today, and Forever."*** *- in "Clinical Medicine", 1919.*

Electricity as a Biological Function

"The Phenomena of Life, can and should be explained solely by the working of the physical forces, which control the material universe; and that among these Forces; Electricity plays a Predominant Part." - Ernest Solvay, in "The part played by Electricity in the Phenomena of Animal Life", 1896.

Of the Living Motor of the
Nature of the Living Motor

"Among the essential characteristics presented by the animal kingdom, one of the most striking is unquestionably the faculty of automatic locomotion, which has been called motivity.

The study of this distinctive quality leads us quite naturally to the most general consideration of the phenomena of life in their connected aggregate, so that we may conveniently take this as our starting point when we propose to unfold the part taken by the forces of inanimate nature in connection with the phenomena in question.

Since motivity is essentially inherent in the nature of the living animal organism, we may say that an Animal is a Motor; further than this, we have good reason to believe that an animal is an Electric Motor.

We see at the outset that motivity can not arise from a dynamic transformation of potential energy of the kind presented to us in a hydraulic motor.

Electricity lends itself to a satisfactory solution of the problem before us, a solution to which it will be well that we give our attention.

The glands, which represent apparatus composed of cells of great vital activity, also undergo rapid oxidation.

Internal oxidation is for us the source of electricity.

This process goes on chiefly in the muscles and in the glands; hence we give to these portions of the whole organic structure the name of electrogenic apparatus.

It is interesting to notice that the tissues which are the seat of most active oxidation, as the muscles and the glands, are richly provided with nerves, while those in which oxidation is feeble, as the cartilages and connective tissue are but poorly supplied by the nervous system.

Thus the readily oxidizable tissues, forming the electrogenic apparatus, would play the part of the negative plate, the fluids producing oxidation and hydration that of the positive plate; the nerves would serve to close the circuit.

We should thus recognize in the economy of the living animal the chemical duality necessary for the production of electrical energy; should we not, consequently, be justified in considering this organism as a true physiological battery?

If so, we ought to follow up the comparison, and try to understand how this battery works; what is the nature and what the extent of its circuit; what are the causes which make its discharge to vary, and finally, what becomes of the energy which it develops.

In what way does the propagation of Electricity in the Nerves take place?

To answer it there will be need for seeking first of all to complete our knowledge of the constitution itself of the nerve fiber, afterwards to study very closely the electro-physical properties of nerve tissue, to investigate under what influences its electrical resistance varies, to determine finally the nature of the process itself by which the nerve current is propagated toward the organs where it is utilized.

Manifestations of nerve action are always accompanied by variations of electrical condition.

Muscle and nerve respond to stimulation of mechanical, thermic, chemical, or electrical origin, but the last of these is attended with especially remarkable results.

Electrical influence is in fact by far the most powerful and extended in its effect, whether it be applied directly to the muscular tissue or, above all, if it be applied to a nerve.

These facts have a double bearing: they seem to justify the idea of attributing to the nerves the part of conductors, and show also that electricity is the form of energy which lends itself better than any other to propagation to a distance and to distribution in the living organism.

Assuming that the nervous system is not the producer of energy, but that its function is only to distribute it, must we not hence conclude that by means of its stimulating power it can modify, hasten or retard this distribution?" - Ernest Solvay, Belgian Senator, Chemist and Industrialist (in 1861 he along with his brother Alfred Solvay, developed the ammonia-soda process (Solvay process) for the manufacturing of soda ash (anhydrous sodium carbonate) from brine (as a source of sodium chloride) and limestone - as a source of calcium carbonate), in "Electricity in the Phenomena of Animal Life", Texas Medical Journal, March 1899.

Important Note Concerning Electrical Forces

> ***The Emunctologist should always bear in mind, the following guiding principle of life, in any physical body: For while Electrical Forces, are life in its activity, in man (save where they are to destroy the plasms that work upon the body itself), they are more helpful in the low form, than the high form.***

"This peculiarity which, together with other mostly unlooked-for properties of these currents I had the honour to bring to the attention of scientific men first in an article in a technical journal in February 1891, and in subsequent contributions to scientific societies, **made it at once evident, that these currents would lend themselves particularly to Electro-Therapeutic uses.**

With regard to the electrical actions in general, and by analogy, it was reasonable to infer that the Physiological Effects, however complex, might be resolved in 3 classes:

1. The statical, that is, such as are chiefly dependent on the magnitude of electrical potential.

2. The dynamical, that is, those principally dependent on the quality of electrical movement or current's strength through the body.

3. Effects of a distinct nature due to electrical waves or oscillations, that is, impulses in which the electrical energy is alternately passing in more or less rapid succession through the static and dynamic forms.

This mode of applying currents in Health Treatment appears to me to offer the greatest possibilities at the hands of the physician.

While investigation is being turned in what appears to be the right direction, **scientific men are still at sea.**

This state of things impedes the progress of the physicist in these new regions and makes the already hard task of the physician still more difficult and uncertain. The facts mentioned would make it reasonable to expect that this extraordinary effect which, I have already usefully applied, will likewise prove to be of value in Electro-Therapy.

The continuous improvement of the instruments and the study of the phenomenon may shortly lead to the establishment of a novel mode of Hygienic Treatment which would permit an instantaneous cleaning of the skin of a person, simply by connecting the same to, or possibly, by merely placing the person in the vicinity of a source of intense electrical oscillations, this having the effect of throwing off, in a twinkle of the eye, dust or particles of any extraneous matter adhering to the body.

When this is done, **nothing will stand in the way of an extensive and efficient application of this beautiful discovery which must ultimately prove itself of the highest value, not only at the hands of the surgeon, but also of the Electro-Therapist and, what is most important, of the Bacteriologist."** - Nikola Tesla, in "8th annual meeting of The American Electro-Therapeutic Association", Buffalo, New York, 13 to 15 September 1898, The Electrical Engineer, 17 November 1898.

Nikola Tesla Writes About His Experiments in Electrical Healing

Some weeks ago this journal published an interesting article concerning Electrical Oscillations as observed by the eminent scientist, Nikola Tesla.

So much interest was shown in the subject that Mr Tesla was appealed to directly and in response he sent this letter:

"The many pressing demands which have been made upon me in consequence of exaggerated statements of the journals have painfully impressed me with the fact that **there are a great many sufferers, and furthermore that nothing finds a more powerful echo than a promise held out to improve the condition of the unfortunate ones. A great many communications have been addressed to me by physicians. To these chiefly this brief statement of the actual facts is addressed.**

Some journals have confounded the physiological effects of Electrical Oscillations with those of mechanical vibrations, this being probably due to the circumstance that a few years ago I brought to the attention of the scientific men some novel methods and apparatus for the production of Electrical Oscillations which I learn, are now largely used in some modification or other, **in Electro-Therapeutic Treatment. To dispel this erroneous idea,** I wish to state that: **the effects of purely mechanical vibrations which I have more recently observed, have nothing to do with the former.**

Mechanical Vibrations have often been employed locally with pronounced results in the Treatment of Diseases, but it seems that the effects I refer to have either not been noted at all, or if so, only to a small degree, evidently because of the insufficiency of the means which have eventually been employed in the investigations. While experimenting with a novel contrivance, constituting in its simplest form a vibrating mechanical system, in which from the nature of the construction the applied force is always in resonance with the natural period, I frequently exposed my body to continued Mechanical Vibrations.

As the elastic force can be made as large as desired, and the applied force used be very small, great weights, half a dozen persons, for instance, may be vibrated with great rapidity by a comparatively small apparatus.

I observed that such intense mechanical vibrations produce remarkable physiological effects.

They affect powerfully the condition of the stomach, undoubtedly promoting the process of digestion and relieving the feeling of distress, often experienced in consequence of the imperfect function of the organs concerned in the process.

They have a strong influence upon the liver, causing it to discharge freely, similarly to an application of a catharic.

They also seem to affect the Glandular System, notably in the limbs; also the kidneys, and bladder, and more or less influence the whole body.

When applied for a longer period they produce a feeling of immense fatigue, so that a profound sleep is induced.

The excessive tiring of the body is generally accompanied by nervous relaxation, but there seems to be besides a specific action on the nerves.

These observations, though incomplete, are nevertheless positive and unmistakable, and in view of this and of the importance of further investigation of the subject by competent men I prepared about a year ago a machine with suitable adjustments for varying the frequency and amplitude of the vibrations, intending to give it for investigation.

This machine, together with other apparatus, was unfortunately destroyed by fire a year ago, but will be reconstructed as soon as possible." - Nikola Tesla in "Detroit Free Press", 16 February 1896.

> ***"Electricity is an Extremely Valuable Therapeutic Agent, especially when utilized in connection with Hydrotherapy, Thermotherapy, and other Physiologic Methods.***
> ***In connection with other physiologic measures this agent is capable of securing most excellent results."*** *- Dr John Kellogg, MD in "The Battle Creek Sanitarium System", 1908.*

For further information on Electricity as a Biological Function, please read the Book: "Neuropathy Principles & Foundations of the Neuropathic Treatment", 2025.

Electricity and Life

"Scientific progress during the past 3 decades has perhaps surpass that of all preceding ages; but we are still in the kindergarten class when we compare what is known with that which is still to be discovered.

Of course there is nothing super-natural in the strict sense of the term, but many things remain unknown, although science is daily uncovering new and hitherto undreamed-of marvels.

There exist Great Cosmic Forces of which we still know but little.

Gravitation is one of these; we know something of its laws and the results of its action, but nothing whatever of its real nature.

Electricity is another; of this we know somewhat more, and we now recognize it in a variety of forms, as light, heat, chemical action, magnetism, etc., but its true nature is still a deep mystery.

Life-Force or vital energy is another great Cosmic Principle; thru its action electrons are formed into atoms, atoms into molecules, molecules into crystals and chemical compounds, and these into the bodies of plants, animals and of man.

We have no name for this force, but thru its action the great Cosmic Scheme of Evolution goes on.

In India they call it by a Sanskrit name - Prana.

Here in the Occident we have not yet officially recognized this force; it is quite unorthodox to even suggest that it exists - simply because we have not been able to measure and record it by our still comparatively crude laboratory instruments.

A few years ago, we believed in nothing but matter and force; today science recognizes the necessity of a third basic principle, Intelligence or Mind, without this we can satisfactorily account for none of the facts of the world in which we find ourselves.

Its manifestations in matter thru the Cosmic Forces give us at least a working hypothesis of life.

As Electricity has been the great field for the investigations of the past century so will the nature and manifestation of the Life-force be the source of the discoveries of the future.

Even today we may hazard a few statements regarding this hypothetical Prana or Life-force.

For example, it comes to us - **like all other active forces from the Sun.**

It is stored and transmitted by plants and by the oxygen of the air, and in the human body it appears to be distributed thru the great Sympathetic Nervous System to every organ and tissue of the body.

The Sympathetic nerves radiate from the Solar Plexus - our Sun-center.

If bacteria or poisons interfere with this circulation, as for example in infantile paralysis, the muscles from which the supply of life force is cut off, lose their power of reaction and wither away.

It is in this connection that we may study the action of certain electric currents as applied to the treatment of disease.

It would seem that certain types of alternating currents of high frequency and voltage greatly facilitate the distribution of this vital principle (Nerve-Force: Prana), and this explains the action of one of the most valuable of recent medical discoveries.

Nikola Tesla described in a magazine article the remarkable effects upon himself and his assistants resulting from their exposure to the action of alternating currents of exceedingly high-voltage and frequency during some research work.

He prophesied that when electrical oscillations were fully understood and applied by physicians that a universal healing agent would have been obtained - one which would so increase the vital energy and resistive reaction of the human body as to enable it to throw off disease.

The present writer, acting on this hint, constructed a high-frequency apparatus, tested it on a number of patients and reported his results to a local medical society in 1895.

So far as can be learned this was the first clinical work ever done with the Tesla current, altho d'Arsonval in Paris was then experimenting with his relatively low voltage currents, produced from 3,000 cycle alternators.

Later Apostoli, Denoyes, and others reported remarkable results from the currents induced in the bodies of patients placed inside of huge solenoids or wire coils thru which high frequency currents were passing.

The effects obtained were: increase of strength, appetite and weight, induction of natural restful sleep, and increase in tissue combustion and elimination.

Early in 1895, the author devised the first Vacuum Electrodes for applying Tesla currents to the patient.

Today thousands of physicians are using this device, often mis-calling it the Violet-Ray Treatment. This is of course a misnomer, the violet light in the tube having nothing whatever to do with the healing effect produced by the transmitted electrical oscillations.

Some years ago the great Swedish scientist, Arrhenius, was reported to have subjected one-half of a class of school children to the action of high-frequency currents, 1 hour daily for several months, at the end of which time, there was marked increase in the average growth, weight, general health and mental ability in the electrified pupils as compared with those not so treated.

High-frequency currents are actually being used in truck-gardens to promote the growth and increase the size of vegetables.

The high-frequency currents, in short, act as vitality boosters - no other form of electricity will do this. **Galvanism, Faradism, Static electricity are all valuable agents in the hands of the Electro-Therapeutic Specialist,** but they have little direct action in **promoting cell vitality and growth, as do the high-frequency currents when properly applied.**

Authorities explain the action of high-frequency currents in various ways, the favourite theory being that the healing effect is due solely to the liberation of heat in the tissues.

It is perfectly true that in many diseases the heat liberated in the body by the passage of from 400 to 2,500 milliamp-peres at a frequency of about one million cycles, **is an important agent in promoting an artificial inflammatory reaction and increasing circulation.**

The heat is, however, only one of the secondary forces generated by the current; there are many other factors in the vitalizing effect.

The thermic theory will, for example, not explain the increased growth of plants produced by the action of high-frequency currents of very high voltage and low amperage.

In medical practice often the most marked results are obtained by the use of Tesla currents of low intensity, but of exceedingly high potentiality.

The author can account for these effects only on the theory that these currents, when of proper frequency, are synchronous with the normal rate of sympathetic nerve vibration, and in this way increase the flow of the Pranic force thru which function and tissue growth are maintained.

High-Frequency Currents are now extensively used by the medical profession **to increase cell growth, metabolism and functional activity.**

They tend to normalize the blood pressure and are the only agents that are of real curative value in certain stage of Arterio-sclerosis (hardening of the arteries).

They greatly augment the defensive powers of the organism, enabling it to resist and overcome disease-producing agencies.

The prejudice against high-frequency currents on the part of many physicians may be attributed to the fact that they do not employ proper technique, or that they use an apparatus which does not admit the proper variation of frequency, amperage and voltage, in order to suit the requirements of the individual case." - Dr Frederick Finch Strong, MD, Lecturer on Electro-Therapeutics Tufts Medical School, Boston, in "Electricity and Life", Electrical Experimenter, March 1917.

> ***"Healing with the Clean Pure Beautiful Agents of Nature, is surely the one method of all which appeals to most of us, and deep down in our inner self, surely there is something about it that rings true indeed — something which tells us, this is Nature's way and is right. To Nature we look confidently for all the needs to keep us alive: Air, Light, Food, Drink and so on."*** *- Dr Edward Bach, MD, in "Wallingford Lecture", 1936.*

Life Without Light Is Impossible

"The Wonders of Electricity, might just as well be stated as: The Wonders of the Universe.

What is Electricity?

Most scientists now agree that: **Electricity is a substance composed of moving electrons, and made manifest to us by its magnetic, thermal, photic, and chemical effects.**

There is evidence to believe that:

The Electron Is The Prime Cause of All Life, and Energy.

The human body is the most delicate and complex apparatus.

Within its structure are contained electric generators, transformers of potential into kinetic energy, trillions of minute cells constituting minute batteries, surrounded and containing electrolytes containing cathions and anions.

Everything Has An Electrical System

Everything that lives; whether animal or vegetable has a well defined electrical system.

There is much evidence to show that: L**ife Without Light Is Impossible.**

In fact, all energy on this earth is derived from our sun, and solar irradiation is electromagnetic radiation, or electricity. **Solar Energy taken into the body becomes converted through biochemical changes into living processes.** Since chemical changes are due to and synonymous with electrical activity, then it follows that **without electricity there is no life.** Physiologists, are rapidly coming to the belief that **all living substances are electrically controlled and electrically driven. The wonders of electricity then, are the wonders of the universe; the wonders of life and death. Is it then, at all surprising, that the first chapter of the Bible should contain this command from the Supreme Source of All Energy:**

> ***"And God said, Let there be light: and there was light."*** *- Genesis 1:3*

." - Dr E. N. Kime, MD, in "The Wonders of Electricity", The American Journal of Physical Therapy, December, 1929.

> ***"The Effects of Sunlight as Essential to the Sustaining of Life, and the Curing of Disease are Undoubted. We now know Sunlight consists of the following light rays: Infra-Red, Red, orange, yellow, Green, Blue, violet, and Ultra-Violet."*** *- Dr Louis Feldman, MD, in "Actino or Ultra Violet ray Therapy", Principles of Physiotherapy in General Medicine, The American Journal of Physical Therapy, July, 1929.*

Life Is Electrical Energy

"Life is the result of bombardment of electron against electron; ion against ion; the quotient of never ending reversal.

This thing we call life is the summation of positive and negative.

The negatives are whirling at incredible speed around the positive in orderly, if eccentric orbits.

Life Is Electrical Energy; at least what we call electrical energy, without in the least really understanding what electrical energy is.

In this view science limits itself to the purely physical explanation.

We are no nearer the secret of creation, than at any other time, and the very complexity of each new discovery, makes it more difficult to understand creation.

What we can, and do say, is that **the assumption of the part which electricity plays in this thing called life, enables us to combat human ills a little better.**

The universe may be considered as filled with revolving, and possibly electrically propelled worlds, which range from the super solar system down to the ion.

All these things have a bearing on the new medicine.

The physicist and the physician must cooperate.

Physicists must learn to convey the facts known to them to the physicians, and some physicians must learn to translate, as it were, the fruits of the pure physicist into the field of physiology, of living matter in health as well as in disease. The world will be a better place to live in.

The concept of invisible ultraviolet sunlight into vital rays should not be ignored.

The "Light which shineth in darkness" - John 1:5, should be recognized and the effects of its vital portions sought to advantage by all." - Dr Herman Goodman, MD, in "The Light Which Shineth in the Darkness", The American Journal of Physical Therapy, June 1929.

Ionization

"In addition to its own physical action, Physiotherapy, and especially Galvanism, affords an excellent method. This is, indeed, one of the first and oldest uses of galvanism in medicine. **Medical ionization still remains one of the most valuable employments of electricity; and with our advanced knowledge of this agency, and our improved apparatuses for generating and applying it, ionization should have a wider and more effective field of usefulness than ever.**

Moreover, **with our present conceptions of chemical structure and chemical action, which no longer regards the Atom but the Ion, as the unit of these substances, and Ionic Association and Disassociation as their mode of activity, it would seem as though there should be a wide field for Research into the Chemico-Physiological Inter-Reactions Between the Various Radiant Energies."** - in "The American Journal of Physical Therapy", April, 1929.

Galvanism and Its Uses in Healing

"The Galvanic current is said to be the Grandfather of the electrical currents.

It is one of the oldest medical currents.

With the advent of the newer currents, as Diathermy (the use of high-frequency electrical currents, or electromagnetic waves to generate deep heat in body tissues; promoting increased blood flow, reducing pain, relaxing muscles, and speeding recovery for musculoskeletal conditions: sprains, strains, arthritis, and chronic pain), Ultra-Violet, and Infra-Red, it has been to a certain extent, forgotten. It is, however, a valuable form of physical therapy, and has many good uses. It is a constant or direct current, that is, it flows in one direction only.

It possesses a Positive, and a Negative pole (polarity), and it flows from Positive to Negative. This is important to remember when using it for treatment.

When this current is applied to the human body its action is chemical.

The body may be compared to a large sac filled with fluid, which fluid contains the various salts of the body. When this current is applied, due to its chemical action, it splits up these salts into their different constituents, the metallic portion being attracted to the Negative Pole and the acid portion being attracted to the Positive Pole. This redistribution (movement of ions), causes tissue changes, and is summed up in the word Metabolism.

To Test for Polarity: Place both Positive and Negative Poles in a glass of water; the one that begins to throw bubbles (Hydrogen) first is the Negative Pole. Both the Positive and Negative Poles of the Galvanic current have definite properties, upon which we depend for our results.

It is the chemical current used in medicine. The Positive Pole accumulates acids, is vasoconstrictor, it hardens , and shrinks tissues. It also dries and dehydrates. It is soothing and sedative. It repels metals and alkaloids. While the Negative Pole may be said to do the opposite. It attracts alkalies. It is a vasodilator, it is softening to tissue, thus giving it a tendency to cause hemorrhage. It breaks down tissues. It is irritating and liberates hydrogen. It liberates the halogens.

These effects are always the same, no matter where and how galvanism is obtained, whether from dry cells or electrical machines.

In applying this constant current, therefore, to a pathological condition, it is very important to use the correct pole. As an illustration, take an endocervicitis; here the cervix is swollen, edematous, congested, with a stringy discharge from the mucous membrane. We know the positive pole shrinks tissue, hardens and dries, just the effect we are looking for in the inflamed cervix.

This, therefore, is the pole to use in treating this condition.

There are many conditions where galvanism can be used.

This can be done with the galvanic current, because the drug is forced into immediate union of the protoplasm of the inflamed cell.

A condition where medical ionization can be used is in a hypertrophied or ankylosed joint. The iodine ion should be used here.

To soften scar tissue the iodides, or the chlorides can be used. In a rheumatic joint, the salicylates can be driven in. The flooding of a part with a drug is lessened, however, if the circulation is active, and if the skin is sensitive.

Medication by mouth, and ionization to a pathological area, will certainly hasten recovery. It is held by many men that deep medical ionization is impossible, and that only in the superficial layers of the skin can the driven in drug be found. Personally, I am of this same opinion. The positive pole drives in metals, as silver, copper, and the alkaloids. The negative pole drives in the halogens, as Iodine. As a pain reliever, especially in some sciatica neuritis, the galvanic current was the only therapy that gave relief. The positive pole was applied to the back and the negative to the foot. Besides the galvanic polarity effects, there is also an increase of temperature between the pads, probably a frictional effect upon the cells from the passing of the electric current. Such an increase in temperature leads to an increased blood supply, and as such, increased nutrition and cellular activity can be expected. The best results are obtained with the galvanic in the chronic cases.

Another most important use of the galvanic current is in the wave form, for the use of paralysis. In peripheral paralysis our main dependence is upon exercise and Massage. As you know, if a nerve is completely degenerated there will be no response with the Faradic current.

The Galvanic, however, offers hope, as the muscle will respond to an interrupted galvanic current, thus giving it a chance to keep from growing flabby and atrophying from nonuse. When the galvanic current is made to pass through a nerve and muscle preparation the muscle contracts at the instant the current begins to flow, and again at the instant it is interrupted. During the time the current is flowing no muscular contraction is produced.

Therefore, only the change in the intensity of the current from moment to moment is stimulating. Galvanism, therefore, is an excitor and stimulator of neuromusculature tissue. It, therefore, does what Faradic and other induced currents cannot do, in dealing with atrophy and wasting muscle incident to peripheral nerve injury.

Bearing the Positive and Negative effects of the poles in mind in the waveless form, it is understood that this current has various uses, and briefly may be said to:

1. Introduce drugs into the system (ionization)

2. Relieve fatigue by removing waste products through, changes to and fro of the ions in the tissues (Metabolism).

3. Alleviate pain through sedative effect, upon sensory nerve endings.

4. Destroy tissue.

5. Reduce hypertrophic tissue.

6. Produce muscular contraction when used in the interrupted form.

7. Allay various inflammatory states.

8. Relax and break down adhesions." - Dr N. J. Seybold, MD, in "The American Journal of Physical Therapy", April, 1929.

Clinical Applications of the Diathermic Treatment in Gastrointestinal Conditions

"Clinical applications of the Diathermic Treatment in Gastrointestinal Conditions. Interesting results have been published by many authors.

Their indications may be stated in the following manner:

I. Diseases in which painful phenomena are prevalent, such as:

1. gastralgy and gastric attacks (Tabes).
2. painful dyspepsy and gastritis.
3. solar syndrome.
4. chronic appendicitis.

II. Spastic conditions such as:

1. cardiac spasm.
2. nervous pyloric spasm in adults.
3. pylorospasm of the newborn.
4. aerophagy.
5. nervous vomiting.
6. spastic constipation.

III. Conditions having a secretory origin such as:

1. Hyperacidity chronic gastritis.
2. Certain cases of gastric and duodenal ulcers.
3. Mucous colitis.

IV. The phenomena involved in peritoneal inflammations:

1. Epiploitis,
2. Perivisceritis, and
3. Adhesions, are favourably influenced by diathermy.

A man aged 56 was brought in March 1927, to the Hotel-Dieu Hospital in Lyon, France, to be treated for a stomachal disease (pyloric cancer suspected).

In 3 months he had lost 20 kilos, appetite and strength. Then appeared epigastric pains, occurring daily after the 2 principal meals, and more recently vomitings which came periodically and calmed the pains. The symptoms increased little by little in gravity till the man was brought into hospital.

He could scarcely eat anything. He became so weak that he could hardly speak, suffered continually though not excessively, and continued to vomit.

A complete examination revealed neither tumor nor pyloric obstruction.

The patient was put under my care in order to try the application of a diathermic treatment on the stomach. From 8 to 15 March, I gave him 8 treatments according to the ordinary direct method, that is: a tinfoil epigastric pad (10x20 cm), another pad (15x25 cm) on the dorso-lumbar region.

A current of 600-1,000 mA intensity was given during 15 to 30 minutes.

After the 4th treatment the man felt an amelioration. Pain was lessened, vomitings became less frequent, and the appetite reappeared. After the 7th treatment, his strength revived, his appetite was considerable, pains were insignificant and vomitings absolutely ceased. When the patient left the hospital, 10 days later he declared himself completely cured. He had gained 5 kilos in 3 weeks, and **all symptoms had disappeared.** Two months after he had left the hospital, the man had gained 12 more kilos. There only remained a slight degree of physical weakness. In August, 3 months later, I heard from his doctor who wrote to me: **"Is now perfectly well; he has gained his normal weight, and offers no more symptoms. The clinical examination is negative".**" - Dr A. Mirimanoff, MD, Geneva, Switzerland, in "The Influence of Diathermy on the Gastro-Intestinal Tract", The American Journal of Physical Therapy, April, 1929.

Lighting and Its Effects on Behavioural Problems

"During the 1972-1973 school year the Environmental Health and Light Research Institute of Sarasota, Florida, undertook a study of the Effects of Lighting on Behavioural Problems of first grade students. In a pilot project conducted in 4 windowless elementary classrooms. Children **showed dramatic reactions to an Improved Lighting Environment.**

Under their Normal Classroom Lighting, some first graders in the study Demonstrated:

1. **Nervous Fatigue**
2. **Irritability**
3. **Lapses of Attention**
4. **Hyperactive Behaviour**

After Full Spectrum Lighting was installed, with lead foil shields over the cathode ends of the fluorescent tubes to stop suspected soft X-ray, and an aluminum screen grid over the entire fixture to stop known RF radiation, which is characteristic of all fluorescent tubes, **a marked improvement appeared in the youngsters. Without any use of drugs, the first graders settled down and paid more attention to their teachers. Nervousness diminished and teachers reported that overall classroom performance improved."** - in "Ecologic-Biochemical Approaches to Treatment of Delinquents and Criminals", 1978.

The Importance of Sunlight to Health

"The Recognition of the Dependency of Health on Sunlight is part of the inherited experience of Mankind.

We are now gaining more exact knowledge of the nature of this relationship and the conditions which influence it.

The beneficial effects of exposure to the Sun's Rays have been demonstrated in such diseases as Surgical Tuberculosis, and Rickets, and the result is seen not only in the direct effect on the obvious disease, but in a general stimulation of body growth.

The Importance of Sunlight to Healthy Growth is increasingly realized and the rearing of healthy children requires that they should not be deprived of what is so essential to their well-being." - Chief Medical Officer, Ministry of Health of England, in "Annual Report on the State of the Public Health", 1927.

Sunshine Is An Important Biodynamic Agent

It promotes:

1. Anabolism
2. Transpiration
3. Respiration
4. Increases the percentage of Hemoglobin

The Blue and Ultraviolet Rays of Sunshine:
Exert a bactericidal effect on pathogenic bacteria, and a Tonic, Vitalizing Influence on the Feelings.

Colourless Daylight:
Is superior for visual efficiency and Eye Health.
Dark clouds have a Depressing, Devitalizing Effect.

Humidity:
Increases the solid, poisonous, bacterial contents of the air, aggravates various pathological conditions of the body, reduces the sensitivity of some sense organs, and depletes the vital potential.

Fogs:
Increase the inaccuracy of mental work, the prevalence of diseases, and augment the death rate.

Clear Dry Days:
Are anabolic in character and thus produce a superabundance of energy.

Liefman concludes that **Darkening of the Atmosphere of Cities is Injurious to Health in 3 ways:**

1. An exciting impulse which influences our disposition is weakened and the energy of metabolism, especially as it concerns respiration, is diminished.

2. The illumination and warming of the earth, the water and the air within the precincts of our great cities is diminished, and in this way a series of hygienically important processes is influenced or depressed.

3. The chemical and bactericidal effect of the sun's rays is decreased and thus bacteria, especially the pathogenic ones, are permitted to thrive. (Wellow Inst. Bull., No.9)

> ***"Smoke is harmful by its power to absorb light directly, and by its effect in the formation of clouds and fogs which are peculiarly fitted to absorb the Blue, the Violet, and Ultra-Violet Rays, these being the Rays that are especially Germicidal. Diminution of Sunshine causes an increase of bacteria in the atmosphere. Sunshine has a direct influence on the Human Skin, as well as upon the Mental State."*** *- Sir William Ramsay*

Vision, Illumination & Ultra-Violet Rays

Cutting off Sunshine, and sky-shine (clouds reflect light), makes it necessary to use artificial light with its detrimental effect on vision.

Smoke acts as a curtain, and cuts off the Sun's direct Rays, **Ultra-Violet Rays which are Necessary for the Healthy Development of both Plants and Human Beings.**

Rickets, Anemia, and Tuberculosis are likely to Develop in children who are Deprived of Sunlight.

Sir John Robertson, C.M.G., Medical Officer of Health, Birmingham, in his Annual Report for 1926, dealt at length with the **smoke nuisance and its effects, and said that the extent to which the products of Combustion are in the Air of any large city, and its influences:**

> ***"It is Prejudicial to Health and it Limits the Growth of many Plants."***

By far the most important of these, is the fact that all smoke or dust in the air shuts out, in direct proportion to its amount, the ultra-violet rays, and prevents them from reaching the dwellers in the area.

> ***"The absence of these rays for the greater part of the day lowers vitality, and by so doing renders most people susceptible to ailments which they themselves would not associate with the absence of Sunlight. This deleterious effect, is for the most part produced by the very light and minute particles of soot which are carried high up in the air, and form by their presence an effective barrier to the sun's rays. It is possible to demonstrate this even when with unaided eyes the sun looks clear over the city."***

McCollum of Johns Hopkins, **has shown that the Growth Producing Factor, Vitamin A, and the Anti-rachitic Factor in Cod Liver Oil, are Not The Same and the latter has been designated Vitamin D.**

Respiratory Diseases

The inhalation of carbon particles, irritating fumes, and other atmospheric impurities irritate the mucous membrane of the nose and lower its resistance, thus rendering it liable to acute and chronic infections which may involve the ear. Irritation alone can produce congestion of the mucous membrane, secondary swelling of the turbinates, and vacuum frontal sinus headaches.

Patients in whom the membranes are diseased, and the ciliated epithelium destroyed, have great difficulty in eliminating the irritating particles and are therefore more sensitive to atmospheric pollution. In addition to this there is no doubt that some patients can be sensitized to certain forms of Air Pollution with the usual Allergic Manifestations. According to Doctor Henning of Leipzig, enlargement of the tonsils is common in firemen because of the irritating effects of smoke. Redness and congestion of the pharynx and larynx and tendency to inflammation of these tissues are predisposed to by Atmospheric Pollution.

Effect of Air Pollution on the Lungs

> ***"During periods of winter fog owing to certain barometric conditions and absence of wind, smoke cannot get away but accumulates in the lower air strata. As a consequence the proportion of impurity is enormously increased and the concentration of sulphuric acid in the air may be such as to cause irritation of the eyes, nose, and respiratory passages. It is a common experience of local medical practitioners to find their bronchitis patients dying in numbers during prolonged periods of winter fog. I would like to invite attention to a very striking correlation which emerges from a comparison of health statistics for the year 1926 with previous years. The general death rate for the year (12.5 per 1,000 living) is the lowest ever recorded for Salford. The greatest reduction of mortality occurred in the great group of Respiratory Diseases, and this fact associated with the occurrence of the prolonged coal dispute and consequent relative purity of our atmosphere, is a matter of some significance."*** *- Doctor H. Osborne (Medical Officer, 1928)*

H. K. Kugel, Acting Commissioner of Smoke Inspection, Cleveland, writes that the survey made by the Mellon Institute several years ago in Pittsburgh seemed to show that in certain **parts of the city which were the smokiest, diseases of the respiratory tract were much more numerous.**

It is interesting to note that the Annual Death Rate from Pneumonia is greater than from all other infectious diseases combined.

Smoke Irritates the Mucous Membrane, and predisposes to Diseases of the Respiratory Tract, especially Pneumonia.

Taylor says, as a result of inhaling about 35 lbs. of air daily, dwellers in the industrial cities have lungs more or less similar to those of the coal miner, not pinkish in color like those of a child or one who tills the field, but blackened, both on the surface and in the depths, due to the deposit of carbon. The tarry matter and the less visible sulphur acids which are far more dangerous than the carbon, set up an irritation in the mucous lining of the windpipe and smaller tubes. **Chronic Catarrh supervenes.**

The mucous lining becomes rough and thickened, the surrounding tissues lose their elasticity and become leathery in texture. These changes produce symptoms of **Chronic Bronchitis, symptoms resulting from persistent irritation, partial collapse of the lungs, and incomplete Oxygenation of the blood.**

> *Dr W. A. Brend has examined the main factors which might be held to account for a high rate of infantile mortality and finds that differences: "Neither in poverty, bad housing, insufficient feeding, defective sanitation, disease, industrial occupation of women, nor malnutrition of mothers can be regarded as adequate to explain the* ***excessive and widespread Difference between Urban and Rural Rate of Infant Mortality."***

Dr Stevenson believes that chances of survival differ but little at birth in town and in the country, but the **noxious influences of the former soon come into play, and make themselves felt to an increasing extent as the first year of life progresses, and to a still greater extent in the second and third years.**

Brend believes that the noxious influence is "a smoky and dusty atmosphere, and that as a cause of infant mortality it transcends all other influences", and if **one of the main effects of soot (impure carbon particles) is to cause Bronchitis, and lower the resistance of the respiratory organs,** then his argument is borne out by such figures as these:

Roughly 1/12th or all the deaths in England and Wales are due to respiratory diseases.

In Manchester the respiratory death rate is twice as great. For all rural England the Infantile Death Rate for 1928 due to Pneumonia and Bronchitis was 8.8, for the county boroughs 16.27, and for Manchester 23.16." - in "Effects of Air Pollution on General Health", Bulletin of the New York Academy of Medicine, September 1931.

The Influence of Ultraviolet Light Upon Circulation

"The effect of the universal arc-light-bath (also that of the sun-light acting as a climatic factor), upon the principal functions of the human body.

Evidence has been brought forward to show, that tile minute volume (output per minute) of the heart at rest in the sitting posture is a function of the respiratory metabolism.

Independent of variations in the metabolism the minute-volume as well as the output per beat is influenced by the arc-light-bath.

The primary effect (on the next 2 or 3 days), of the light-bath is in almost all cases an increase in the blood-flow." - in "Concerning the Influence of Ultraviolet Light on the Circulation in Man", Skandinavisches Archiv Für Physiologie, 13 February 1913

The Usefulness of the Treatment of Electro-Therapeutics

"Those who aspire to Mastership in Electro-Therapeutics will not be content with the mere attempt to relieve symptoms; they will seek to study those most complex and subtle diseases for the treatment of which electricity is indicated;

They will resort to this force for diagnostic as well as therapeutic aid;

They will strive to know not only how to use it, but, what is more difficult, how not to use it.

He only can reap the full and rich harvest of Electrotherapeutical Science, and art who sows beside all waters.

He must become proficient in Neurology, in Electro-Physics, and in Electro-Physiology.

He who has a knowledge of the Laws of Animal Electricity, and the Actions and Reactions of Franklinic, Galvanic, and Faradic Electricity on the Brain, Spinal Cord, and Sympathetic; on the Nerves of motion and of common and special sense; on voluntary and involuntary muscles; on the skin, and on all the various passages and organs of the body in health, and also of the electro-conductivity of the body.

Will find the paths of Electro-Diagnosis, and of Electro-Therapeutics illumined at every step by such knowledge, and will, in the end, make more correct interpretations of disease than he who merely holds electrodes on patients without any higher aim; and more than that, he will be introduced into a field of thought and experiment (a field surpassingly rich and fruitful), and lying in close relation to all departments of Physiology, of Pathology, and of Biology, where he can study science for its own sake." - Dr G. M. Beard, MD; Dr A. D. Rockwell, MD, in "A Practical Treatise on the Medical and Surgical Uses of Electricity", 1883.

The Effects of the Diathermy Current

"Diathermy is used in 2 distinct forms:

1. To Conserve Tissue, and restore organs to their primary function; and
2. To Destroy Abnormal Tissue.

The first effect of the Diathermy Current, is to create a rise of temperature, and a hyperemia in the tissues under treatment.

This induces improvement in the circulation, and influences beneficially the surrounding structures to a limited degree.

In the Treatment of Certain Forms of Deafness by Diathermy we are able to accomplish results which cannot be achieved in any other way, 5 to 15 minutes application should be made-according to the effect produced.

As a rule improvement in hearing should be noticed in from 6 to 8 Frequent Treatments, and then it is advisable to extend the periods, being guided by measurements of hearing acuity.

When the limit of improvement has been reached the applications should be continued once a week; once in 2 weeks, or once a month, to insure permanence.

We do not always confine our Treatments to Diathermy alone.

In many cases Electrical Massage, by means of the Sinusoidal Currents is helpful, or Mechanical Massage with an Electro-Vibrating Apparatus (to apply vibrations to the external auditory canal).

My preference in most cases is the Surging Sinusoidal Current used for 3 to 5 minutes after Diathermy." - in "Diathermy in Otolaryngology", The American Journal of Physical Therapy, June 1931.

A Note on the Treatment of Diathermy

The Treatments of Diathermy are most helpful to the body, from 30 minutes to 1 hour, once a week.

These will allow the electrical forces, from the low form of electrical vibration, to become more effective with the circulatory forces of the body, thus making for the better general conditions.

Thus, Diathermy Treatments, can change the axes of the whole system as to make for the Proper distribution of energies, that will aid to overcome some conditions.

Diathermy can be applied to several body areas, including the Cerebrospinal System, and to the trunk portion of the body.

Diathermy should not be given of too high a frequency when it is applied, rather the Low than the high.

Concerning Light Vibration Diathermy

Light diathermy: These should be applied, not for long periods, but for periods of 2 or 3 days at the time.

These Treatments can be taken 2 or 3 days, then rest from same 2 or 3 days or a week, and then applied for 2 or 3 days more. Then have a rest period, and then apply again. Not the heavy but the Light Vibration; not too great an amount of current or quantity used, but the light.

After the 3rd, 2 to 3 day period of treatments, begin with the General Massage over the system; given in a Neuropathic nature, rather than Chiropractic or Osteopathic. Give these for periods of 2 to 3 weeks. Begin in the central portions of the body along the Cerebrospinal System, and follow out the nerve plexus of the 9th dorsal to the lower extremities, also to the upper extremities.

These would work either way from the central or middle portion.

The reactions of these for the body will be to make for the less tendency for acidity in the system, that becomes a hindrance to the body in the proper assimilations; making for better eliminations through the alimentary canal, through the activities of the hepatic circulation, through the general respiratory system and the activities of the digestive forces themselves.

These can be keep for periods of 2 to 3 weeks, then have a rest period from same for a period and then begin again.

Diathermy Treatments can be applied to those centers that will make for increasing the circulation; or the 3rd and 4th dorsal center, and the lacteal duct, or the umbilicus center. In regards to Deep Diathermy Therapy in pelvic organs, by changing the vibrations first, will make for electrical vibrations through same. Then the Massage will make for greater corrections in all functionings.

In the application of those forces in the Diathermy, that produce for the body the opening of the flow of effluvia, or of the blood supply and the lymph circulation, through those portions above the liver area, and the kidneys, and lumbar plexus. This applied for 10 to 15 minutes, about 3 times each week.

It is of benefit, that the days that the Diathermy Treatment is taken, After the Diathermy Treatment there should be applied the Corrections, and Manipulations, Osteopathically.

Electricity Is To Fill A Great Place In The Future

"For the relief of the large class of unfortunates (health conditions) included in this section of our journal, it is a recognized fact that the physical measures-Electricity, Oxygen, Hydrotheraphy, Therapeutic Exercise, and the various appliances for support-afford the chief means of relief. For the treatment of deformities, congenital or acquired, adapted appliances, with Electricity and Exercise to Maintain the Nutrition of the Parts, meets the requirements of a very large class.

Surgery is required in others, but must always be supplemented by some of the above measures. The paralyses, from whatever cause, call for two of the measures in all cases when any hope of improvement is entertained-electricity and exercise. When it is realised fully, as it soon must be, that Electricity is to fill a great place in the medicine of the future, and the men who stand high in the councils of the great medical colleges, and who themselves from neglected early education know little or nothing of the subject, begin to see that it is not to be ignored, then, and not until then, will the education of the younger medical men in this department receive attention, as it does today in subjects of far less significance. When men who are not well informed in the employment of Electricity realize that it is a dangerous agent in ignorant hands, and not until then, will the rewards it so well merits from skilful employment place this valuable measure in its proper sphere as a therapeutic agent. Not alone does ignorance exist in the use of Electricity, but the same is equally true of the employment of Oxygen, Hydrotherapeutic Measures, Therapeutic Exercise, and Light-Natural measures which should appeal to all. There are other methods which, while receiving more attention, perhaps, than Electricity, that have not been given proper significance in the great medical schools of the world. Natural measures will very largely constitute the physician's means in the future. Imbued with the truth of the last statement, leading physicians, who have devoted themselves to the study and scientific employment of the measures properly constituted as physical measures, have founded a school for post-graduate instruction." - in "The Journal of Advanced Therapeutics", 1902.

Counter Indications for Electro-Therapy

1. Pacemakers.
2. Electric Insulin Pumps.
3. Drug Injection Devices.
4. Electronic Wearables, either: In or On the Body.

Individuals with: Pacemakers, Electric Insulin Pumps, Drug Injection Devices; Are Absolute Counter Indications for High-Frequency Healing Devices, also being in the vicinity of their use. This also applies to any other Electronics in or on the body, they will be disturbed! High-Frequency Healing Devices, also interfere with other electronic devices such as: Phones, Watches, and Computers. The more so with the extremely Powerful High-Frequency Devices.

Safety Precautions

It is best to stand on an electrically non-conductive surface: Wood, Stone, Linen, or Rubber. Use a protective device between the power supply, and any High-Frequency Healing Device apparatus. This can be a ground fault circuit interrupter, or a fused outlet; Isolating transformer are the best.

Chapter 5

Colour Therapy

*"**Colour Is A Curative Power.**" - S.G.J. Ouseley, in "The Power of the Rays: The Science of Colour-Healing, 1986.*

The Vibratory Forces of Colour

Colour is Vibration: Vibration is the essence or the basis of colour.
Vibration is movement. Movement is activity of a positive and negative force.
All force is created by vibration.
We know that all vibration becomes electrical in its action and its effect.
Vibration is another phase of colour, of and of tone.
For, as has so oft been given, and as demonstrated in the experience of the Great Physician, He met the needs of the individual, whether by the spoken word, vibration, or application of means that attune, the dissenting tissue or body to the divinity that is in each soul, each body who has acknowledged, who lives in the Christ Consciousness.
For, returning to the first principle; as there are those forces that move one within another to bring harmony, as for light or colour, or sound, or motion, all of these are but the variation of movement, vibration.
What is the First Cause?
That from which all emanates, the Spirit of the force or influence itself; breaking itself upon the atomic structures about same, bringing those influences as it associates itself one with another in its varied forms of atomic structure.
For it is not strange that music, colour, vibration are all a part of the planets, just as the planets are a part, and a pattern, of the whole universe.

Colour Therapy is the application of both Light and Colour in the Treatment of certain health conditions; both physical and mental, by the use of various Colour Rays.

The principle of Colour Healing, is the vibrational increase of the physical and etheric cells, with the aid of a Colour Rays.

Is important to realise that Colour, like other Forces and Energies in Nature.

Is Either:

1. Positive, and
2. Negative

In Its Effect Either:

1. Beneficial.
2. Harmful.

It is of the utmost importance that we should cultivate the right colour vibrations, in and around our bodies and surroundings.

> ***"In my laboratory work I have exposed microscopic cells, of various organisms, such as Algae, Infusoria, Yeast, Bacteria; to either direct or diffused sunlight as well as to various types of artificial illumination through colour filters of various wave-lengths. The specimens are placed in individual dishes covered with coloured glass or gelatine, transmitting only a selected range of light. Ultimate Results have proved that each colour has a specific function to perform in the development of normal life: and that this life-promoting, biological potency is contained within a particular range of intensity; correlated to certain elements contained within the Protoplasm (Basic Life-substance), and which under the stimuli of that colour become actively potent."*** *- Maryla De Chrapowicki, in "Spectro-Biology, Light and Colour Therapy", 1938.*

"It cannot be denied that the cures obtained by the Agencies of Colour and Mind, stand out as living witnesses of the power that is wielded by them.

We have heard much of: Sun Baths, Ray Treatment, Electricity, Radiant Heat.

And it is gradually becoming recognised that the finer and especially the etheric forces of Nature, are of more avail.

The famous American Colour Scientist, Dr E. Babbitt, patented an apparatus which he termed the **Chromolume, designed to transmit the Sun's Rays through Coloured Glass.**

> ***"Chromolume, which means literally colour-light. Its colours being arranged very much on the law of harmonic contrast, as well as according to the principles of chemical affinity, it constitutes one of the most beautiful ornaments imaginable for a drawing-room, or bed-room window, and certainly one of the best of all instruments for vitalizing, healing and toning up the human system."*** *- in "The Principles of Light and Color: the harmonic laws of the universe, the etherio-atomic philosophy of force, chromo chemistry, chromo therapeutics, and the general philosophy of the fine forces, together with numerous discoveries and practical applications", 1878.*

It is perhaps sufficient for the ordinary reader and healer to understand the main points of the theory and then to pass on to their practical application.

The source of all terrestrial life: the Sun; contains within it practically everything of which the earth (and its inhabitants), are composed, and if there be any potency in drugs that potency is intensified by coming direct from this centre of Life and Force.

It is therefore not surprising to find that the colours which the Spectroscope reveals are indicative of various metals and gases given off in the form of others varying in intensity and quality, some of these colours being termed heat or thermal colours, and the others cold or electric.

Coloured glass hinders the passing through of certain rays and when these are precluded interesting results are effected.

Experiments have shown that **plants grown under Red glass shoot up 4 times more quickly than in ordinary Sunlight, and that slower growth occurs under Green or Blue glass.**

It is well known that in Nature heat associates itself with Red.

In diseases heat is expressed by redness, as in inflammation, fevers, etc.

In the emotions, people turn red with passion and anger.

Disease Is a Want of Harmony in the System.

The best length of time for a Colour or Ray Treatment is 30 minutes or less.

The practical application of Colour to the human body falls into 2 divisions:

1. General diffusion.
2. Local concentration.

In treatment by general diffusion the method consists in focusing the light rays all on the body, with special reference to the back.

It is excellent as a general tonic for recharging the tired cells with new vitality.

The patient should either sit or lie down in a relaxed position, stripped to the waist, and should be wholly immersed in the light for 30 minutes.

The great value of Colour Therapy as a remedial agent lies in the penetrative power of light.

Light and colour have a direct action on the protoplasm of the body; the speed and power of the chemical and other reactions depend upon the biological state of the organism.

Scientists are of the opinion that the penetration is simply a process of osmosis (permeation of the cells).

But the generally accepted view is that light and colour penetrate and influence the body activity by arousing sympathetic vibrations within the organism.

In other words Light and Colour work according to the Law of Attraction.

As most students are already aware, all physical bodies are components of electro-magnetic points of energy or elements in a refined state of rarefication.

Concisely speaking, Health Is The Condition of Perfect Equilibrium Between These Elements; but that Equilibrium is only maintained as long as there is perfect rhythm and harmony throughout the organism.

In studying the nature of Light, it is important to remember that all radiations emitted from a luminous body travel through space in perfect rhythmic vibrations in the form of waves. Each atom and cell is a living thing with its own conscious life and each group or aggregation of such atoms and cells into a more complex being is again a living entity.

The Cosmic Rays and The Forces of Colour which play upon our physical bodies Affect the Condition of the Physical, and Etheric cells and atoms; Some Groups of Cells Are More Influenced By Certain Colour Rays Which Affinitise with them, than by others.

"Light and Colour", said the philosopher Bacon "demand investigation before form, for Colour is Life."

Pythagoras declared that there is: **"One Universal Soul permeating all things, which in substance resembles Light."**

The splendid Symphony of Colour which we see manifested on all sides of the universe, is the visible expression of Divine Mind. It is the cosmic manifestation of the One Life Principle in the form of Light-waves." - in "The Power of the Rays: The Science of Colour Healing", 1963.

"The Light Cure is Nature's own, professed Dr Babbitt who utilized the sun's energy rays to their fullest capacity to heal and cure the afflicted among his many followers. The Concentration of a Specific Colour Stimulates Secretion of the Corresponding Glands to that colour which flows through the diseased area, Bringing about Balance, Harmony and Restoration.

Colour works through us, in us, in every cell, nerve and gland!

It is an active power exerting a great influence upon the consciousness, soul and spirit. The value of this force "is spiritual", states Dr Babbitt.

Absent and Mental Healing are also applicable through the Treatment of Colour. With Absent Healing, the healer pictures, in his mind, a specific colour required to aid the afflicted area. This process operates by use of the consciousness concentration of a specific Healing Ray, and by Projecting its Vibratory Healing Power upon the patient.

A mental Colour Treatment embodies great beauty and power.

Through mentally concentrating on the power and effectiveness of a specific healing ray, the healer also transfers this balancing and harmonious colour treatment to the individual. It provides great benefits to both healer and patient, as is generally the accepted case in most spiritual healings.

In Arthur Findlay's The Unfolding Universe he reminds us that:

> ***"Life, then, is largely made up of our being conscious of colour."***

" - in "Color - Its Healing Properties", IAPSOP, 10 March 1979.

The 3 Most Useful Colours in Colour Therapy

1. Green Light (Green Is The Healing Vibration, for the Green Glass deflects certain Rays that cause Greater Healing power from the Ultra Violet Light for meeting the wasting or destructive forces in the human body).

2. Infra Red Light (Electricity of the Low Form; 20 to 30 minutes maximum).

3. Violet Ray (Hand Violet Ray; 15 minutes maximum).

4. Ultra-Violet Light (1 to 2 minutes maximum, 100 cm away from the body).

5. Ultra-Violet Ray (Mercury Quartz Light, 4 minute max., 100 cm away).

6. Blue Light (those of the Blue Light, or that Termed the Infra Red But Reflected Through Prisms so as to receive the Blue Rays, even of the Infra Red).

Colour, Light And Vibration

"Spectrobiology studies the universe in the elementary terms of Colour, Light and Vibration.

How Light Generates Life

Spectrobiology, in its ongoing attempt to grasp How Light Generates Life, has indicated the extraordinary Importance of the Length of Light Rays (that is, the colours of the spectrum) which strike and invade "inert" matter.

We breathe in an ocean of electromagnetic waves; Our Physical Bodies Are Electromagnetic Bodies.

In a simple minded way this is what we're getting at when we speak of solar energy, the very energy that activates the chlorophyll in plant leaves.

And because the planets and our atmosphere refract the solar energy (both the sun's rays and its magnetic field), we might well say the planets affect us through their colour; an easy example is the planet Mars, which we see as Red.

Red is a Colour that Stirs Us. The planet has come to represent the many degrees of aggressiveness in man's nature, and has thus been accorded, through the ages, this influence." - in "Beyond Astrology", Harper's Bazaar, 1968.

The Solar Spectrum

Positive and Negative are opposite ends of a Spectrum, with Neutrality at the midpoint.

"The Solar Spectrum is to be understood as a Biological Unit, in which Green occupies a middle position in terms of wavelength and frequency of vibration, representing the zero point, so to speak, while Red and Violet oppose each other, balancing each other as antagonists.

Red is long-wave, sluggishly vibrating, warming, biologically and chemically inactive, and spiritually stimulating; Violet, on the other hand, is short-wave, rapidly vibrating, biologically highly active, and spiritually calming.

Animal and Plant Life Require the Effects of Both Rays, and The Healing Power of Light Is Based on the Interaction of Both Types of Rays." - Franz Thedering, in "Die Naturwissenschaften", 21 November 1924.

Painted Glass Windows in Churches

"Reds, Yellows, Blue, Green in Glass painting (especially when the sun shines) does much refresh the Spirits.

After this manner did Dr R. revive the spirits of a poor distracted gentleman; for whereas his former Physician shut up his windows, and kept him in utter darkness, he did open his window-lids and let in the light, and filled his windows with glasses of curious Tinctures, which the distempered person would always be looking on, and it did conduce to the quieting of his disturbed spirits.

Dr Sanderson said (speaking of church music) in short, whatever does tend to the quieting of the mind and contemplation, tends to Devotion.

Johannes Medicus, who lived and wrote in the time of Edward II, and was Physician to that king, gives an account of his Curing the Prince of his Smallpox by ordering his bed, room, and his attendants to be all in Scarlet, and imputes its Cure in great measure to the virtue of that colour.

The same was done in the case of the Emperor Francis I, in 1765.

Of Red it is certainly true that it is a warm colour; and the impression of it on the mind is stimulating.

Experiments have shown that Different Colours Exert Various Influences over living forms, including man." - in "Medical Symbolism in Connection with historical studies in the Arts of Healing and Hygiene", 1891.

The Healing Power of Light

"We live in the age of light, of electrical light.

This not only serves as illumination, but is also used for healing purposes.

But we are not dealing with that kind of light here.

We are dealing with Sunlight, whose healing power is still far too little appreciated and used.

Spring, with its mild Rays of Sunshine, is the best time to use Light as a Healing Agent, as a Spring Cure.

Anyone suffering from Rheumatism, or Gout should sit in the sun with the aching limb as often as possible, let the Mild Sun Shine on it for at least 1 hour, and he will notice to his joy how Beneficial, how Healing and Pain-Relieving the Sun's Rays can be.

Anyone who is Convalescing, or Suffering from Nervousness should seek out the sun, lightly dressed if possible, and sit for 1 or 2 hours, exposed to the sun. Very soon, they will feel strengthened and calmed.

With this Healing Method, only the head and eyes need to be protected from prolonged sun exposure, i.e., with a hat with a wide brim.

The Light Healers of our time, like to pretend they had discovered the Healing Power of Light.

But as early as the 18th century, the great German physician Hufeland healed with light. **Light is just as Important for Health as Clean Air.**

Humans are among the creatures of light: they cannot endure darkness in the long run. The human brain is a light organ, which sleeps during the night and needs the stimulus of light to fully awaken again.

People who are kept in dark rooms for long periods of time suffer from physical and mental deterioration.

Many people have already gone mad through prolonged, violent deprivation in dark dungeons. Sunlight attunes human nature to greater nervous activity, to greater reactivity, to a more joyful spiritual state.

People who turn day into night and day into day live contrary to nature and sooner or later suffer premature death from serious illness.

Light Is The Most Indispensable Stimulus for the Nervous System.

Humans Cannot Thrive Without Light, just as Plants Without Light Cannot Thrive. Plants without Light have no green flowers, only pale colours.

Pale is also man who is in the darkness or even in twilight, even if he had the purest air in a room. Light and pleasure are, as they must always be together, if life is to remain constant. The Sun alone Is Light, which gives us what we need to live and thrive. With Light, the energy also descends to earth.

Light is to be regarded as the Source of Life, since Oxygen, called the joy of life, develops from plants under its influence.

The Energy, however, is a substance indispensable for Life, as only through it can the renewal, through which our life is sustained, come. It is Sunlight that provides Ozone, the substance that fills the lungs, that heals the miasmas in the lungs. This also explains why modern medicine treats the terrible pulmonary consumption not with medicines, but only with pleasure, and specially at the beginning of serious illnesses, Treatment is accompanied by the best results. It has long been known that Sunlight by its very presence accelerates the animal's development.

The great Pettenkofer of Munich established the fact that the amount of exhaled carbon dioxide increases in the light, and that it reaches its lowest point in the dark. Fattening is therefore better in the dark than in the sun; this type of fattening is to be rejected, because it leads to pathological fat formation.

Fundamental Functions, Require Long Light. It is a well-known fact that a person is a completely different person in Sunshine than in dull weather.

People speak nowadays of Electrical Treatment and praises it.

This Electrical Treatment can be best achieved through the Sun's Rays, in spring. In the Sunbeam, Larch (conifer trees of the Pinaceae family; products extracted from larch include arabinogalactan, rosin, turpentine), and Electricity are intimately Combined, hence their Wonderful Healing Power.

The human organism reacts particularly sensitively to light.

The light it is like the young striving for light and warmth.

A convalescent recovers his strength much faster if he is in a sunny room, where the sun can shine far faster than in a dark one. Hence, being in the North Hemisphere, the healthiest place is facing south. **A troubled mind is healed, strengthened, more quickly and reliably by a stay in sunny weather, by a trip to the glorious sunshine. Entire families travel to Nature Outdoors, and Forest Walks Are Refreshment for Body and Soul, and Return to Refreshed."** - in "Die Heilkraft des Lichtes", Die Presse, Oſtmärkiſche Tageszeitung, 4 April 1914.

The Power of Light in Healing

"Light acts as a chemical stimulus on the living cells that absorb it.

It is not the sense of sight that is sensitive to this light, but the living tissues themselves. These effective rays are primarily invisible, so it is now necessary to measure the invisible rays comparatively. Ultraviolet radiation has a scattering effect on negative electricity (Hallwachs effect). This is the basis of the zinc sphere photometer, and more recently, those with potassium-sodium cells instead of zinc spheres." - in "Prometheus : Illustrierte Wochenschrift über die Fortschritte in Gewerbe, Industrie und Wissenschaft", 11 November 1916.

Light As A Remedy

"Light As A Remedy. The microorganisms of typhus, anthrax, cholera, and the like, perish, as Spemann's "Mother Earth" emphasizes, even on the best nutrient medium when exposed to the sun's rays.

In direct sunlight, they usually dissolve into nothing after just a few hours, and under certain circumstances, even after minutes.

All relevant bacteriological experiments have also produced a consistent result: that the so-called chemical rays, i.e., the Blue, and Violet rays, primarily exert this Bactericidal Effect.

Émile Duclaux, who used pure cultures, established that only light, not heat, caused the destruction, for iodine flasks, which are continuously exposed to the highest temperatures in a dark incubator, still show viable cultures years later. **He concludes a treatise on this subject by stating that light is the most powerful, cheapest, and most widely used bactericidal agent at our disposal."** - in "Lodzer Tageblatt", 22 July 1899.

Colour As A Remedy

"Today, no prominent physician would deny that Colour Plays an Important Role in the Healing Process, and that its correct choice proves Particularly Useful in Nervous Disorders, and Mental Illnesses.

In the 1890's, Parisian physicians claimed that Blue Light had an exceptionally healing effect on Smallpox (Variola), and that the Healing Process left barely any scars on the skin. In China, for Epilepsy, the patient is placed on a Purple carpet, and the windows are covered with Purple veils.

For Intestinal Diseases, the patient's abdomen is smeared with Yellow paint, and daylight is drawn into the room through Yellow curtains.

This is evidence that the influence of Colour should have some significance in cases of illness among all peoples, and indeed, the more one delves into the subject, the less fantastical it appears. The door is opening ever wider to a clearer understanding of other Vibrations, other influences which may seem less comprehensible to us because they are of an Unseen Nature, but whose existence cannot be denied." - in "Die Farbe als Heilmitte", Amulette und Talismane und andere geheime Dinge, 1927.

> ***"Colour in Both its Physical, and its Spiritual Applications.***
> ***Colour as a Therapy is following Music Therapy, which is already an established help in medical treatment. Look out and search into that which man once knew of the metaphysical, and what man also used as energies to build his world in the past.***
> ***If we were totally conscious beings we could benefit from far better health."*** *- in "Healing Through Colour", 1983.*

Perception, Consciousness And Awareness of The Unseen

"If there are colours we cannot see, sound we cannot hear, and dense and solid bodies which we cannot discover by touch, it is certainly not too difficult to conceive of a world which though possessing sounds, colours and material objects, is yet imperceptible to us.

It would be as unknown to us, by direct perception, as a man is to an ant, or a bird to a beetle. And if any or beetle, or a fish in its element could be questioned and could make a reply, they would probably be deeply skeptical about the existence of men and birds - unseen and unseeable entities alleged to be living right along-side of them in the same world. This is, obviously a matter of what is called planes of consciousness or awareness, and not really in the "same" world at all. The ant world is the nest or hill; the fish world is a limited area of sea; and though it happens that man can peer in on both of them, they have no way of discovering him. At this point the fruitful principles of analogy suggest, that possibly there are invisible beings who can peer in on man also.

He may be the "crux" of creation (or cross of affliction of it) but is not necessarily its crown. And though reputed to be a little lower than the angles, this earth manifestation of him at least may be but little higher than a Caterpillar, in the eyes of unknown but observable Intelligences.

Of course, if you define sound as sensation, as audibility, then by definition there are no sounds you cannot hear. If you define colour as seeing, as visual perception, then by definition there are no colours you cannot see. But the physicist knows that colours are distinguished from each other by their wave lengths, and the length of the waves has been measured.

Red, has a wave length of .00007594; while Violet, at the other end of the visible spectrum, is .00003968. All the other colours come in between with decreasing values. But that does not mean the series or scale of colour is exhausted; the tabulation of wave lengths goes right along below the Red and above the Violet. It is only our ability to see them which runs out on us.

Using the word colour in this very correct and logical sense, it is plain that an object may have a colour which we cannot see, and will therefore be invisible to us." - in "The Ether Ship Mystery and Its Solution", 1950.

A Note on Ether (Aether) may be defined as the combination of a higher plane, leading to the realm of metaphysics, to where every consideration of the atom finally leads one. As are the positive and negative forces as relating to gravitation, they act upon the individual's Development, or individual's application of thought as applied To metaphysical condition or position as is occupied from within itself. Hence, as is seen, there are (as illustration for this) certain Characters of disease that accentuate mental forces, or the metaphysical activity of a human body.

Light, Colours, And Vibration

"We are pleased to note that our reflections on the secret powers of colour and light have inspired many readers.

Even a number of thoughtful physicians have expressed their appreciation for our studies and suggestions.

We now, forced by the force of the facts that were coming at us from all sides, transformed our society, which was engaged in modern light and colour research in the narrower sense, into one for high-frequency and light research, since we are increasingly recognizing the interplay of light, colour, and electricity and, for the sake of humanity's well-being, wish to combine and utilize these forces more and more practically.

An eminent physician, Medical Officer Dr E. H., writes:

"I have long been convinced that electricity is our Alpha and Omega."

I have been using colour therapy for some time, using simple blue discs through which I shine sunlight or spirit light.

Then I use red through!

I use of red curtains for measles and chickenpox.

I have also had the Goldscheider mirror for 2 years, in which I put red, blue, and green.

By incorporating high-frequency therapy, quite astonishing cures arise.

We bring a nervous patient to life through coloured lighting, into a calmer mood and allow the high-frequency currents to work on him, bringing balance to the inner workings of the body.

Eliminating tensions, shifting forces back and forth.

But even the solitary application of high frequency quickly helps in many cases.

A strong, young man, who suffers from neuropathy and often overindulges in the stimulants of tobacco and alcohol, suffers from frequent heart pain and irregular heart function.

The use of high-frequency current helps him every time.

He places the electrode on the heart area and is free of symptoms within 10-15 minutes.

I personally try this remedy when my heart is a little tired, and after a few minutes, I feel an indescribable sense of well-being.

One can literally feel the Blood Flowing down to my feet, which were previously cold.

Researchers in the field of innermost vital processes, who observe the endocrine gland connections, have highly interesting experiences when practising this Therapy. In this way, mysterious connections between the abdominal organs and the brain can be uncovered.

Through special application of the electrodes in the genital area, I Refreshed an Overtired Brain.

In a Goiter that developed during menopause in women, rapid regression occurred when the Electrode was placed on the Ovaries." - Prof Carl Wilhelm Ewald Paul, Director of the Munich Society for Light and Colour Research, in "Light, Colours, and High Frequency", Zentralblatt für Okkultismus, August 1923.

Colour Effects in Hospital Rooms

"Our experts, including many doctors, have long been conducting experiments with colours in hospital rooms and have convinced themselves of the health benefits of correct colour combinations.

We also mentioned this fact in our previous reports to this professional journal and today we would like to present some further observations that are certainly likely to attract general attention.

We first note that the sick and those in need of recovery have a veritable hunger for certain colours.

Indeed, it is mostly spring colours, the fresh, cheerful tones, that are desired.

Those recovering from Typhoid, for example, crave light green and seem to gather new strength in this colour.

The Entire Range of Spring Colours Is Beneficial to Weak, Suffering children.

In cases of Rickets, They Recover Quickly in rooms maintained in this way, with simultaneous exposure to the darkest Violet Under Appropriate Glass Panes in a sunbath.

The invisible Ultra-violet Rays in the Mercury Quartz Light also work wonders on them. It seems that this colour contains the substance or force that their bodies lacked.

We have demonstrated in many experiments that the mentally ill can greatly benefit from the correct distribution of colours in their rooms.

The observations of the effects of colour in hospital rooms recently submitted by our Austrian expert, Ing. F. E. Schillinger, are quite astonishing.

He writes:

> *"I had to enlist and in 1918, suffering from severe influenza, I was taken to the Rainer's Hospital in Vienna. Our room, which was painted pink to the Southwest, had white beds, etc., and was occupied by 11 patients, 3 of whom died. During the disinfection of the room, 9 of us were quartered in a room, in which 6 soon died.*
>
> *And this room, also facing Southwest, was painted blue-gray.*
>
> *The weather was, however, also very bad and we all felt very depressed.*
>
> *We were then taken to another room; the rainy weather continued, the location was facing south and Southwest, the walls were painted a so-called "rich" Yellow (cadmium dark). The ceiling stripes were Orange, the ceiling itself very light Blue.*
>
> *Even today, I fondly remember the hours spent in this room, for we laughed and joked here from morning until night. None of our staff of 7 men died, and it was in this room that we all first received that symptomatic "Nosebleeds", which seem to initiate the so-called healing crisis of this disease. I still have drawings of those rooms, made out of boredom, in pencil, with colour notes. I emphasize this so that you don't think your comments have led me to affirmative statements. Regarding your observation that violet is beneficial for people with nervous disorders, I would like to add: When I was wounded in 1917, shortly after having fallen in an avalanche, and suffered a nervous shock, I became quite nervous. It was then, as I was rummaging through my front sketches, that a memory of "Night Mood of the Karst" particularly attracted me, so much so that I made a small colour picture based on it. It was composed in the following colours: Parisian Blue, Naples Yellow (bluish) for the highlights, dark red, violet from Par. Blue and Carmine; thus, the basic tone: violet.*
>
> *As nervous as I was, I was able to demonstrate incredible patience in this activity.*
>
> *The benefits were mutual. Since I liked working in so-called colour schemes (blue-*

> ***gray, also yellow-brown, yellow-gray), I found in your explanations the explanation for many things that had remained incomprehensible to me until today. For example, a picture in a golden-brown shade comes twice as fast to me as one in blue-gray."***

And we could present hundreds of such examples and reports.

Seeing is a very complicated process, the uncovering of which the human mind has long struggled to understand. But the view of our great ophthalmologist and light researcher Dr Fritz Schanz, that light affects the eye no differently than it does in nature and that

Different lights correspond to different excitations in the optic nerve, points us in the right direction. And just then, another capable researcher in the field of light and color perception, Dr F.W. Fröhlich, enters the picture.

Based on his investigations into electrical phenomena in the cephalopod eye, he arrives at further interesting conclusions.

The form and frequency of the electrical current fluctuations occurring in the eye upon exposure to light are his fundamental structure.

The retina is responsible for generating these current fluctuations in a particular way, and when they reach the center, we evaluate them as specific lights or colours. Every Light of a Certain Intensity Corresponds to a Certain Frequency of Stimulation in the eye, and thus every Light Generates Currents of a Different Frequency of Oscillation.

These oscillations, and only these, are transmitted to the center: red produces currents of the lowest oscillation frequency, violet those of the highest frequency. The energy of the oscillations also varies; for the same stimulus intensity, the electromotive force is much greater for violet light than for green, and in turn, more significant than for red.

Added to this is the varying absorption capacity of the retina.

Thus, we have three things that interact: the frequency of the oscillations, the energy value, and the absorption.

These are the characteristics of each light.

The tone of the visual center is either increased or inhibited by the stimuli.

For this researcher, the essence of colour perception lies in the particular response of the light-sensitive elements in the retina to the light stimuli and in the response of the center to the oscillatory stimuli of varying frequency and intensity sent to them.

Accordingly, the differentiation of light stimuli in the retina and color perception depend on the extent to which the retinal elements are able to differentiate the light stimuli and convert them into specific electrical current fluctuations.

The ability to emit different typical current fluctuations in response to different lights is the decisive factor." - Prof Ewald Paul, Director of the Munich Society for High Frequency and Light Research, in "Colour Effects in Hospital Rooms", Zentralblatt für Okkultismus, April 1924.

Colour Therapy

"The ancient peoples have many mysterious things to tell us about the powers of colours; the Chinese placed a special spirit in each of them.

Peoples taught that yellow had excretory powers, that it aroused and expelled. Modern therapy confirms this. Sunlight directed through yellow glass onto a sluggish abdomen quickly causes deviation.

The Colour Therapist Körner explained in the relevant session that yellow paper and yellow-painting of the abdomen also produced similar effects.

The ancients used chains of red and blue glass beads to treat goiters and other cold sores.

We know that red light loosens the goiter and blue light influences it chemically. If only red light is used, the goiter initially enlarges, then softens, loosens, and becomes more vibrant through increased blood flow.

However, one must then ensure that the fluids are diverted downwards.

Green heals wounds.

Wörner says:

> ***"If you apply green (naturally non-toxic) paper, you can practically see the growth. Even with green glass, you experience miracles."***

The colours that are pleasing to the eye are not always beneficial to the body.

One must observe and find a good middle ground.

For example, For example, blue is harmful for scrofula, varicose veins, etc.

Ancient peoples also knew this, which is why they wore copper bracelets around their wrists and ankles. With Ruby glass, through which we pass light, we can now beneficially influence various processes in the abdomen.

Even coloured glass bowls can work wonders.

Our artistic advisor, Carl Koch, a highly educated man who currently worked in Paris with the famous physician Prof. Tissier, explains that he used one of the simplest instruments, the well-known kaleidoscope, with nervous children suffering from insomnia, which always brought rapid success.

The children had to observe the play of colours and the emerging shapes, were distracted, and fell asleep.

Our expert Michaelis, who has been conducting serious scientific studies in the field of colour for over 20 years, is particularly concerned with the colours of the months, the colours of the mood under which the individual is influenced since birth. And he cannot help but acknowledge the truth of many of the ancients statements. All his calculations always return to the same point.

For those born in January, ultra-red is considered the dominant colour.

Ultraviolet for the February people, green for March, blue for April and May, red for June, orange for July, indigo for August and September, yellow for October, violet for November, and white for December.

We still face many puzzles, but science already recognizes that profound knowledge is hidden in the traditions of the ancients." - Prof Ewald Paul, Director of the Munich Society for Light and Colour Research, in "Colour Mysticism and Colour Therapy", Zentralblatt für Okkultismus, July 1922.

> ***"For it is Nature that Cures: Not the Physician or Nurse. Light; Second only to Air, Is Light as an essential for growth, health, and recovery from sickness (not only daylight, but Sunlight), and indeed Fresh Air must be Sun-warmed, Sun-penetrated Air. This should be meant to include Colour, pleasant and Pretty sights for the patient's eyes to rest on; variety of Objects, Flowers, Pictures. People say the effect is on the mind. So it is, but the enlightened physician tells us it is on the body too. The sun is a sculptor as well as a painter."*** *- Florence Nightingale, in "A Dictionary of Medicine; including General Pathology, General Therapeutics, Hygiene", 1894.*

The Usefulness of Colour & Vibration Therapy

"Case 1. Janet Whittenberg son suffers from; Cerebral Palsy.
Case 2. Betty Drury son is; Mentally Retarded.
Case 3. Virginia Beach woman has a son whose; Brain is Severely Damaged.

The 3 mothers have a common bond in that Medical Trade Doctors, have told them their sons are beyond medical help. And they have a further bond.

They all take their sons to Dr Charles F. Whitehouse, DC, a Chiropractor, for Treatment with Coloured Lights, and Psychic Vibrations.

He uses Radionics, which he calls Etheronics, and Colour Therapy.

Mrs Whittenberg, of Norfolk, says she has obtained results from Dr Whitehouse, DC.

Her 3 year old son, has been getting better since she started taking him for treatment.

> ***"I had gone to so many Medical Trade Doctors, and Hospitals. He was a vegetable. He did not do anything. They said his brain was deteriorating, and there was nothing they could do. They considered him a terminal case."***

On the advice of a neighbour, she took her son to Dr Whitehouse, DC.

"I saw results within a month. He had only 2 teeth in his mouth, and in 1 month every tooth had come in. He had stopped growing and he started growing again. He was all yellow but that faded away. Now he is very alert, knows everyone in the family and watches TV. I am very pleased."

Mrs Drury, of Newport News, said she has seen:

> ***"Tremendous Improvement in my 15 year old son, since I began taking him to Dr Whitehouse, DC. He remembers better, keeps up school work better, writes better, recognizes more words, and his features are changing. Before we took him to Dr Whitehouse, DC, he was very hyperactive, he tore up everything and he couldn't even tie his shoes. After 1 month of treatment, he suddenly sat down and tied his shoes. And he hasn't torn up anything since. Everyone in the family notices the difference."***

Mrs Drury said Medical Trade Doctors told her that son was uneducable and untrainable. But, she said, he is learning more all the time.

> ***"His speech therapist at school is amazed at the difference. He has started making 100's on every one of his tests."***

The Virginia Beach mother said she has been taking her 6 year old son to Dr Whitehouse, DC, since February.

> ***"There's been a lot of progress. It's a very strange coincidence if it isn't due to Dr Whitehouse, DC. I'm encouraged by what I see. I'm very pleased."***

She has continued to take her son to Dr Whitehouse, DC, because her son has slowly but steadily been improving. And Medical Trade Doctors, had told her there was nothing they could do. She said her son has suffered from brain damage since birth, and could do little more than roll over before Dr Whitehouse, DC treatment.

> ***"He has since become aware of his surroundings, he scoots all over the place, he is starting to relate to people, and he is developing a temper. He still can't walk, or talk but he can do a lot of vocalizing with sounds."***

Dr Whitehouse, DC, specializes in the Treatment of the Mentally Retarded.

But he also treats persons with Cancer, Heart Problems, and other illnesses.

He treats them by shining Coloured Lights on them, and bombarding them with Psychic Vibrations.

A complete treatment of body, soul and mind takes about 300 hours.

Treatment is available without charge for the mentally retarded through the Etheronics Research Foundation. Dr Whitehouse, DC, claims a basis for support of Colour Therapy in work being done at the University of Minnesota. Dr Douglas Pratt of the university's biology department said he is researching the effect of coloured lights on plants. He said he has found that very deep reds and very deep blues; have an effect on the growth of plants.

Dr William Tiller, chairman of the Department of Material Science at Stanford University. Spent 1 year investigating the work of George de la Warr, a Radionics Researcher in Oxford, England.

> ***"My experience is that it is very effective in the hands of the right person. Radionics is an intuition training device. Basically, the human being is the instrument, and the device helps the individual to attune. The operator is the key, not the device."***

Dr Tiller, believes there is promise in Colour Therapy.

> ***"There is Soviet work going on right at the moment in which they are shining laser beams at acupuncture points and, depending on the wavelength or set of wavelengths that they use, they are indeed producing healing modalities.***
> ***They're getting rather strong effects of recuperation in people for a whole variety of conditions but it depends very much upon the colours, and colour combinations they use. And in this particular case, it's laser light. Both fields deserve scientific research. My own feeling is that it's tomorrow's Physics."***

Radionics was developed in the early 1900s by Dr Albert Abrams, MD.

His theory was that diseases could be diagnosed by evaluating radiation from the human body. He devised a machine, the Oscilloclast, to measure the radiation. Colour Therapy is based upon the aura, which is an Electromagenetic Field (EMF), which appears to extend about 3 feet around the human body.

People can be trained to see the multi-colored auras.

Some say they can diagnose diseases by interpreting the intensities of the different colours and the distances they extend from the body.

Dr Whitehouse, DC, says the aura is an electronic duplicate of the physical body. He calls it the etheric body.

He has developed a machine, based on radionic principles, which he calls an etheronic analyzer. He says he can measure changes in the concentration of energies in the aura. And, he says, he can measure the strength of the energy coming from any specific part of the body.

He believes that every part of the normally working body radiates a specific level of energy.

If all energies are at their normal levels, an individual's etheric body is in balance. But if the energy levels are either too high or too low, the body is out of balance or in disharmony.

And disharmony in the etheric body, he says, can result in disease in the physical body.

Nothing happens in the physical body, he believes, unless it first happens in the etheric body.

Dr Whitehouse, DC believes that by bringing the etheric body, the aura, back into balance, he can treat a physical disease.

The aura can be brought back into balance by shining specific combinations of coloured light on it.

Different combinations are used to treat different problems.

To find out what particular energy levels are normal for a person, Dr Whitehouse, DC, uses his Etheronic Analyzer to help him psychically tune himself to that person's mind.

He asks the mind what the normal energy levels should be for each part of the body he wants to check.

The answer comes in a numerical readout on the analyzer.

Dr Whitehouse, DC, then concentrates on the specific parts of the body and gets a readout on what the energy level actually is.

To contact a person's mind, Dr Whitehouse, DC, first needs a Polaroid picture of the person. The picture, captures the vibrations from that person's body.

He places the picture in a coil in the analyzer, which, he says, helps amplify the vibrations and allows him to tune into the person's mind.

To get a readout, he rubs one hand on a sensitive plate of the analyzer and starts moving dials on the instrument with the other hand.

Each dial is circled by numbers.

His hand rubbing on the plate makes a squeaking sound which increases or decreases in intensity as he moves the dials.

When the sound stops altogether, each dial is pointing to a number.

The series of numbers is the readout.

The person whom Whitehouse is contacting may be in the next room, or may be miles away.

> *"With the mind, there is no distance".*

The key to success is the psychic ability of the operator.

> *"The instrument is an extension of the operator's mind. It permits you to use your mind to a greater degree than before."*

Using the readout, Dr Whitehouse, DC, determines what combinations of Coloured Lights are needed to treat a person.

If the person is in his office, the treatment is given by actually shining the lights on him. But the patient doesn't have to be there.

Each Colour of Light, Vibrates at a Different Frequency.

So in place of using lights to treat someone, he can use vibrations.

This is done by setting the dials on the analyzer, to the numbers which correspond to the vibrations to be used.

The picture of the person to be treated is placed in the coil.

The vibrations start in the operator's mind, and are picked up by the analyzer and transmitted to the patient.

> ***"The machine is a focal point for the operator's sensitivities. You tune your mind, and your energy penetrates its energy field. The instrument operates as your mind operates. And it keeps doing the vibration pattern even after you walk away from it."***

The vibrations reach the patient's etheric body, and "Energize it to start vibrating and do what it should be doing."

Before treating a person for any specific illness, Dr Whitehouse, DC, first cleans out the person's aura. This is necessary, because the aura may have ruptures or leaks. Ruptures can occur from such experiences as being administered anesthesia, having an accident, suffering emotional shock or high fever, smoking marijuana or taking hallucinogenic drugs.

Ruptures also can be caused by acute drunkenness.

About 7 of every 10 persons have leaks in their auras.

When a leak occurs a discarnate entity may attach to the person through the ruptured aura. If there are several leaks, a person may have several entities attached to his body. And each entity places a drain on the body.

With certain combinations of coloured lights or vibrations, Dr Whitehouse, forces the entities out of the body and seals the leaks in the aura so they can't get back in. In the experience of Dr George Ritchie, psychiatrist, has described an out-of-body experience.

He saw entities attaching themselves to people through openings in their Auras." - in "Beach Chiropractor Prescribes Colors, Psychic Vibrations", The Beacon, Virginia Beach, Va., 18 October 1979.

Green Light Therapy

"We investigated the Effects of Light on Human Fibroblasts in vitro by measuring protein levels of cytokines secreted by fibroblasts during the process of wound healing and on the migration of HaCat keratinocytes (spontaneously immortalized keratinocyte cell line derived from adult human skin).

The results suggest that some cytokines are significantly increased by exposure to Light, especially leptin, Interleukin-8, and Vascular Endothelial Growth Factor A, but only by Green Light.

The migration of HaCat keratinocytes was significantly promoted by Red or Green Light.

In Conclusion; We Demonstrate that Green Light Promote Wound Healing by inducing migratory and proliferative mediators, which suggests that Not Only Red Light, But Also Green Light can be a New Powerful Therapeutic strategy for Wound Healing." - in "**Green Light emitting diodes Accelerate Wound Healing", Wound Repair and Regeneration**, 1 March 2012.

> ***"Green Light provides an Anti-Inflammatory Effect on Skin Burns."*** *- in "Green LED light has anti-inflammatory effects on burns in rats", Burns, March 2016.*

> ***"Green Light exposure reduced the number of monthly Headache days by an average of about 60%.*** *None of the study participants reported any side effects of Green Light exposure." - in* ***'The Healing Power of Green'****, University of Arizona, Winter 2020.*

Green Light Therapy Improves Multiple Conditions

"Light Therapy Improves Multiple Conditions such as; Seasonal Affective Disorders, Circadian Rhythm Dysregulations, and Neurodegenerative Diseases.

Green Light Therapy has been shown to be effective in Reducing Chronic Pain; in humans and animals. Moreover, this Therapy potentiated the antinociceptive effects (acting as a pain inhibitor). We showed that Green Light increases endogenous opioid levels while lessening synaptic plasticity and neuro-inflammation. Clinical translation of these results could provide patients with improved pain control and decrease opioid consumption.

Given the noninvasive nature of Green Light, this innovative Therapy would be readily implementable in hospitals." - in "Green Light Exposure Elicits Anti-inflammation, Endogenous Opioid Release and Dampens Synaptic Potentiation to Relieve Post-surgical Pain", The Journal of Pain", March 2023.

The Difference Between Red and Infrared Light

The main difference is that Red Light has a shorter wavelength, is visible to the human eye, and penetrates the top layers of the skin, while Infrared Light has longer wavelengths, is invisible, and can penetrate much deeper into tissues and muscles. Red Light is ideal for Skin Conditions, in the superficial tissue, whereas Near-Infrared (NIR) light is better for pain relief, wound healing, and deeper tissue issues.

The Influence of Light and Colour Upon the Lymphatic System

Light, especially Red, and Near-Infrared (NIR) Light Therapy, positively influences the Lymphatic System by Reducing Inflammation, and Stimulating Lymph vessel contraction, which Improves Lymph Drainage, and Reduces Swelling. Colour Therapy and ambient lighting, such as Blues and Greens, also support the Lymphatic System by promoting relaxation and reducing stress, creating a conducive environment for Lymph Drainage, and overall wellness.

The Effect of Near-Infrared Light on Nerve Regeneration

"Red to Near-Infrared Light have been shown to promote mitochondrial **oxidative metabolism. In this study, Near-Infrared Light irradiation improved nerve regeneration and increased antioxidation levels in the chamber fluid.**

Therefore, we propose that antioxidation induced by Near-Infrared Light may be conducive to Nerve Regeneration." - in "Effect of near-infrared light-emitting diodes on nerve regeneration", Journal of Orthopaedic Science, March 2010.

Infrared Neural Sensory Stimulation

"It has been demonstrated in recent years that pulsed, Infrared laser Light can be used to elicit electrical responses in Neural Tissue, independent of any further modification of the target tissue.

Infrared Neural Stimulation has been reported in a variety of Peripheral, and Sensory Neural tissue in vivo, with particular interest shown in Stimulation of Neurons in the Auditory Nerve.

Electrical Stimulation remains the gold standard in Neural Excitation." - in "Whole Cell Patch Clamp for Investigating the Mechanisms of Infrared Neural Stimulation", Journal of Visualized Experiments, 31 July 2013.

Red to Infrared Light Therapy

"Red to Infrared Light Therapy (λ = 600–1070 nm), and in particular Light in the Near Infrared range, is emerging as a Safe and Effective Therapy That Is Capable of arresting Neuronal Death.

Near Infrared range Therapy has the potential to develop into a safe and effective Neuroprotective Treatment for patients with Alzheimer's, and Parkinson's Disease (and presumably Other Neurodegenerative Diseases; such Multiple Sclerosis, and Amyotrophic Lateral Sclerosis).

If Near Infrared range was applied at early stages of the disease process, for example at first diagnosis, it could potentially slow further progression by Protecting Neurons From Death.

The Therapeutic possibilities are many and the potential outcomes very exciting." - in "Turning On Lights to Stop Neurodegeneration: The Potential of Near Infrared Light Therapy in Alzheimer's and Parkinson's Disease", Front. Neurosci., January 2016.

Neural Stimulation, Wound Healing, Cancer Treatment

"Infrared Radiation is Electromagnetic Radiation with wavelengths between 760 nm and 100,000 nm. Low-level Light Therapy, or Photobiomodulation Therapy generally employs light at red and near-infrared wavelengths (600–100 nm) to modulate biological activity. Many factors, conditions, and parameters influence the Therapeutic Effects of Infrared Radiation, including fluence, irradiance, treatment timing and repetition, pulsing, and wavelength.

Infrared Radiation Can Inhibit Cancer Cell Proliferation

Increasing evidence suggests that Infrared Radiation can carry out Photostimulation and Photobiomodulation effects particularly benefiting:

1. Neural Stimulation.
2. Wound Healing.
3. Cancer Treatment.

Nerve Cells Respond Particularly Well to Infrared Radiation.
Infrared Radiation appears to be more versatile than other electromagnetic wavelengths (such as visible light), as It Can Induce Neural Stimulation Effects, as Well as Promoting a Wide Range of Therapeutic Benefits in Cells or Tissues.

Brain Neuroprotection and Neurodegenerative Disorders

In this Review, we have Summarized the up-to-date literature Reports about Uses of Infrared Radiation, including:

1. Neural Stimulation (direct activation of neural tissue by Infrared Radiation);

2. Photoaging (emerging evidence that Infrared Radiation can have biphasic effects on the skin);

3. Antitumor Action (Infrared Radiation Can Inhibit Cancer Cell Proliferation);

4. Brain Neuroprotection (novel neuroprotective treatments for stroke, Traumatic Brain Injury);

5. Neurodegenerative Disorders (Infrared Radiation therapy for Alzheimer's and Parkinson's Diseases)." - in "Biological effects and medical applications of Infrared Radiation", "J. Photochemistry and Photobiology B: Biology", May 2017.

Anti-Inflammatory Effects of Near-Infrared Light

> ***"Near-Infrared can penetrate the dermis.***
> ***Near-Infrared is able to regulate cutaneous component cells, and immune cells and shows Significant Anti-Inflammatory Therapeutic Effects."*** *- in "Anti-Inflammatory Effects Induced by Near-Infrared Light Irradiation through M2 Macrophage Polarization", Journal of Investigative Dermatology, August 2021.*

Infrared Neural Stimulation of Brain, and Central Nervous System

"Modulation of Brain Circuits by Electrical Stimulation has led to exciting and Powerful Therapies for Diseases such as Parkinson's.

Because Human Brain organization is based in mesoscale (millimeter-scale) functional nodes, having a method that can selectively target such nodes could enable more precise, functionally specific stimulation therapies.

Infrared Neural Stimulation, Stimulates Neural Tissue via delivery of tiny heat pulses. This method provides focal intensity-dependent stimulation of the brain without tissue damage. **We demonstrated that Infrared Neural Stimulation Modulates Neural Activity in the cortex (as assessed with intrinsic signal optical imaging), and likely activates local intra-areal networks in layers II/III.**

This is the first study demonstrating application of Infrared Neural Stimulation to human Central Nervous System, and shows feasibility for stimulating single cortical nodes and associated sites and provided Infrared Neural Stimulation damage threshold estimates for cortical tissue.

Our results suggest that Infrared Neural Stimulation is a promising tool for stimulation of functionally selective mesoscale circuits in the human brain." - in "**Infrared Neural Stimulation in Human Cerebral Cortex**", Brain Stimulation, March 2023.

Near-Infrared Light Halts Cancer Growth

"Photobiomodulation therapy traditionally utilises red to infrared light (600–1000 nm) to promote wound healing, reduce inflammation and manage pain and age-related symptoms. Photobiomodulation therapy has become increasingly popular due to its non-invasiveness and the ability of red to Near-Infrared light to reach deeper into human tissue (650 and 750 nm, respectively) compared to other wavelengths of light. **Photobiomodulation, utilising non-ionising light in the visible and Near-Infrared spectrum, has been suggested as a potential method for enhancing tissue repair, reducing inflammation and possibly mitigating cancer-therapy-associated side effects.** Near-Infrared light is suggested to be absorbed intracellularly, mainly by chromophores within the mitochondria.

This study examines the impact of 734 nm Near-Infrared light on cellular senescence. Exposure to Near-Infrared light significantly increases senescence levels in cancer (10.0%–203.2%) but not in non-cancer cells ($p > 0.05$). **Changes in senescence were associated with significant modulation of mitochondrial homeostasis, including increased levels of reactive oxygen species ($p < 0.05$) and mitochondrial membrane potential ($p < 0.05$) post-Near-Infrared-light treatment. These results suggest that Near-Infrared light modulates cellular chemistry, arresting the proliferation of cancer cells via senescence induction while sparing non-cancer cells.**

Near-Infrared-Light Characterisation

LED Near-Infrared Light exposure was achieved by using a pre-mounted 7—LED array of NIR (734 nm) Rebel LEDs (Luxeon Star LED, Alberta, Canada) mounted on a SinkPAD-II 40 mm Round 7-Up base with a power output of between 0.328 and 0.420 mW (fluence = 63 mJ/cm2, power density = 0.05 mW/cm2), as described in ["Therapeutic application of light and electromagnetic fields to reduce hyper-inflammation triggered", Communicative & Integrative Biology January 2021]. The current study demonstrates that **Near-Infrared light inhibits proliferation in cancer cells but not in non-cancer cell. The proposed general mechanism, partially detailed in the literature of Photobiomodulation Action, Appears to Involve an Increase of Reactive Oxygen Species (oxygen-containing molecules that easily react with other components within a cell) production, which our data seem to confirm, and thus, could be operative in this senescence mode. This Mechanism Takes Into Consideration The Warburg Effect, where Cancer Cells Have A Greater Shift Towards Glycolysis (Glycolysis is the foundational metabolic pathway that breaks down glucose ($C_6H_{12}O_6$) into two molecules of pyruvate, generating energy in the form of Adenosine Triphosphate (ATP the primary energy currency of biological cells), and Nicotinamide Adenine Dinucleotide (NADH a coenzyme central to metabolism, found in all living cells. Nicotinamide Adenine Dinucleotide + Hydrogen, is the biologically active, reduced coenzyme form of vitamin B3 [niacin], found naturally in all living cells, it plays a fundamental role in cellular respiration, where it acts as an electron donor to generate energy Adenosine Triphosphate (ATP). Occurring in the cell's cytoplasm, it is the first stage of both aerobic and anaerobic respiration and functions without requiring oxygen), Leading to Increased Reactive Oxygen Species levels. The combination of the already elevated Reactive Oxygen Species levels in cancer cells and Photobiomodulation-induced Reactive Oxygen Species increase activates a signal cascade towards senescence and permanent cell cycle arrest as a stress response. This mitochondrial/Reactive Oxygen Species-based mechanism would support the well-described anti-inflammatory and wound-healing properties observed with Photobiomodulation."** - in "Selective induction of senescence in cancer cells through near-infrared light treatment via mitochondrial modulation", 21 June 2024.

The Effects of Infrared Light Therapy in the Treatment of Inflammation

"The beneficial effects of Red and Infrared Light in the treatment of inflammation have been well known since the time of Niels Finsen, who received the Nobel Prize in 1903 for his demonstration that a human autoimmune disease, lupus vulgaris, could be successfully treated and cured by application of visible light. In subsequent years, illumination of patients with red or infrared light, known as Photobiomodulation therapy (PBM), was proven clinically effective against a variety of human diseases including:

1. Achilles tendinopathy.
2. Alopecia Areata.
3. Psoriasis.
4. Thyroiditis.
5. Arthritis.

A unifying feature of all of these conditions is that they involve excessive inflammation.

The wavelength range used for Photobiomodulation therapy currently spans the infrared and red-light spectral regions. Exposure to these wavelengths is not known to generate any harmful side effects and infrared light, in particular, is the wavelength which best penetrates body tissue. Exposure devices are commercially available in a large range of intensities and wavelengths; they are fitted with laser or high-output LEDs as optical sources and exposure duration can be adjusted.

Pulsed Electromagnetic Field Therapy and Inflammation

Exposure to externally applied electromagnetic fields, known as Pulsed Electromagnetic Field therapy has likewise been shown to have anti-inflammatory properties in a range of diseases. Pulsed Electromagnetic Field therapy involves the external application of low intensity pulsed magnetic fields from 10 to approximately 300 Hz in frequency and around 10 mTesla maximum magnetic field strength. Unlike light, Pulsed Electromagnetic Field signals can penetrate the human body efficiently to reach internal organs, e.g., bronchi and lungs. Clinical studies have shown the effectiveness of Pulsed Electromagnetic Field in treating such conditions as arthritis, chronic pain, bone injury, wound healing, and lupus erythematosus; all of these Pulsed Electromagnetic Field treatments involve the resolution of underlying inflammatory conditions. A more direct analysis of Pulsed Electromagnetic Field therapy on the progress of inflammation has been obtained from recent molecular studies using different mammalian cell culture models in vitro. Pulsed Electromagnetic Field exposure was found to induce marked decrease in pro-inflammatory cellular markers including cytokines, gene expression, and activation of NFkB which characterize both the acute and the chronic phases of inflammation. Some changes occurred rapidly within hours after Pulsed Electromagnetic Field exposure, consistent with a direct effect on the cellular immune response. Intriguingly, many of these clinical applications of Pulsed Electromagnetic Field (electromagnetic) therapy seem to overlap with those of Photobiomodulation (illumination) therapy, in particular, those involving the resolution of inflammatory conditions.

Low-Level Magnetic Field Exposure Conditions

Two types of electromagnetic fields, Low-Level static magnetic field (LLF) and pulsed electromagnetic fields (PEMF) were used as treatment conditions.

In sum, our results have shown that both light (Photobiomodulation therapy) and electromagnetic fields (either Static or Pulsed Electromagnetic Fields) can be effective in reducing inflammation related to the Toll-like receptor 4 (a fundamental transmembrane protein of the innate immune system that acts as an early warning sensor. It primarily recognizes lipopolysaccharide; a major component of the outer membrane of Gram-negative bacteria; as well as damage-associated molecular patterns released during tissue) – dependent signaling pathway in human cell cultures. Their efficacy ranges from 20% (electromagnetic fields) to 40% (Infrared) reduction in inflammatory markers over a 48-hour period.

Our experiments with InfraRed irradiation and Electromagnetic field exposure have resulted in significant reduction of inflammation in human cell cultures. The necessary instruments, particularly in the case of infrared light, are readily available at low cost with no toxic side effects." - in "Therapeutic application of light and electromagnetic fields to reduce hyper-inflammation triggered", Communicative & Integrative Biology January 2021

The Action of Blue Light

"Phototherapy Is An Important Method of Dermatological Treatments.

Ultraviolet (280–400 nm) Therapy Is of Great Importance.

The Main Factors Responsible for Biological Changes Induced by Blue Light are Light Parameters. The Role, and the Mechanism of Action of Blue Light (400–500 nm), a UV-free method.

The Main Factors involved in the response of cells to Blue Light are Nitric Oxide (NO), and Reactive Oxygen Species (ROS).

It was demonstrated that Blue Light Induces an Anti-Inflammatory, and Anti-Proliferative Effect; thus, it may be beneficial for Chronic Inflammatory Skin Diseases such as:

1. **Atopic Dermatitis.**
2. **Eczema.**
3. **Psoriasis.**

Additionally, the Positive Effect on the Treatment of Acne Vulgaris, and on Hair Growth was also shown. Another beneficial effect is the Reduction of Itching, observed in some studies, which may be of Great Importance in the Treatment of patients with Skin Diseases. It seems that this method is safe, and the only observed clinical adverse effect may be transient hyperpigmentation." - in "Blue Light in Dermatology", Life (Basel), 8 July 2021.

> ***"It was announced in England about the beginning of this century, that the: Red Ray of Light was Heating; the Yellow Ray was Illuminating; the Blue Ray in a remarkable degree Stimulated the Development of Vegetable Life. Whoever has noticed the colour of the electric spark in atmospheric air, from an electrical machine, will readily recognize its likeness of colour to the blue colour of the sky. If experiments should be instituted to ascertain the electrical condition of the sky, as associated with its Blue Colour, and they should satisfactorily establish the connection, the result would prove to be one of the greatest blessings ever conferred upon mankind. What strength of vitality could be infused into the feeble young, the mature invalid, and the decrepit octogenarian! How rapidly might the various races of our domestic animals be multiplied, and how much might their individual proportions be enlarged!"*** *- in "The Influence of the Blue Ray of Sunlight", 1876.*

The Effects of Light in Colour Therapy

The Effects of Light in Colour Therapy:

1. Light relieves pain without the side effects of Narcotics; induces the organs to resume their work, and increases the oxidation.
2. Has a valuable nourishing effect on cellular tissue.
3. Increases the number and quality of red blood cells.
4. Promotes Metabolism.
5. Promotes Leukocytes (Light promotes certain leukocytes, such as T cells - or T lymphocytes, which are a crucial type of white blood cell in the immune system, that develop in the thymus and protect the body from infection and cancer, there are 2 main types: helper T cells, and cytotoxic T cells -, by increasing their motility and enhancing immune responses. Blue and Ultra Violet Light, in particular, can increase T-cell movement to sites of infection, while other forms of light, like Red and Near-Infrared, are used in photo-bio-modulation to influence Cytokine production - small proteins that act as messengers in the body, particularly within the immune system, to regulate immune responses and inflammation -, and other immune cell functions, including that of monocytes and neutrophils)
6. Stimulates the cells to eliminate waste products.
7. Regulates circulation (dilatation of blood vessels).

8. Relieves Inflammations.
9. Destroys Bacteria
10. Useful in Skin Diseases.
11. Destroys Pus Germs; Bacteria live on the skin (Bacteria like Staphylococcus Aureus, and Streptococcus Pyogenes, and Methicillin-Resistant Staph Aureus (MRSA), are the most common Bacteria that cause Abscesses).

Colours Have an Effect on Both: Body and Mind.

Colours Have Different Tributes:

Blue Colour

The Clinical Work by the Munich Society for Light and Colour Research, in the 1920's, show the usefulness of Blue Light in;

1. Calms
2. Relieves Pain and Soothes.
3. Acts against Nervous Excitation.
4. Rheumatism.
5. Insomnia.
6. Diarrhoea.
7. Violent bleeding from the lungs; Treated with 1 hour of Blue Sunlight.
8. Against Brain Inflammation, and Head Neuralgia.
9. Blue Light helps, animals get fatter.
10. Calves grow faster.
11. Nervous horses: The nervous system of horses can be improved with blue barn windows. Battery horses at the front get stables painted blue. Horses rest better, eat more, have fewer pests in the stable.
12. Ants, wasps, and other insects are deterred by blue light.
13. Plants grow and develop better; under blue light.
14. Blue was found useful in Thrombosis, and Severe Period Pains (Dysmenorrhoea,).
15. Blue was also used in prisons, to calm the inmates.

Red Colour

1. Activates, Impels.
2. Has a promoting effect upon the blood flow, into any affected tissue or organs, allowing for even more immune and defence substances, to circulate through the blood. Thus, Red helps to increase circulation in poorly perfused regions of the body, thus it has a helpful effect in conditions where arterial problems exist such as varicose veins.
3. Red glass is wonderful in barn windows to keep animals healthy.

Editor Note: **The Emunctologist should know that the Cleansing of the Colon, and a Healthy Diet is the first and foremost, and immediate Therapeutic-Hygienic measure for any such conditions, along with Osteopathic and Chiropractic measures. Hydropathy, Osteopathy, Chiropractic, Healthy Diet, Exercise, Light-Therapy (Using the Correct Colours): These Therapeutic Measures, in this order, are indeed those which are the Most Helpful, and Useful in obtaining immediate results. The seeker, should "Forget Not To Pray".**

The Clinical Work of the Munich Society for Light and Colour Research, in the 1920's, shows that Red Light, was used successfully in the Treatment of Diphtheria. The patient was dressed in White clothes, then placed under Red Light, and bathed in Red Water for between 1 to 2 hours. And a Complete Healing was obtained, after 15 days. Red Light Therapy, was also successfully used, in the Treatment of a patient suffering from: Complete Physical Exhaustion. Records from the Research Society, also show that Red Light Therapy, using light bulbs painted Red, where used in a successfully manner in the Treatment of Erysipelas (common bacterial infection on superficial layer of the skin, extending to the superficial Lymphatic vessels within the skin; characterized by raised, well-defined, tender, bright-red rash, typically on the face or legs, can occur in any part of the skin).

Ultraviolet Colour

1. Ultraviolet: Irritates the vascular nerves, the light is absorbed more quickly, with a strong healing effect.

2. Red violet works well against Epilepsy.

3. Silk worms grow faster under Violet light.

4. Violet was found to have a strengthening, and Calming Effect upon Severe Nervous Disorders.

Greater Benefit is obtained, with the simultaneous use of both Violet Light, and Violet Rays Therapy.

Colours Can Help to Transform Life

Buildings and Rooms should be specifically colour matched; to their purposes. Thus sociable rooms, should have vibrant, life, beautiful colours.

Colours enhance the purpose of the rooms and buildings.

Vibrant colours have a positive effect on depressed individuals, certain colours are uplifting, and help to create joy.

Also the use of Colour in Clothes, these have a great influence on the well-being of those who wear them.

For the right colours give zest for life, certain colour give increased self-esteem, increase the drive for activity, and are a source of joy.

Thus, we know that with the use of Colours, we can Help to Transform Life.

Colour Light Therapy & High Frequency Therapy

Nikola Tesla in 1891, was the first to suggest the use of High-Frequency Currents in medicine.

"High-Frequency Therapy is indispensable to physical therapy; and indeed to the entire field of medicine. Its development is closely connected to that of electrical engineering, which created the prerequisites for it. The first step on this long road was the generation of high-frequency alternating currents, after Nicola Tesla had designed the first high-frequency transformer in 1891.

A year later, the currents obtained in this way were analyzed by the French physiologist D'Arsonval to ascertain their suitability for use in medicine.

The method uses strongly damped oscillations, of very short duration, of a high-frequency alternating current.

The oscillations are interrupted by pauses lasting about 500 times as long as the oscillations themselves.

Joules's heat (generated in the tissues during the process) is, however, too weak to produce actual heating.

The effect of Arsonvalisation is essentially based on the superficial stimulus released by the transfer of effuvia and sparks.

Arsonvalisation was therefore used mainly as a means for stimulating the skin for the treatment of hyperaesthesia and paraesthesia, neuralgia of nerves located near the surface, and of local disorders of the blood circulation.

Since Arsonvalisation of the entire body has a certain sedative effect, it has also been used for the treatment of insomnia.

The resistance heat generated in the body during treatment with High Frequency Currents was used for the first time by von Zeynek (thermopenetration) and, independently of the former, by Nagelschmidt, who called this process Diathermy. The introduction of Shortwave Therapy in medicine depended on the manufacture of powerful generators.

In this connexion, the development of suitable thermionic valves by the Jena physicist Esau in 1925 was an important step forward.

Diseases of the Digestive Organs

In illnesses of the digestive organs, especially the spastically caused conditions of the alimentary canal and of the gall bladder, in addition to chronically inflammatory processes, can be considered for shortwave therapy.

The Beneficial Effect of Heat Applications in this area has been well known for ages. Spasms of the oesophagus, the cardia, the pylorus, the entire intestines and the gall bladder are treated with good results by shortwaves.

The same applies to Constipations caused mainly by spasms. Kiare reported recently on good results following High-Frequency Therapy applied locally.

Out of 108 patients suffering from an ulcus duodeni, 60% were relieved of their complaints, and out of 35 patients with an ulcus ventriculi, 54% were relieved. He used, however, a probe electrode specially designed for this purpose, by means of which he irradiated the stomach or the duodenum directly with a 1 metre wavelength.

Cholecystitis and cholangitis are treated with good results by shortwave treatment in the acute as well as in the chronic stage.

Frequently, the complaints are relieved as early as in the first treatment sessions.

A simultaneously existing obstructive jaundice is not necessarily a counter-indication.

Various authors also reported on good results in the treatment of chronic and epidemic hepatitis ,as well as liver cirrhoses (Rechou, Schliephake, and others).

Quite good results are obtained in the posttreatment of laparotomies, regardless of whether the complaints are caused by inflammatory residual infiltrates or adhesions. The same applies to inflammatory residual conditions in the area of the periproctium. Colica mucosa and especially nonulcerous colitis a respond well to shortwave irradiation.

The effect of chloromycetin can apparently be intensified thereby (Schliephake).

An attempt at Hyperthermy (elevate the temperature) of the entire body is recommended from the outset in chronic cases.

In almost all treatments in the area of the: Throat, Nose and Ears, all 3 possible methods of High-Frequency Therapy can be applied in principle.

Treatment in the condenser field, performed exclusively with air-spaced condenser electrodes, permits more intense irradiation of the organs located farther inside the body (pharynx, tonsils, sphenoid sinus), and also simultaneous treatment of both Highmor sinuses, ears, etc.

Diseases of the Teeth and Jaws

Diseases in the area of the Teeth and Jaws (especially inflammatory processes respond well to a supporting treatment by shortwaves.

This applies especially to chronic forms of osteomyelitis of the jaws, with and without fistula formation, perimandibular periostitis, and infiltrates of the floor of the mouth. In Preventive Dentistry, inflammatory processes and pains following root fillings, pulpa extirpations and pains in apical oedema formations are mainly the preferred indications for High-Frequency Therapy.

In the treatment of Neuritis, especially that occurring after inflammations or lesions of the mandicular canal through the dislocation of root tips, the application of an anaesthetic, which is limited in time, has yielded good results in combination with High-Frequency Therapy (Romanowsky and Stelter).

A Prerequisite For Success Is The Preliminary Elimination Of The Local Cause. Neuralgias in the area of the trigeminal nerve, or the so-called "'genuine trigeminal neuralgias" are therapy-resistant to a great extent, if any kind of heat therapy is applied.

Acute Arthritis of the temporomaxillary joints usually responds favourably to shortwave therapy. The same applies to all inflammatory irritations of the temporomaxillary joint which are due to Rheumatism.

Diseases of the Eyes

In the field of Ophthalmology as well, some diseases can be treated by shortwaves, with good results.

Although high-frequency therapy is usually indicated in this field, as well as in others, whenever any type of **Heat Application has Proved to be Successful, It Is Superior to the other methods in Many Cases, especially because of its Depth Effect, and the Increase of the Local Liquid Metabolism.**

This applies mainly to Diseases of the Rear Eye sections, which can only be treated directly by way of shortwave irradiation.

Gloz was able to observe an effect on the vessel system of the fundus as early as 15 to 30 seconds after irradiating the head.

Contraindications

In all Tumours, and Splinter Injuries of the eye, where the foreign body is still located in the eye, any type of high-frequency therapy is Counter-indicated.

The same applies to all diseases of the retina vessels with a tendency towards bleeding, bleedings of the retina and atherosclerosis of the retina vessels as well as glaucoma.

No treatments at all must be performed during Anaesthesia, and in all cases of sensibility disorders; otherwise overdoses may easily be given." - Dr Harald Thom, MD, in "Introduction to Shortwave and Microwave Therapy", 1966.

Physiologic Possibilities of Heat Therapy

"There exists today a better understanding of the Physiologic Possibilities of Heat Therapy, on account of discoveries in the field or radiation physics which have furnished new and perhaps superior methods in creating and localizing heat within the body.

Ultra- or super high frequency current, has been critically investigated on a large variety of material at different times during the past decade.

Studies of the confirmation that currents of ultra-high frequency definitely provoked deep heating effects, the intensity of which could be so regulated as to produce healing or lethal effects in living tissue.

Value have been the recent contributions by Whitney, Carpenter, Knudsen, Bell and Ferguson, regarding its physical and physico-chemical aspects, and King, Neyman, and their co-workers, regarding its clinical effect.

From the conclusions of all these reports it has been established beyond preadventure of doubt that **Fever Therapy as produced by High and Ultra-High Frequency Current definitely provokes favourable effects in certain Chronicities, associated with, or without, Allergic Phenomena, as also in General Paralysis of Insane, Encephaloid State, and others.**

Many other intractable conditions, are now under investigation by means of artificial fever therapy and is already, even at this early period, giving promise of favourable results.

That production of **Fever by High-Frequency Current is a superior method to that of infecting the patient with malaria or other organisms.**

It has furthermore given a new orientation in connection with the management of certain forms of Dementias which may be the starting point for a more vigorous offensive in the Treatment of the Insane.

Fever Therapy has been the Outstanding Contribution of High-Frequency Practice." - in "Archives of Physical Therapy", December 1931.

Applications For High-Frequency Therapy

"The application of High-Frequency Energy in Heat Therapy has the advantage of greater depth penetration, as opposed to simpler methods, such as packs, baths, infrared light, and heat cushions.

The endogenous heat that is formed triggers a series of Physiological Processes:

1. Producing a Spasmolytic Effect on muscles, tendons and other structures containing connective tissue,
2. Increasing the cell metabolism, and
3. The enzyme reaction speed and stimulating perfusion in the treated zone.

The capability of applying the high-frequency energy in: short, intense pulses (pulsed mode) can further increase the depth effectiveness, especially the stimulation of perfusion, while the heat generation is hardly felt in the skin, which is more sensitive to heat.

The applications for High-Frequency Therapy are diverse:

It is especially Effective in Treating Rheumatic disorders of the joints and muscles, inflammatory disorders of the respiratory organs, kidneys and bile ducts, and all disorders due to insufficient perfusion.

The pulsed mode is advantageous in the treatment of acute conditions.

In Gynaecology, High-Frequency Therapy is used especially for stimulation of resorption and perfusion in case of chronic adnexitis and non-inflammatory disorders in the lesser pelvis." - in "Operating Instructions Physiotherm-S", 8 April 2009.

What is High Frequency Therapy?

"High-frequency current is the collective name for high-frequency alternating currents. With alternating current, roughly the following occurs in a line. It starts with a weak electric current, which becomes increasingly stronger, then reaches a certain peak and finally slowly decreases to Zero; this process repeats. We call such a process a period. If this process repeats, for example 50 times per second, we speak of a current with 50 periods. We can also say: "the current has a frequency of 50 changes per second." The word "Frequency" therefore, "refers to the number of changes per second." If the Frequency is not, as example 50 per second, but approximately 100,000 or more, then we speak of a very high frequency. Thus, High Frequency. High-Frequency Current is therefore Alternating Current (AC) whose strength changes a very large number of times per second. If such an alternating current is passed through an electrolyte and the frequency is chosen high enough, electrolytic splitting will begin immediately after the change; however, because the current immediately changes strength again, this effect is reversed in the second half of the period. **It is striking that Alternating Current (AC), and especially high-frequency current, does not have a harmful effect on the body, unlike, for example, Direct Current (DC). Very high voltages can be used with high-frequency current without any harmful effects occurring, as occurs with low-frequency alternating current at high voltage.** This harmlessness of high frequency is certainly one of the main reasons for the extensive use of high frequency for healing purposes.

How Does High-Frequency Current Work?

According to Professor Dr Louis C. Barail, MD, DDS, the Physico-Chemical effect of High-Frequency Current is divided into 3 parts:

1. Mechanical Effect:

I. Beneficial effect, obtained through electroMassage, the spark, and the current;
II. Destructive effect, obtained through fulguration, w**ith the help of which germs can be killed electrically.**

2. Radiation Effect: The spark, and even more so the current, are accompanied upon their emergence from the electrode by the appearance of violet rays, which greatly increase their germicidal power.

3. Chemical Effect: The spark, and even more so the current, cause new atomic groupings in the oxygen in the air, transforming it into ozone, O3. The well-known antiseptic effect of Ozone is complemented by that of the Violet rays, which are produced simultaneously. Furthermore, the heating effect, which everyone can control for themselves, should be mentioned. **The result of this**

heating is increased blood circulation and an increase in lymph in the vicinity of the electrode. This, in turn, **improves the blood circulation** in the treated area. However, since we have a coherent blood and fluid circulation, **this local stimulation of the fluid flow must eventually reverberate throughout the body; ultimately, this results in a lasting strengthening of the entire fluid circulation within the organism.**

How Does This Work?

The increased, accelerated circulation of the fluids enables an improvement in the supply and discharge of fluids, a promotion of metabolic processes. The nutrients absorbed in the blood and lymphatic vessels are now transported more quickly to the organs, and the removal of accumulating and newly formed metabolic products is also carried out more thoroughly. These processes, so important for any healing process, are further supported by the increased Oxygen supply and the enhanced elimination of carbon dioxide and urine.

The effect on the kidneys is noticeable in increased urine output. From this list of effects of high-frequency treatment, its consequences are readily apparent. **One can understand that pain diminishes and disappears; An explanation is found for the promotion of healing from colds, inflammations, and suppurations. The improvement in general condition, the strengthening of the entire body, especially the nerves, is based on entirely natural foundations.**

The often astonishing results of High-Frequency Treatment are the entirely natural consequence of its effect on general bodily functions." - in "Gezondheid Genezing En Herstel Door De Hoogfrequente Stroom", 1929; also in Medical Weekly "Die Medizinische Welt", 1929.

High-Frequency Current

"A High-Frequency Current; is one characterized by the high number of cycles completed in 1 second of time. It is a modified alternating and oscillating current.

Alternating Current (AC), is an Electric Current, that Periodically Reverses Direction, and Changes its Magnitude Continuously with Time, in contrast to Direct Current (DC), which Only Flows in 1 Direction. The ordinary Alternating Current (AC), which completely reverses itself 120 times per second is known as a 60-cycle current.

It Requires:

1 (+) Positive Alternation, and
1 (-) Negative Alternation to complete 1 Cycle.

Positive Alternation; is the part of an Alternating Current (AC) waveform that shows a (+) Positive voltage or current. In a typical AC sine wave, this represents the half-cycle, where the current is flowing in 1 direction, as Opposed to the (-) Negative alternation where the polarity, and current direction reverse.

Negative Alternation; is the portion of an Alternating Current (AC) sine wave's cycle where the current or voltage is (-) Negative. Meaning it flows in the opposite direction or is below a reference point.

Electrical Power Source

The Alternating Current (AC), is the usual source from which a High-Frequency Current is obtained. When only Direct Current (DC), is available, a motor generator for changing it to Alternating Current (AC) is necessary." - Dr Burton Grover, MD, in "High Frequency Practice for Practitioners and Students", 1923.

Violet Rays

The Violet Emitters used in Violet Rays Therapy, are also called Violet Rays Generators; because they only Emit Electricity at:

1. Very High Voltage, and at;
2. Very High Frequency.

There Are 2 Types of Violet Emitters:

1. Analogue.
2. Non-Contact.

Colour Light Therapy & High Frequency Therapy; Have a Logical, and Sequential Relationship.
High-frequency Therapy requires, High-Frequency Apparatus, and its preformed with: Attachments called Electrodes.

High Frequency Contraindications and Precautions

> ***"High-Frequency Currents are contraindicated in all closed cavities containing Pus. Care should be exercised in the employment of any electric modality in the aged, as their organs are frail and very sensitive to electricity in any form."*** *- Dr Burton Grover, MD, in "High Frequency Practice for Practitioners and Students", 1923.*

In addition, any external signs that might point to the existence of contraindications (e.g. scars, etc.) should always be reason enough to ask the patient about contraindications!

Contraindications

“Non-exhaustive List of Contraindications, should always be observed when applying short-wave treatment for therapeutic purposes!

1. Always be sure to ask the patient about these contraindications, as not all contraindications are immediately recognizable by the therapist (e.g. pregnancy)!

2. In addition, any external signs that might point to the existence of contraindications (e.g. scars, etc.) should always be reason enough to ask the patient about contraindications!

3. As a rule, any short-wave therapy must be strictly based on an accurate diagnosis!

Absolute Contraindications

Absolute Contraindications to Short-Wave Therapy:

1. Patients with a cardiac pacemaker may under no circumstances be subjected to short-wave therapy. The effects of the applied high frequency on the pacemaker could cause ventricular fibrillation. Any other persons with pacemakers must also remain outside of the treatment area during the short-wave therapy!

2. Patients whose condition could be negatively affected by heat.

3. Patients with Tuberculosis.

4. Patients with Haemorrhages, or risk of haemorrhage.

5. Patients with Septic conditions, and Emphysemas (Chronic Obstructive Pulmonary Disease, that causes progressive damage to the air sacs (alveoli) in the lungs, making breathing difficult and leading to symptoms like shortness of breath, persistent cough, and wheezing).

6. Patients with malignant tumours, and tumours that are not yet identified. (Schneider in Elektrinedizin 7/62: Tissue and organ sections with inflammations, necroses, pus formation and abscesses. In such cases, the therapist must choose between the application of cold or heat in accordance with general pathological considerations, depending on the degree of inflammation. Inflammatory conditions that are still in “statu nascendi” are treated with cold. Inflammatory conditions with necroses and a cavitary tendency are treated with therapeutic means that generate heat and hyperemia. Chronic and unspecific inflammations are treated in the same way - heat and hyperemia - as this supports resorption, reparation and regeneration.

Specific chronic inflammations - such as tuberculosis - however, are activated by heat. Accordingly, they represent a contraindication. The same applies in the case of malignant tumorous conditions. Heat application in the case of a tumorous disease can only be regarded as malpractice. Moreover, cardiac congestions must be removed prior to any heat application).

Local Contraindications

Local Contraindications to Short-Wave Therapy:

1. Implants or metal inclusions (The higher conductivity of metals causes concentration of the field, producing a high temperature in the border area of the tissue. This in turn can cause excessive local heat, leading to (irreparable) third-degree burns. Therefore, caution is also necessary in case of long-existing metal inclusions, such as shell fragments).

2. Implants that could be impaired by short-wave irradiation.

3. Swellings that still feel warm.

4. Thermohyperesthesia.

5. Thermohypesthesia.

6. Acute inflammations.

7. Severe arterial obstructions (stage III and IV).

8. Gynaecological disorders involving acute inflammation (Further contraindications relating to gynaecological disorders include (see Mobius, Gynaecological University Clinic, Jena): genital tuberculosis, endometriosis, pyosalpinx or pyo-ovarium, tubal carcinoma).

9. Wetness, perspiration or damp bandages.

10. Permeating irradiation of the thorax in cases of severe heart diseases (heart valve diseases, myocardial insufficiency, myocardiac infarct, severe coronary sclerosis).

11. Pregnancy, since irradiation of the abdomen could cause teratogenous damage due to alterations of blood circulation and diffusion.

12. During the menstrual cycle.

13. Sudeck's syndrome, stage I and II.

14. Basedow's disease (irradiation could cause serious states of agitation).

15. Varicose veins (irradiation could cause congestive pain).

Warning

We would like to point out that it is advisable to post warnings for wearers of pacemakers in the rooms where high-frequency therapy (e.g. short-wave therapy) is applied. Moreover, a distance of at least 6 meters must be maintained between the unit and any low-frequency therapy that is being carried out at the same time!

Particular Importance

Particular care must be taken if the patient's clothing is wet or damp, since the garments may heat up faster and more intensely than the patient's body. Synthetic fibres (perlon, nylon, etc.) are characterized by low absorbency, which can cause the skin beneath such fabrics to quickly become moist. Therefore, it is recommended that the body areas to be treated be completely unclothed and the patient's skin dried, particularly where perspiration accumulates in folds of the skin. This applies especially when a higher dosage is being applied. There is no danger, however, when applying short-wave irradiation to bandaged areas as long as the bandages are completely dry.

1. When treating small children, particular care is obviously required, due to the low body weight. Very careful dosing and constant observation (manual checks of the skin temperature while the unit is switched off) are necessary.

2. Since the effects of high-frequency fields on unborn life have not yet been sufficiently researched, we recommend that operators who are pregnant do not remain in the immediate vicinity of the applicator when the unit is activated.

3. The output power must always be set according to the subjective response of the patient! Therefore, special care must be taken in case of patients with a diminished capacity for perception of heat (refer to section Dosage levels according to SchHephake on page 12)." - in "Operating Instructions Physiotherm-S", 8 April 2009.

Mode of Action of High-Frequency Currents and their Influence on Circulation

"According to Prof. Mann, the essence of the Effect of High-Frequency Currents is based primarily on the stimulation of a skin stimulus, that can be adjusted both by regulating the current supply, and by the more or less short distance of the electrode from the body part to be treated.

In addition, Heat generated in the tissue itself, similar to Diathermy, Can also be Considered a Therapeutic Benefit. Furthermore, the slightly increased blood circulation in the treated tissues is considered a result of high-frequency treatment.

The influence on circulation is probably also responsible for the fact that many patients feel more strongly stimulated after high-frequency treatment, which consists of stroking the extremities and back with the flat electrode and lightly sparking.

One can therefore describe such a treatment as well-advised for all kinds of Debilitating Conditions, Neurasthenic, and otherwise.

Likewise, in functional disorders associated with all kinds of discomfort emanating from the internal organs, such as cardiac neuroses, gastric neuroses, etc., it is justified to treat the corresponding parts of the body with mild high-frequency currents, based on a draining and circulation-regulating effect.

This treatment often has a beneficial effect, especially in Cardiac Neuroses." - in "Hoch Frequenz Fur Kranke Und Gesunde", 1930.

High Frequency Electrical Treatments

"The great clinician Professor Dr Mann has rightly complained that the German medical world has kept silent for decades about this research, from which so much blessing has come to humanity today, and which could have been a source of blessing for us long ago!

An Austrian doctor, an honest and wise researcher, **reports about his wonderful successes, in the Treatment of:**

1. **Sciatica.**
2. **Neuralgia.**
3. **Rheumatism.**
4. **Severe Tumours.**
5. **Etc.**

He was able to quickly and effectively treat patients who had been in hospitals for weeks and had tried everything. Many other doctors write to me similarly.

I have often Cured Sciatica in 3-5 treatments, and so have our doctors.

He sees that they are beneficial, and he can monitor their effects many times over and often make them even more beneficial through his experience.

A doctor writes to me that; he has used these currents successfully against:
1. Paralysis.
2. Calcifications.
3. Severe Neuralgia.
4. Etc.

Severe Skin Diseases and a persistent intercostal inflammation with sleepless nights were cured with them, and a Malignant Case of Acne Rosacea, and Purpurea (which had completely disfigured the patient's nose, so that he became a laughingstock because his nasal deformity was considered a drunkard's defect); improved considerably in a short time.

A teacher from the countryside came to me.

He had helped him and his family with all of life's major and minor ailments, protected his children from all possible health risks, and **cured himself of Sciatica in 3 treatments.** A number of letters confirm to me that people in remote mountain corners, **were able to relieve their Neuralgic, Rheumatic, and even Gouty Complaints on this place.**

How many happy people have been created by this, who can now walk straight and pain-free again and know that they have a reliable helper in the event of relapses in this procedure.

A nun had vocal cord paralysis after 3 goitre operations.

The specialists could not help her, and we helped her with extensive direct and indirect treatment. She was still able to sing in the choir in the evenings, and when she had a relapse after a few months due to overexertion (school nurse), **she took her appliance back in hand and made the illness disappear once again.**

A merchant had **3 unfortunate patients suffering from Severe Nervous Disorders,** affected children; the doctors in his area didn't know how to help them, and the man tried everything.

Finally, he came to us, **underwent a home cure; according to our instructions, and soon wrote to us the following:**

> ***"After a few weeks of regular treatment, the oldest boy seems to have made a clear difference. His muscles have become much firmer; he has gained great courage to try to heal himself. With his sister, who is too limited in her movements, at least the success has already been achieved that she can fall asleep very well in the evening, which is no longer the case as soon as we stop even for a day. The youngest boy also feels a relief when walking; as soon as we stop, he has pain in his ankle."***

Cures, or Significant Improvements in Paralysed Patients are often reported to us; these are usually Strokes as a result of Calcification. A gentleman who was a heavy smoker and had already suffered several **Minor Strokes is now cheerful and laughs at his former ailments, which he has now completely shaken off.**

In the face of such healings, can one still speak of imagination and superficial effects? **Isn't it rather quite clear how these currents intervene by liquefying the blood through their fine vibrations, gradually breaking down the blockages in the blood vessels and the various deposits?**

Simply through the Ozonization of the blood, that occurs during Radiotherapy, we remove waste from the red blood cell, and thus allow it to circulate faster. Will this aid, and explain why Visual, and Hearing Impairments Are Eliminated or Improved by the use of these Currents.

Almost, every experiment has been convincing!

By means of the Fine Vibrations, obstacles in the relevant organs are removed, and fatigue-causing substances, and the conduction pathways are freed for Visual and Auditory Function.

All of these Rejuvenation Processes brought about by the High-Frequency Currents, which also occur in a similar way in the Digestive, and Reproductive Systems, among others, were discussed in detail in my larger work on Rejuvenation (New Paths to Rejuvenation, Prof. Ewald Paul, "Neue Wege zur Verjüngung", 1926).

Conditions Treated by High Frequency Currents

Records published in the "Mitteilungen" Bulletin of the "Scientific Society for High Frequency and Light Research", Germany/Austria (from 1928 to 1933), show the following List of Conditions as Successfully Treated, by the use of High Frequency Currents:

1. **Acne.**
2. **Asthma.**
3. **Arteriosclerosis.**
4. **Brain Diseases.**
5. **Bladder Disorders.**
6. **Bone Neoplasms (tumour either: Non-Cancerous or Cancerous).**
7. **Cataracts.**
8. **Colds.**
9. **Consequences of Stroke.**
10. **Depressive States.**
11. **Ear Infections.**
12. **Ear Diseases.**
13. **Eczema.**
14. **Eye Diseases.**
15. **Fistulas.**
16. **Flu.**
17. **Flushing.**
18. **Gastric Descent.**
19. **Gonorrhoea.**

20. **Gout.**
21. **Haemorrhoids.**
22. **Hair (Sprouting Again).**
23. **Hay Fever.**
24. **Heart Attacks.**
25. **Knee Joint Injuries.**
26. **Lung Ailments.**
27. **Nervous Distemper.**
28. **Painfulness.**
29. **Paralysis.**
30. **Paralysis caused by Strokes.**
31. **Prostate hypertrophy.**
32. **Rheumatism; Severe Rheumatism.**
33. **Torn Ligaments.**
34. **Trigeminal Neuralgia.**
35. **Tuberculosis.**
36. **High Frequency Therapy has great success against Sciatica.**
37. **Etc.**

In Animals, the High-Frequency Treatment also works.

Records show great successes in both Horses, and Dogs ("Mitteilungen, Treasures of High-Frequency Therapy", 1928-1933).

Clinical Knowledge

"Soon after the start of vigorous treatment, symptoms often become noticeable that suggest rapid healing, but which very soon give way to a serious setback (Editors Note: the famous "Healing Crisis"). Thus, sometimes in those who have been paralysed for years, the ability to walk suddenly appears, only to disappear after several days. In such cases, it is usually patients whose inner driving forces have already been exhausted. It is only the last and futile endeavour of the life force, and therefore it is wise not to make any further attempts at force in organisms that are already exhausted, but rather to limit oneself to combating the individual symptoms, such as pain, insomnia, etc., which at least achieves something. The practitioner recognizes very quickly where all the effort is in vain and then abandons corresponding energetic measures from the outset in order to spare oneself and others disappointment. **We have collected knowledge upon knowledge, also learned to better evaluate inhalation with the help of high-frequency currents; we have seen some inhalations performed calmly, preceded and followed by a good, calm exhalation, even for several minutes, and repeated several times a day, have Very Beneficial Effects, even in cases of heart failure, calcifications, and old mucous congestion in the respiratory organs, as well as in cases of various fresh catarrhs.**

A simple inhalation can never achieve the success achieved with the

simultaneous use of high-frequency currents, which they reach the innermost depths of the respiratory organs, shake up the stubborn mucus, invigorate the blood, and disperse the essential oil used in the inhalation device everywhere, cleansing, purifying, and destroying germs.

I Have Seen Wonders Upon Wonders. Once, it was a case of a girl who had been Paralysed for 17 years, whose bronchi were severely blocked due to lack of exercise. A few short, but smoothly performed inhalations brought out old, hardened pieces of mucus, so that we were quite astonished.

And so I also used this method to stimulate blood circulation in cases of Obesity, calcification, etc., with excellent results. But you have to do it correctly, not, as some treatment instructions say: do 5 or more minutes of inhalation, because that is too much and does harm instead of good.

Or as the erroneous illustration in a manufacturer's treatment book teaches that one should grasp the wooden handle in which the inhalation electrode is inserted, which is nonsense, because the hand must be placed around the glass center of the designated electrode, because contact of the hand with the charged electrode generates copious amounts of Ozone, which, however, does not occur otherwise.

And then, above all, every inhalation should be carried out calmly; the calmer we are during treatment, the better it will benefit us.

Today's life and activity disrupt the harmonious functioning of body and soul everywhere; we are full of haste and restlessness.

The High Currents strive for, and achieve the return of rhythm and harmony to the subtle vibrations of life, but it is clear that they must work harder the more restless and disordered our body and soul's workshop appears.

So, if we place body and spirit in the most calm state possible, if we also allow it to cooperate from within with rhythmic-harmonic vibrations, through good, firm will; then the currents flowing in from outside will draw their circles even more easily into those of their needy, sick, or weakened organs.

Many experts confirm that one can truly work effectively with these currents, even on the finest structures of the human being, such as the eyes.

One of them, for example, states that his results in the treatment of eye diseases with frequency currents are good and numerous.

An expert writes that: For various types of Neoplasms (Tumours) on the eyelids, this treatment is better than all other methods, and that High-Frequency Currents offer unimagined relief for:

1. **Hardening.**
2. **Sclerosis.**
3. **Iritis.**
4. **Haemorrhages of the Choroid, and Retina.**
5. **Etc.**

However, no damage to the eye from such treatments has ever been detected.

I saw this in a case of iritis in a young man suspected of having tuberculosis, for whom specialist treatment had not helped at all, so that after a one-sided operation, the patient was simply left to his fate.

For the sake of scientific research, I then **performed several treatments** that, after an initial minor reaction (some pain in one eye), **showed quite astonishing success:** the patient saw better, no longer had the fixed gaze, and also felt more comfortable in the operated eye.

I would also like to mention **the case of Glaucoma in an elderly lady, in whom a few mild treatments, even indirect ones, resulted in a slight and rapid improvement.**

One can see that these subtle currents penetrate everywhere in an invigorating and purifying way, and that with them much more can be done with them than one might imagine.

With them, one can gradually reorganize the entire constitution, as we have seen in cases of serious internal ailments, and severe tumours.

The Path To Healing is clear to us: it means reorganizing the constitution, the innermost workings of the body; reinforcing the Endocrine Glands, on which more than one might think depends in the development of Cancer, to their proper functioning (See: New Paths to Rejuvenation; 1927).

If we succeed in this, the cancer cell, and any bacillus (that has not yet been proven to exist), will disintegrate into nothing.

That our Subtle Forces intervene helpfully, where the stronger ones fail is demonstrated by the fact that the so-called X-ray Carcinoma, can be cured using High-Frequency Currents, something that French clinicians only recently admitted again, after we had previously claimed. **We still face so many mysteries in this matter, and we must free ourselves even more, from our materialistic views, in order to then Be Able To Find the Correct Understanding of this Very Subtle Forces. Everywhere we look, Electricity, and probably Radium, are distributed in nature, among other subtle forces: we find them in all substances of creation, in tiny quantities, but as obviously indispensable ingredients; it is therefore assumed that: All Matter Also Consists of Electricity.**

One researcher calls our reproductive substances “material systems with a spiritual charge.” We do not yet know our most Secret Life Forces; but one thing is certain: They Are Subject to Electrical Oscillations of the finest kind, and that the smallest, most delicate cell of our Ego Exists in the Electrical Mechanism.

This also explains the miraculous influence of High-Frequency Currents on our entire well-being. The Cosmetic Benefits of High-Frequency Currents; also testify to their profound effect: large birthmarks, entire clusters of warts and sebaceous glands have often been removed in a short time and always without danger or actual pain. A man from Hamburg wrote to us, that he had **managed to make his battle scars almost invisible through Frequency Treatment.**

So you can see that **these Currents Also Have a Balancing and Regenerative Effect, Inserting New Cells.**

Treatment Instructions

Treatment Instructions, which in most cases have to be completely changed if one wants to achieve completely different results than before.

I must first note that we receive a great many inquiries requesting precise minutes for the treatment duration; the remark “as needed” doesn't satisfy people, and yet sometimes one has to say so. Because people are never the same, and neither are the devices, nor the current. There are devices that develop a very strong current from the outset, and others that work very gently. How can one come up with a template in this case? There are times of day when the power grid is well supplied, and strong currents quickly begin. And there are people for whom setting the appliance to low already allows for a good preliminary treatment, and for whom the need is completely met at the middle setting. So, your own feeling has to decide, and I therefore advise everyone to start with mild current and gradually increase it. Starting with strong current right away is rarely necessary. It is possible that, in a robust person and in a suitable case, such as severe ischia or rheumatic disease with heavy artillery to achieve the goal more quickly, but in general, we prefer mild treatment and thus achieve the same as with strong treatment — only that it may take a little longer, requiring a few more treatments, but this also has the advantage of never overstimulating the patient by using too many. I also like to allow 10 minutes of self-charging as a preliminary treatment for a day or a few days, for example, in cases of general blood and nervous weakness and similar conditions, and only then begin the direct treatment. **I also use the neon gas electrodes, mentioned at the end of our article, more often than before, because I have had good results, and they have served me well in inflammatory conditions.** For example, **for sore throats, the appropriate neck electrode with neon gas is good, and for eye problems, the special electrode designed for that purpose, etc.**

I also use Settisan (Robusta an ointment with plant extracts obtained from southern plants and mountain herbs, used as a cosmetic and nerve tonic), as a good helper, because this ointment strengthens the nerves and muscles, and the high-frequency currents get our body's machinery working more actively, but a more powerful machine also needs to be well-oiled.

One can also achieve one's goal without such an ointment, but it often provides a welcome relief and accelerates the treatment.

Never Overdo It

And “Never Overdo It” is the main rule!

We would have achieved much better results if so many people weren't prone to overdoing it!

Professor Dr Bier, one of the most important physicians of our time, recently said that it was fortunate that the sun doesn't always shine, because otherwise our dear patients would overdo it.

We have to keep the Polarity of things in mind: Placing Shadow Next to Light & Rest Next to Movement. I also saw much Better Results when patients always Rested a Little After Treatment. And for the same reason, I recommend a rest period every week or every 4 to 5 days; **the body will then be finished distributing and processing the absorbed energies,** and ready to receive new energies. **Everything Vibrates; in and around us, and from small causes, great effects arise. Our Body, and our Soul, Have Vibrational Abilities of which: few have any idea and now the new impulses of the High-Frequency Currents are joining them, giving the vibrations within us an ever-broader range of power, somewhat similar to the vibrations of a swing, which increase ever more through constantly renewed impetus.** From this example, one can also see that: **the fine and moderate vibrations, the gently working currents, can also lead to healing,** because they gradually move into an ever-broader field of action. **We must learn to regulate the Vibrational Forces in our bodies,** prevent their harmful effects, and use them only for healthy work. **This Commandment has never been more necessary than today, when, through overexertion of our strength in many things, in physical and mental work, and especially in sports, we have all too often lost control of the totality of our life vibrations**, so that **the impulses of the High-Frequency Currents with their invigorating and yet at the same time calming, because strengthening and ordering power, are true benefactors for humanity, as a whole and will be to an even greater extent.** Many examples can be given for a better understanding, for example, the well-known fact that the power of amplified sound vibrations can shatter glass as soon as it reaches its vibrating level. **And so, are the fine vibrations that we experience with the High-Frequency Currents into the body or unfold in it, capable of resolving serious disturbances within it, of stirring up old disease substances and flushing them out.**

Endocrine Glandular Functions

And now comes the important question of the so-called Endocrine Glandular Functions, about which much light still remains to be shed, and we ourselves have gathered much new, valuable observational material, which found its place in our work on Rejuvenation. There is no doubt that The Treatment of Many Illnesses, and States of Weakness would be far More Favourable if, in addition to local treatment, a general stimulation of the Internal Glandular Mechanism were also used. For the Connections Between these Glands (which influence the most vital functions), are so diverse that the stimulation of a Gland often creates the most complicated conditions and triggers disturbances where help was required and could be expected. On the other hand, the inhibition of all or the main ones of these Glands is of great value, and often produces surprising results in conditions where one would not have expected such results. By discontinuing such treatments, the usual treatment regimens gain a great scope, and must be supplemented accordingly if they are to be effective, and lead to better cures.

So Where are These Endocrine Glands, and How are They Treated?

First of all, we have the Thyroid and accessory glands (usually 2 on each thyroid lobe), in their functions considerably independent of the thyroid; 1 is usually located above, 1 below the thyroid lobe. By irradiating these parts as well, i.e., **the further areas around the gland, the internal secretion of humours, the regulation of Iodine, and other metabolic processes are significantly enhanced.**

Next comes the Thymus Gland, located in the upper chest, which sometimes grows down to the heart, but usually atrophies in young people. It presumably serves growth and blood formation, and has also been attributed an influence on the sexual organs. **I tend to irradiate each upper chest area frequently, which proves beneficial in conjunction with the treatment of the other glands.**

Next, I consider the Pituitary, and Pineal Glands, which I influence by irradiating the top of the skull for 1 minute, and the occiput and upper neck region for 1-2 minutes every other day with a mild, gradually increasing current.

A short irradiation (half a minute) can also be used occasionally.

Liver and Spleen

Now, we come to the Liver and Spleen, whose short (2-3 minutes) irradiation and (1-2 minutes) treatment are often very beneficial, as our experience shows.

Gonads

Finally, we have to consider the Gonads, and other tissues related to the reproductive process: Testes, Ovaries, etc., **which, with proper treatment, enable very significant changes in the organism.**

For many people, it is beneficial to enliven their abdominal organs of this type with a moderate current every other day for at least a few minutes.

Also 1-2 minutes of Neon Light. It is even better to irradiate the entire abdomen with Violet Light 4-5 times a week (a total of 3-6 minutes, depending on the patient's condition), and with gradually increasing current: the Pancreas, and the Intestinal Tract, and Gastric Mucosa are thereby promoted in their functions.

Short Radiotherapy can also be used here, i.e., a Violet Electrode raised about 1 cm or more, perhaps also the very powerful brush or the so-called nerve brush with its numerous extensions, for about 10 seconds, even minutes, gently moving back and forth over the entire area, but always at a suitable distance.

Naturally, never on a full stomach, but only 2 or 3 hour after eating.

In this way, we exert a strong stimulus on the basic cell, which carries its benefits far and wide. Zeileis has based his method on this basis; he stimulates with powerful electric shocks, which, however, cannot be applied with the same intensity to every patient, but requires variations. And by observing these subtle gradations, we make even further progress without frightening people, perhaps a little slower, but more safely and without the many injuries that are inevitable with such power operations. Nor do we need any radium additives, on which the investigations of real experts are not yet completed.

With our good Violet Neon, and Ultraviolet Energy (but without mercury inserts), and possibly energy in various colours, which still allow valuable colour forces to contribute, we achieve goals that could not be better desired.

In any case, the treatment of the stomach area, and its surroundings is of great value to many: we strengthen the solar plexus, which is often weakened or irritated in modern times. The Yellow electrode can also be used, for about 5 minutes in total, with one day's break per week.

Then, rub in with Settisan, which provides tremendous strength. In addition, the treatment of the kidneys and adrenal glands is valuable; one should Massage the kidney area in the wider area for several minutes 4-5 times a week.

Radiate and spark, exposure only for 10 seconds, maximum 15 seconds, starting with a mild current and gradually increasing to a stronger one. **Never more than 5-6 minutes in total and, if possible, spread over 2 exposures per day.** Through the kidneys and adrenal glands, we exert a beneficial influence, for example, on the eyes and the heart. The interactions of the glands with the internal secretion of vital fluids are, in any case, very significant and require further research.

In Many Conditions, it is Beneficial to treat the Internal Glands as a whole:

One then performs general treatment of the upper brain, the back of the head, the upper chest, the abdomen, and the stomach region (also the testicles in men), as well as the kidneys and surrounding areas, perhaps 4-5 times a week, for a total of 15 minutes, divided between direct treatment and radiotherapy (One can sometimes also work indirectly, which achieves the goal even more quickly). I will designate this treatment, which begins gently and gradually increases, with the Roman Numeral I.

Wherever this I appears, such a treatment should be applied.

If only individual Glandular areas are to be influenced, I place the initial letters thus:

S - Sex Glands (testes in men, ovaries and surrounding areas in women).
L - Liver.
S - Spleen.
K & AG - Kidneys and Adrenal Glands.
P - Pancreas (here the entire stomach and intestinal area is treated).
Thyroid - Thyroid Gland and accessory glands.
Th. - Thymus Gland.

Treatment should always be increased gradually, the most advisable duration being one that allows a certain degree of freedom of movement, so that one's own well-being.

Bladder Diseases of various kinds; Can Be Cured by High-Frequency Therapy.

Our experiences are not only very good, but also numerous, and many doctors who have followed our suggestions have been able to confirm this.

In cases of Bladder Inflammation, the treatment can be performed from the rectum, and from the urethra. There are cases where the urethra is too sensitive for the insertion of the urethra, and then rectal (anal) treatment is performed.

Prof. Dr med. reported that in one case where blood particles were passed with the urine, this had already improved after the first treatment and disappeared completely after the second.

Here, too, it had only improved from the beginning.

He initially gave 7-minute treatments, then one after the other day.

If necessary, treatments can also be given twice a day, but we then spend less time; a few 3-4 minutes are sufficient each time, but I gradually increase the current from medium to strong.

Like Prof. E., we have also been able to determine that urine almost always leads to rapid clarification, treatment was successful.

In fresh, inflamed cases, treatment from the anus is preferable; if necessary, the irritating neon ejaculation can be carefully administered from the urethra.

In old, chronic cases, alternate between the urethra and the anus.

In women, treatment is through the vagina.

Local treatment over the bladder is often very good; I also attach great importance to double-pole treatment from the front and back, and instead of these, the indirect treatment can be used at various locations.

Radiotherapy of the surrounding areas, intestinal relief, and Settisan rubbing also complement the treatment.

In cases of weakened bladder and involuntary urination, treatment is by strengthening of the lower back with application and rubbing, then the bladder area with applied surface ejaculation, better still, sometimes with amplified ejaculation, the bladder neck itself from the anus, and in cases of nervous irritation in the bladder area and in the urethra, ejaculation can also be performed from the urethra itself. One uses the relevant suction of the ejaculation, which is then well lubricated, and one will usually quickly be pleased with a good result.

Urethral and vaginal discharges find their conqueror in High Frequency.

Anyone who has seen it, what a skinful treatment in these areas, complains doubly that the German people have been forbidden from educating themselves about this subject by ill-considered legislation that serves the interests of a clique rather than the well-being of the masses.

A supporter of our cause experienced the following: A young police officer, comes to him in agitation, claiming that he has been infected, and through no fault of his own; he has used a tracksuit that he has hanging around among them and has thus **caught the Gonorrhoea. The doctor helps him with High Frequency.**

The discharge increases at first, but the pain disappears, and in a few days the young man is completely healthy. He said: Many of my comrades have been ill for such a long time, they can't be helped with injections; he's been in the hospital for almost a year and has completely deteriorated.

Now he asks quite innocently whether he can also send his friend to this wonderful treatment.

How do we treat this discharge?

We first shake up the old, clogged discharge with the Violet Hair Tube, and treat the fresh discharge.

As soon as possible, we treat with the anti-irritant and anti-inflammatory Neon Electrode, both can also be used alternately, first soothing and warming, then shaking with Violet Electrode, and then again with a longer Neon Electrode application.

After such treatment, we also rub the penis, and its surroundings thoroughly with Settisan, which brings new strength to the irritated nerve areas.

We also treat the penis externally with Violet Electrode if internal treatment is not yet permitted.

Furthermore, we should pay attention to Draining Intestinal, Leg, and Foot Treatments.

It should be noted that the Clogged Intestines (Constipation), exert a severe pressure on the genitals beneath them, and the blood that does not reach the legs, and feet remains trapped in the abdominal cavity and overheats it.

What has been said here about the discharge of men also applies to that of the female sex, which has taken on very alarming forms in both city and country and causes more devastation than one might imagine.

These discharges, and their incorrect treatment consume our best energies.

With Medical Trade Treatment: The Disease Is Driven Deep Into The Body, And A Host of Abdominal Inflammations Is Bred, Which Destroys Thousands of Women and Girls.

Our experience teaches us that: High Frequency Currents Protect, and that They Provide Miraculous Relief for Diseases of the Entire Uterine Cavity.

The Currents Penetrate Deep Into The Tissue, and Influence the Diseased Abdomen, in a way that Astonishes Every Doctor who has never tried such a thing.

The appendages of the organs affected by the inflammatory process of the discharge, can also be Beneficially Influenced, Dissolving Adhesions, and Producing Many More Miracles.

Parametric Pains, that “Medical Trade Specialists” couldn't cure, gave way to Brief Practical Treatment.

White Discharge (changes in the consistency, and smell of white discharge can indicate either a yeast infection or bacterial vaginosis), which affects over 80% of women, and the Malignant Gonorrhoea Can Be Treated Effectively with High Frequency, which is what the special Electrode is for.

Dr Hans Bauer, MD confirms the experiences of us, and our doctors that brilliant results are achieved with this procedure.

With White Discharge, the first session usually brings a pleasing reduction in the discharge, which then, in most cases, Disappears Completely After a Few further Treatments.

Patients who had previously been treated with all possible remedies, rinses, etc., and usually for a longer period of time, are delighted with the rapid, positive treatment. In both fresh and chronic cases. **You can see the same thing with Gonorrhoea.** Treatment with White Discharge, and Gonorrhoea lasts about 1 month; treatment is given 3-4 times a week. Usually, treatment with the Electrode through the external cervix is sufficient. Some doctors also recommend irradiating the uterine cavity with High-Frequency Current for catarrh that has penetrated through the internal cervix." - Prof. Ewald Paul, in "Advances in High-Frequency Therapy and New Treatment Guidelines", 1930.

Editor Note: This Book (Fortschritte Der Hochfrequenz Therapie, nebst neuen Behandlungs-Vorschriften, 1930), is in the German language, and it needs to be fully translated by a native German speaker. This book, along with all the therapeutic-hygienic books published by Prof. Carl Wilhelm Ewald Paul, are of an immense value in the field of Electro-Therapeutics. This book, also contains a Long List, with the Indication and Method of Treatment of Many Health Conditions which have been successfully treated by High-Frequency Therapy.

The Nature of High-Frequency Currents And Their Therapeutic Use

"In the Healing of Skin Diseases, Weakness, and Discomfort Disappear.
In addition to certain skin diseases and mucous membrane disorders, which is suitable for High-Frequency Treatment, with particular attention to the broad field of Nervous System Diseases, where this treatment method is particularly promising.

Regarding the Indications for Nervous Diseases:

It is to be used as a soothing agent for superficial skin irritations, itching, Paresthesias (a burning or prickling sensation that is usually felt in the hands, arms, legs, or feet, can occur in any part of the body, the sensation happens without warning, usually painless and described as tingling or numbness, skin crawling, or itching), neuralgia-like pain, skin hyperesthesia, etc.

The procedure is to apply the electrode firmly or lift it only slightly, so that only a warming effect or, at most, a very slight sensory heating irritation can be felt.

For neuralgic and similar pains originating from deeper nerves, stronger irritation with spark transfer can be applied in the area of the affected nerve trunks or the associated main parts.

The treatment is very appropriate for all Vasomotor Neuroses, although moderate skin irritation may result. This, combined with the generated warmth, often has a regulating effect on peripheral circulation and thus also provides subjective relief. Migraines should also be mentioned here." - Prof. Ludwig Mann, Broslau, in "Deutsche Meilizinische Wochenschrift", 3 April 1925.

Electro-Osmosis

Electro-osmosis or electro-endosmosis; is the motion of liquid induced by an applied potential across a porous material, capillary tube, membrane, microchannel, or any other fluid conduit.

"Electro-osmotic power, as the capacity exclusively peculiar to high frequency currents, which forces all soluble and dialysable bodies brought into contact with the tissues by osmosis.

Electro-osmosis is the therapeutic utilization of this capacity.

Electro-osmosis must not be confused with electrophoresis or with drug electrolysis; it is a physical penetration by osmosis without any activity of ions.

The amount of material absorption by electro-osmosis is equal to 5 or 6 times that of iontophoresis.

Electro-osmosis allows the material to penetrate as a whole without breaking it down, which is of great advantage.

Electro-osmesis can only be obtained under definite conditions of technic.

One must absolutely impose by 2 proper apparatus a completely cold current, in contradistinction to the diathermy apparatus whose resonator produces a hot spark of small faradization.

Slight faradization, however, is favourable and ought to act in common with the cold effluve.

If applied under other conditions, Electro-osmosis cannot but be either insignificant or dangerous, in conformity to the amperage.

Furthermore, in order to practice Electro-osmosis under best conditions, one must be able to regulate the voltage, amperage and frequency of the current, whence the necessity ensues to have three switching handles independent of one another on the apparatus.

The procedure is always to be carried out under contact, i. e., the electrode must be in intimate contact with the region to be treated during the flow of the current.

The material is introduced into the electrode cavity or in solution by a cotton plug or is spread on the wound in paste, whereupon the electrode is put on the paste.

Electro-Osmosis Is Indicated In:

Odontology, and Stomatology; in case of Rigg's Disease, Hyperaesthesia of tooth enamel, Periodontitis; it is the best procedure for anesthetizing gums and pulp. In Otorhinolaryngology, in case of chronic suppuration of the attic, papillomata of nose or larynx as well as for anesthesia before cauterization by galvanocautery or electrocoagulation; in ophthalmology in case of difficulty anaesthesias; **in gynaecology for prompt cure of vaginitis and cervicitis;** in dermatology in case of stubborn Eczemas and, provided that good antiseptic and soothing remedies are used, in painful dermatoses.

Lupus Tuberculosis Is Substantially Improved by Electro-Osmosis, with guiacol solutions, particularly when combined with Finsen-Therapy.

Beginning roentgen dermatitis, too, seems not to recur after treatment by Electro-osmosis.

All infiltrated parts must first be cauterized by means of Diathermy coagulation.

When most of the cells with large nuclei are destroyed, the whole surface of the wound is electro-osmisized.

This entails a regeneration process.

Especially in surgery atonic wounds are subjected to electro-osmotic Treatment by feeble antiseptic solutions." - Dr Louis C. Barail, MD, DDS, Professor of Electroradiology at the School of Dental Surgery and Stomatology, Paris, in Electroosmosis and its medical appliance, "Elektroosmose Und Ihre Medizinische Anwendung", Neue Medizinische Welt, April 1929.

Therapeutic Important Notes

During Colour Light Cure, with either Electric Light Appliances, or with the Sun, it is necessary to protect the Eyes of the Clinician and the Patient.

Also note that both the Mind and Body Need Rest (both the patient and the clinical must be with the right Mental Attitude during the application of treatment), and both, be at rest before treatment begins, this is also of fundamental importance, if one wants to have a successful outcome in the treatment.

Light, is to be Applied as Either:

1. General Irradiation.
2. Local irradiation.

Incandescent Lamps, Carbon Arc Lamps, Mercury Arc Lamps, Artificial Sunlamps, and Quartz Lamps are normally used.

The correct distance from the light source is also important.

In the Therapy with Colours, Coloured Glass Panes have an Excellent Effect.

The surrounding environment, and the use of Colours in furnishings, such as; colours of walls, ceilings, furniture, carpets, flowers, and all other furnishings, also has an effect upon the person.

The Cultures of Radiating Sand-Packed Bions

> *Reich used sand, heating it to incandescence then plunging it into a liquid culture medium. Bions were again produced, but this time much larger and less motile. He called these SAPA (sand packet) bions. He saw a very bright field around these bions which made him think they might be emitting radiation.* ***These Radiating Sand-Packed Bions (SAPA) were also found to kill cancer cells.***

"**If the radiation in question were directly connected with solar energy**, then many phenomena could be easily explained; e.g., the irritation of the eyes, the conjunctivitis, the rapid reddening of the skin, and its subsequent tanning.

I had conducted the experiments during the winter and early spring of 1939, had not been exposed to the sun, yet had a deep tan over my entire body.

I felt extremely vigorous, as "strong as a bear", and vegetatively alive in every respect.

Gradually, the fear of dangerous effects from the radiation disappeared, and I began to work with it without any further worry about protective measures.

There was no doubt of The Existence of an Energy Possessing Extraordinarily High Biological Activity.

It remained only to discover what its nature was, and how it could be measured." - Dr Wilhelm Reich, MD, in "The Cancer Biopathy", 1948.

"I am writing just briefly to let you know that the strange and contradictory phenomena at the static (leaf) electroscope are gradually starting to become understandable. **Our Mysterious "something" does not appear to be ordinary Electricity or ordinary Magnetism.**

But it influences matter in such a way that phenomena resembling magnetism and electricity manifest themselves at the electroscope.

Let me give you some verified observations:

1. Metals that have been influenced by the "something" (let us provisionally call it "orgonicity") attract the north pole of very sensitive magnetic needles.

2. Materials that are otherwise used to provide electrical insulation, such as rubber (gloves), hard rubber, glass, etc., are influenced in such a way that the leaves of the electroscope move even when the objects are held far away from them, and in certain positions this material attracts the leaves.

3. Using orgonized rubber, it is possible to charge the electroscope by slowly moving the rubber close to and then away from the instrument (repeating this procedure frequently).

4. In the presence of the orgone effect, an electrically charged electroscope slowly loses its charge.

The arrangement is as follows: electroscope plate I — SAPA culture dish — electroscope plate II, which has first been rubbed.

Once the electrical charge has become discharged, the charge deflection caused by the orgone is apparent when plate II is removed.

5. The electroscope can be alternately charged with Electricity and Orgonicity.

Orgone weakens the Electrical charge and vice versa." - Dr Wilhelm Reich, MD, in "Letter to W.F. Bon", 17 March 1939.

> ***"I am well aware of the fact that the human race has known about the existence of a universal energy related to life for many ages. However, the basic task of natural science consisted of making this energy usable. This is the sole difference between my work and all preceding knowledge."*** *- Dr Wilhelm Reich, MD, in "The New American Medicine", Journal of The Mindshift Institute, 8 December 2002.*

Correction of Colour Vision

The author has trained over 100 cases of patients unable to differentiate colours and has been one of the most successful in this field.

"Considerable interest has been shown during the past year in so-called "Colour Blindness."

This term seems to be misleading because there are very few who are really colour-blind. On the other hand, there are millions who are deficient in colour perception to a more or less degree. My experience in correction of this deficiency has been very gratifying and through proper training a very large number have been rehabilitated and accepted in the aviation corps who had been rejected due to poor colour perception.

The procedure is very simple and easily applied:

1. Step - We start with ten minutes of rotary training using displacing prisms creating a vertical diplopia. This training can be given on any instrument having a rotary action.

2. Step - 10 minutes exposure to the combination of colour represented by the Alpha and Delta filters of Spitler's Amblyo-Syntonizer. This is given on a slow flash (three second interval.)

3. Step - 15 minutes exposure to the Alpha plus Theta filters on slow flash.

4. Step - (not necessary in most cases) Mu (the "Mu Upsilon" filter is a combination used in syntonic phototherapy, a type of light therapy for vision problems and other conditions) combined with Upsilon filter to eliminate after images if the patient is bothered therewith.

This requires only 1 or 2 of steady exposure.

For those who do not have the above instrument the Alpha filter is a bright red (not ruby red), and the Delta filter is a colour between amber and orange, more orange than amber. Theta filter is a light yellow amber in colour.

Upsilon is a light bright Blue, and Mu, light bright Green.

The combination of these 2 filters produces a bluish-Green.

The light source is a 50-watt bulb, 105-volt for 120-volt circuit and both light and filters are used behind a frosted diffusion lens.

The average time required to complete correction is about 10 days.

I have completed some cases in 5 days, but those are the exception.

These are based on 1 training period per day.

Progress will first be noted in the inability of the patient to see charts which the colour-blind normally see.

As we continue training the patient will begin to see the normal charts.

I have often been asked if, after training is completed, normal colour-vision is maintained. I can only answer this by saying that so far as I know by checking on completed cases, they do maintain the efficiency developed and some cases improve after training has been discontinued." - in "The Mid-West Optometric Journal", November 1942.

Syntonic Phototherapy

> ***"Syntonic Phototherapy is a simple, non-invasive Light Therapy treatment that has been around for more than 70 years.***
>
> ***Syntonic Phototherapy uses specific light colours, frequencies and wavelengths to improve the body's regulatory centers in the brain.***
>
> ***When Light enters the eye, it travels through the brain to the Pineal Gland and the hypothalamus; the areas of the brain responsible for chemical and hormone balance."*** - *in "What Is Syntonic Phototherapy?", Optometrists Network, 2025.*

> ***"The Pineal System is the coordinating and integrating system of the body.***
>
> ***At the highest level; The Pineal System Co-ordinates and Integrates Spiritual and Mental activity with the Physical Body. It Is The Body-Soul Connection.***
>
> ***The pineal/Leydig gland axis is its core, which is called the "seat of the soul"." - David McMillin, MA, in "The Treatment of Epilepsy", 2019.***

Chapter 6

Light And Colours Therapeutic-Hygienic Studies

> ***"Empirical Hydrotherapy: so widespread in Greece, and especially in Imperial Rome, advocated by Pythagoras, Hippocrates, Celsus, and Galen, was given scientific therapeutic application by Vincenzo Priesnitz from 1829 onward.***
> ***Heliotherapy, so useful for stimulating physiological energies and reactivating the processes of assimilation and tissue renewal, has been successfully used in modern times for various forms of surgical tuberculosis and tubercular peritonitis.***
> ***Dr Sciascia from Canicatti (Girgenti) was the first to discover, in 1890, an instrument he called a "Photocautery", which, by modifying and calibrating sunlight, was able to cure certain diseases. He was the first to present his new treatment method on 14 April 1892, at the 13 Congress of the Italian Ophthalmological Association in Palermo.***
> ***Phototherapy: In 1894, at the National Medical Congress in Rome, he presented his paper "Phototherapy in Medicine and Surgery", several years before 1897, the year in which Finsen of Copenhagen first recommended the use of Phototherapy in the Treatment of Lupus. Therefore, the discovery of Phototherapy, now so widespread, is due to a Sicilian physician, not to Finsen, to whom it is erroneously attributed.***
> ***The various electrical manifestations applied with scientific gradation and measurement represent a thoroughly modern therapeutic aid, since Volta's battery, the pioneer of Electricity, was discovered in 1800.***
> ***Static Electricity: was first applied, of which John-Wesley was the main proponent. Then, galvanic current was used in therapy, and induced current, discovered in 1831 by Faraday, was widely used in medicine, first by Neef of Frankfurt.***
> ***And quite recently, thanks to the work of Arsonval-Thomson, notable therapeutic successes have been achieved with high-frequency currents, and with the studies of Mortoti and Merchell with sinusoidal currents."*** *- in "Compendio di Storia della Medicina", 1922.*

"In the Light and the Colours that arise from it; Enormous Powers Slumber, unimagined by the masses, even by our educated people.

Science has now begun to harness these powers for the general welfare.

Certainly, there have been few times in which such help was more needed than today, when the mighty battle of the wolf has profoundly affected the strength of humanity.

> ***"Light is the Cheapest and Most Effective Means of Destroying Disease."*** *- said a great physician.*

Recently, some of our medical staff, reported that they **were able to achieve brilliant Cures for Smallpox with Red Light, without disfiguring scars**, and Medical Councilor Dr O. Müller confirms this in the Munich Medical Weekly, 13 March 1917, and at the same time **presents his Remarkable Healing Successes in Treating Erysipelas, also Achieved with Red Light Irradiation.**

Incidentally, the distinguished Light and Colour researcher Dr Karl Wachtelborn also commemorates it in his work "Medicine on an Energetic Basis and the Law of Epidemics".

This book presents a great deal of hygienic knowledge, and is widely used by physicians in Jarbendingen.

And other experts from the Munich Society for Light Research, praised it for this reason.

"There must be a Mysterious Power in Red Light", writes Dr K. Sandrowski, a Light Therapist for 20 years, and ardent supporters of Light Research Society, **can tell of wonderful treatments with alternating irradiation of Blue, and Red Light.**

He **Heals Heart Neuroses with Light, and also Treats the After-Effects of Appendicitis.**

Medical Councilor Dr Breiger **presented a study on the Miraculous Effects of Light on Tuberculosis.**

Dr Breiger works in a similar way, has Dr Backer at his health resort Klinik in Riezlern (Allgau).

His work on **Open Air Sun Treatment for Bone, Joint, and Soft-Tissue Tuberculosis, is a truly classic work.**

And so, many more successes can be demonstrated, the disclosure of which is a duty to our people, as it shows them the ways to preserve threatened and build new strengths.

Above all, our leading circles can be served by summarizing the experiences of practitioners, and **the possibility of New Therapeutic, and Hygienic Measures can be opened up to our people.**

How many amputations would have been spared, how many flourishing human lives would have been saved, if certain hospital trains had been equipped with Light Therapy compartments, as Dr Sandrowski suggested.

How many thousands of our fighters out there would have been saved from serious physical injuries, from early death, if outpatient light therapy centers (powered light vehicles combined with Döcker barracks), had been brought to them, according to Dr Heusner's suggestion!

And how much blessing would have been offered by the Colourful design of those rooms in which our field grays, who have suffered from Nervous and Mental Illnesses due to war, are kept!

They, who are behind Chalk-Grey walls, despite all other care, recovered only slowly, and see themselves and their homeland deprived of precious time in their lives. **They would, in a colourful environment (as our experts experiments prove), Recover Quickly, and Recover in Body and Soul.**

From this perspective this present work was written; drawing on the experiences of prominent Light Researchers and physicians, and striving to transfer their findings to wider practice.

Should this Book succeed in opening up new Hygienic-Therapeutic Paths for Humanity, the author's wish will be fulfilled.

More than 30 years ago, I published a work on “The Healing Power of the Sun”.

It contained various suggestions that were intended to serve Science.

My research later led me to Italy, where I was able to study the Healing Powers of Light and Colours even more thoroughly.

I joined the ranks of the great Sun Doctor, **Dr Antonino Sciascia, MD, in Catania, who, in his seclusion in the interior of Sicily, performed miraculous cures on the peasants of his country.**

When I met with the leading minds of Italian Medicine, at the Hygiene Congress in Rome, I referred them to this great man, who was Niels Finsen forerunner, and succeeded in having him awarded some of the honours reserved only for Finsen (the Nobel Prize in Physiology or Medicine, 1903, was awarded to Niels Finsen “in recognition of his contribution to the treatment of diseases, especially Lupus Vulgaris, with concentrated light radiation, whereby he has opened a new avenue for medical science”).

I wanted to help pay off the debt of gratitude to a man, who worked selflessly for humanity and science, far removed from all cultural activity, and who also encouraged me to persevere on the path of light research.

Dr Sciascia demonstrated the powers of light in himself.

Standing tall in his 70's, he was still young, of a fine figure, without wrinkles, young in body and soul, full of that youthful enthusiasm that had distinguished him 50 years earlier.

The Medical Journal “Pensiero Sanitario”, describes him:

> *“Light was his Rejuvenator. That mighty radiance that fills the universe and speaks to us in the spirit of its geniuses.*
>
> *Like Michelet, he thought that* ***of all flowers, the human flower is the one that most needs the sun, and he wanted to use the sun for the benefit of the sick.***
>
> ***He also used it by condensing the rays and using his photocautery, a light-etching device, for localized illnesses, so that the light, as it flows to the diseased body tissues, would revive the body's defenses and destroy the pathogens through its antiseptic powers.*** *His first studies were presented to the Ophthalmology Congress in Palermo in 1892, on the Treatment of Trachoma (bacterial infection in the eyes) with Light Therapy.“*

Many Eye Patients, owed their Healing to this New Procedure.

Soon thereafter, he studied the effects of the various colours that arise from light, thus providing many physicians with the basis for important therapeutic successes. And tirelessly continued his work on: The Influence of Light on Various Diseases; Light Can Penetrate the Tissues of the human Body.

Using his invention Photocautery, he had splendid Success in Treating:

1. **Bruises.**
2. **Favus (skin condition).**
3. **Lupus.**
4. **Tuberculous Chest Fistulas.**
5. **Tuberculous Peritonitis.**
6. **Erysipelas (superficial infection affecting the upper layers of the skin).**

Dr Finsen, who used artificial light, and achieved good results with it, achieved without being able to achieve the cures and experiences of Dr Sciascia. But he achieved that fame, and fortune that was denied to the Sicilian explorer. The same happen to other champions of Light Cures, as Arnold Rikli, founder of Atmospheric Therapy, establishing the Natural Healing Institute for Atmospheric Therapeutics, **emphasising - The Power of Natures Healing Elements:**

1. **Sunlight.**
2. **Fresh Air.**
3. **Clean Water.**
4. **Physical Movement.**
5. **Nutrition.**

Arnold Rikli whose Sun Cures blessed thousands, of seriously ill patients and attracted enlightened physicians from far and wide; the master in the handling of solar forces, who knew how to dose them like few others!

A Maximilian Mehl (in 1889, a chance observation in Berlin, lead him to develop a new method of treating Lupus Vulgaris; with concentrated Sunlight), cured hundreds, upon hundreds of Severe Lupus patients, thanks to Light Irradiation in the simplest way imaginable, using a magnifying glass, and who astonished our professors with his treatments, who willingly referred their patients to him because they placed unlimited trust in Mehl's healing abilities, and for whom the Prussian State Government even established his own Healing Institute.

Finsen's study “On the use of concentrated chemical light beams in Medicine” (Om Anvendelse i Medicinen af koncentrerede kemiske Lysstraale), 1899, on the significance of the Electromagnetic Ion Cyclotron (EMIC) rays of light, and with this study, he was hailed as the inventor of Phototherapy.

However, he experimented with the effects of concentrated EMIC rays (Dr Sciascia's method), 7 years after the latter's discoveries.

Finsen knew that a humble Sicilian physician living in solitude was the true creator of Phototherapy, and he confessed to Professor Cirincione, who was visiting Berlin, that the credit for the discovery of the concentration of Solar, and artificial light rays belonged to Dr Sciascia. In 1902, Dr Sciascia published his work on Light Therapy "La Fototerapia", Rome.

"Phototherapy: A considerable literature is accumulating on this interesting branch of therapeutics, the most recent contribution to which that has come to our notice in a small book by Dr Antonino Sciascia, MD.

Dr Sciascia has invented a light condenser which he calls a Fotocauterio.

This he describes and figures. Also gives some preliminary matter pertaining to the general subject of **The Therapeutical Use of Light.**

But by far the greater portion of the book is taken up with accounts of cases in which he has made use of the Light Treatment.

The morbid conditions represented in his cases are rather numerous.

They include:

1. **Malignant Pustule (4 cases).**
2. **Facial Erysipelas.**
3. **Chronic non-febrile periodical erysipelas (crisipcia cronica periodica afebbrile).**
4. **Lupus Vulgaris (2 cases).**
5. **Tuberculous Peritonitis.**
6. **Orrhymenitis.**
7. **Tuberculogummatous Lymphangeitis.**
8. **Tuberculous Polyadenitis.**
9. **Chronic Pulmonary Tuberculosis.**
10. **Descending Diphtheritic Croup.**
11. **Whooping-cough (2 cases).**
12. **Lobar Pneumonia.**
13. **Typhoid Fever.**
14. **Puerperal Metritis.**
15. **Gastric Ulceration with Hyperchlorhydria.**
16. **Blennorrhagic Arthritis.**
17. **Chorea Minor.**
18. **Epilepsy.**
19. **Cataleptic Hysteria.**
20. **Acquired Deaf-mutism.**
21. **Hysterical Dysphagia.**
22. **Peritonism.**
23. **Tic Douloureux.**
24. **Sciatica with Exophthalmic Goitre.**
25. **Epithelioma (4 cases).**

As regards Malignant Pustule (necrotic lesion surrounded by blisters and edema), not only was **a cure effected in each of the 4 instances** recorded, but in all, has treated 28 cases, more or less grave, since 1890, and with invariable success.

Besides the **2 cases of Lupus here reported as cured, he has treated 14 others with the most brilliant results.**

In the case of Orrhynicnitis, in a young woman, there was effusion into the pleural, the pericardial, and the peritoneal cavities, and the disease had lasted for 40 days. The pleural effusion is said to have occupied 2/3 of the thoracic cavity.

The patient had Fever, her Nutrition was impaired, and she was Anaemic.

15 Applications of Condensed Light over the thorax and abdomen, each lasting 1 hour, and the treatment applied every other day, **produced a complete cure.**

In the case of Pulmonary Tuberculous disease, the duration was only 2 months and the physical signs were not positive, but the tuberculin test evoked a **decided reaction.** At the end of 40 days the symptoms began to subside, and 20 subsequent applications were **followed by a definitive cure.**

7 years have elapsed without a return of the manifestations.

The author thinks that like results may be expected in the pre-tuberculous stage, but that after that the treatment can only strengthen the natural forces, rendering the evolution less complicated and diminishing the likelihood of spreading the disease.

The patient with Ulcer of the Stomach was somewhat benefited, but the treatment was not followed to a cure.

In most if not all of the other histories recorded by Dr Sciascia **either Recovery or Decided Improvement Followed the Employment of Phototherapy."** - in "Phototherapy", New York Medical Journal, 11 October 1902.

More than 20 years ago, Dr Sciascia recommended the Sun Cure for bone Tuberculosis, and related cases.

Today, Sanatoriums have been established for this purpose, which bring great benefits and even permanent cures to such patients.

We refer here to Dr Backer's magnificent Spa in the Bavarian Allgäu, and to that of Dr Rollier-Leysin on Lake Geneva, among others.

Dr Sciascia was **the first to demonstrate that Light, in addition to its specific effect on the external components of the body, also triggers photocatalysis in the deeper organs, and body cavities.**

There, it brings about systematic physiological and biological activity.

How Light & Colour Therapy Achieve Its Effects

Through its Chemical-Thermal, Electric-Magnetic, Oxidizing, Antitoxic and Anti-Bactericidal, action. The Rays of Light, can Stimulate the Innermost Life, and Promote Metabolism.

"The Privileges of Radiant Energy are Tremendous:

1. **Chemical-Thermal.**
2. **Electro-Magnetic.**
3. **Oxidizing.**
4. **Anti-Inflammatory / Anti-Toxic.**
5. **Bactericidal.**

The Light Rays Stimulate the Innermost Life, Promote Metabolism, Accelerate the Exchange of Fluids through the Vascular Walls, and Promote the Accelerated Excretion of Carbonic Acid, and Greater Absorption of Oxygen.

Light Therapy also Helps us with the most serious internal ailments, the Excretion of Bacteria, and other Toxins, and the reduction of pathological blood pressure in the deeper organs, etc."

German science did not remain idle. Thousands of zealous physicians, inspired by earlier researchers, or by their own inner impulses, embarked on the new Therapeutic path and enjoyed unimagined successes.

At that time, I was experimenting with some Italian doctors on: **The Effects of Light on Typhus, various Venereal Diseases, and various Abdominal Disorders, and we were pleased with the Therapeutic Results.**

Varicose Ulcers

One evening, in Venice at the time, I was called to visit a neighbour, a woman in her late 60's, who was suffering from Varicose Veins, as the local doctor, who was a friend of mine, happened to be away.

After the usual treatment, I decided, in agreement with the doctor in question, the following day to use the Light Treatment on the Varicose Ulcers that were also present.

I had received the suggestion from a German physician, Dr Otterbein, **who had cured many Varicose Ulcers in this way.**

And **we were also successful, and saw the disorders disappear and the blood vessels smooth out within a short time.**

Some clinicians in neighbouring Padua even had the case demonstrated.

I would like to Emphasize that I recognized the Combination with Moving Air, as a Special Benefit of many Light Treatments.

Rikli, Dr Backer, Dr Heuser, **and many others were also aware of this.**

Therefore, **the confinement of patients in wooden, glass, and other boxes during irradiation is not always beneficial.**

This is also emphasized by an experienced supporter of our cause, a General Surgeon in the Prussian Army, who **achieved remarkable results in practice, and by moving the light source closer or further away, by placing white and coloured glass walls, the treatments are to be regulated accordingly.**

In this sense, some experts from our "Society of Light Researchers", also worked through experiments with a Coloured Glass Bath, with Vibrating Light, with their plans for coloured light showers, and rotating light sources, the latter in addition to the suggestions given by our corresponding member, the American physician and light researcher Dr Schmit.

Some work has already come very close to practical application.

A special eye shot in the increased light flood of sunbathing and related baths and irradiations also seemed important to us. Eyes and Mind require rest.

It is certainly not necessary to cover all those areas here, human ailments for which Light Therapy offers help, and indeed mostly surprisingly quick relief.

Nevertheless, a submission addressed by the light researcher Dr K. Sandrowski, MD, to the Society for Light Research may be included here:

Light Triggers Life Processes

"With reference to our discussion at the last meeting of the "Society for Light Research", I have the honour to emphasize once again that: **I have 20 years of Experience in the field of Light Therapy.**

I am gladly prepared to serve your good cause for the benefit of our brave army, and the general public. **The extremely satisfactory, in some cases unprecedented, successes of Phototherapy** entitle me not to doubt for a moment that you will earn the gratitude of the fatherland with your efforts.

The damages of the war, which it inevitably brings with it, can be repaired, the military strength can be regenerated, and invaluable human resources from the ranks of the war-disabled can be returned to the army if the successes of this therapy are brought to the attention of the relevant authorities as widely as possible.

Based on My Experience, I Classify Phototherapy as Follows:

1. Pure Helio-Therapy.
2. Artificial Sun Therapy.
3. Chromo-Therapy.

The Effect of Helio-Therapy is mainly from:

1. Blue.
2. Green.
3. Red.
4. Infrared.
5. Purple.
6. Violet.
7. Ultraviolet rays.

Light Triggers: "Life Processes" in the cells of our body, with which one can influence (i.e. increase or decrease) Health and Life Energy.

I consider Helio-Therapy, with its intensive effect, to be the most ideal form of application, simply because it has proven itself to be the victorious conqueror of the most terrible enemy of mankind, the Tubercle Bacillus.

The various forms of Bone and Joint Tuberculosis, which repeatedly recur despite surgical interventions. Tuberculosis of the soft tissues, with its seemingly incurable fistulas, has, without contradiction, found its master in it.

Its application is largely tied to:

Healing Factors of Eminent Healing Efficacy

Clean Air, High-Altitude Climate, and Location; but its Success with regard to Muscular Strength is of even Greater Significance. We possess Healing Factors of Eminent Healing Efficacy in the other 2 forms, even in the lowlands.

Helio-Therapy

Even here, we do not need to forego pure Helio-Therapy, and can use it, albeit with a lesser effect, as an auxiliary factor wherever we want to achieve:

1. **General Strengthening Effect.**
2. **Increase in Metabolism.**
3. **Increase in Red Blood Cells, and Hemoglobin levels.**

The vast array of Metabolic Diseases:

1. **Diabetes.**
2. **Arthritis.**
3. **Certain forms of Tuberculosis.**
4. **Arteriosclerosis.**
5. **Anaemia.**
6. **Chlorosis.**

Provide suitable targets for this.

Phototherapy

As for the second form of Phototherapy, it was born out of the desire to replace the effectiveness of **Helio-Therapy in its most effective agent: Blue, Violet, and Ultraviolet Rays. The current Quartz Lamps, known under the name "Artificial sunlamps", Have Proven to be a significant Healing Factor. Wherever it is important to achieve localized successes, long-lasting epidermal ablation, peeling and cauterization, etc., they have delivered commendable results.**

Skin Diseases

Many forms of; Skin Diseases, especially:

1. Acne.
2. Eczemas.
3. Alopecia areata and pityriasis.
4. Fistulas.
5. Ulcers.
6. Pruritus.

And the like; fall within their scope.

I have also frequently Achieved Favourable Results in:

1. Cardiac Neuroses.
2. Angina Pectoris.

The greatest field for their confirmation, however, has arisen during the current war period, where they are called upon to alleviate and shorten the suffering of our brave warriors.

Bactericidal Effect of Light

The Bactericidal Effect of their rays quickly sterilizes wounds, and closes them with soft scarring by accelerating the healing process.

The greatest potential, however, lies with the 3rd form of Photo-Therapy, possibly in conjunction with with the first-mentioned: Chromo-Therapy.

Even if the Ultra-Violet Rays, are less intense, we have another factor of considerable importance: Thermo-Therapy.

The often longed-for biological reaction through the appearance of skin pigment, which Finn attributes primarily to ultraviolet rays and which is probably based on the decomposition of the affected tissue cells as a result of protein coagulation, can also be achieved through Chromo-Therapy.

I have found that, for example, in hyperpigmentation, a strong pigmentation of the skin is not always a predictor of healing; indeed, relatively better healing processes have often been observed in less pigmented skin.

Experience has shown that; **the killing of bacteria occurs through the inflammatory tissue reaction caused by the light rays.**

Chromo-Therapy

In Chromo-Therapy, we have all the application forms that can be regulated as desired.

Among its colours, it is Blue and Red light in particular that achieve incredible results.

The Dual Effect of Light & Heat, has proven; Particularly Effective In Relieving:

1. **Appendicitis.**
2. **Peritonitis.**
3. **Tuberculous forms.**
4. **Localized Tuberculosis, especially of the joints, bones and their fistulas.**
5. **Gastric Diseases.**
6. **Intestinal Diseases.**
7. **Gynecological Diseases; among the latter, primarily diseases of the ovaries.**
8. **Metritis (Inflammation of the Uterus).**
9. **Fluor Albus (leukorrhea).**
10. **Cave catarrhal.**
11. **Gallstones.**
12. **Kidney Stones.**
13. **Leg Ulcers.**
14. **Eczema of all kinds.**

Red Light can almost completely prevent the suppuration stage, and its disfiguring scarring in Variola. Likewise, with timely and **Appropriate use of Chromo-Therapy: Diseases such as; Scarlet Fever, and Measles can regularly be positively influenced.** Chromo-Therapy Rooms, can be easily set up due to their simple and inexpensive setup; **they are indispensable in every hospital.**

The Effect of Red and Blue Light on the Psyche is well known:

1. **Red, has an stimulating effect.**
2. **Green, is uplifting.**
3. **Blue, in addition to its pain-relieving properties, has a strong sedative effect.**

A vast field of work is open to Chromo-Therapy, its scope is far from being explored and exhausted.

Let us no longer resist the recognition that: **Man Is A Creature of Light.**" - Dr Karl Sandrowski, MD, 18 February 1917.

In considering these, and other contributions from our medical members, we came to the decision to request something concrete for the army.

Here, Dr Sandrowski, with the approval of the other doctors, **proposed special Light Therapy compartments for certain Hospital Trains.**

Anyone, who knows how many severely wounded patients had to forgo the benefit of a bandage change during their return home, and were therefore handed over to the doctors in the hinterland in a sorry state understands what the proposed Light Therapy compartments would have meant!

Many lives would have been saved, many amputations avoided!

The blessing of thousands would have been assured, and therefore we should have striven with all our might to implement such beneficial measures.

Dr Heusner's proposal, also supported by our Society for Light Research, to send our own light healing centers behind the front, went even further.

Let us hear from Dr H. L. Heusner, MD, in Giessen, and Medical Councilor Dr Breiger, the successful Berlin Light Therapist, considered one of the most important Light Researchers in Germany:

Light As A Therapeutic Agent

"**Light Treatment**, as Dr HL. Heusner writes to us, has attracted the attention of a wide range of people in recent years **due to its surprising Successes in Treating a Wide Variety of Illnesses. We use Light as a Therapeutic Agent, either in the form of general irradiation of the whole body, or locally to irradiate specific disease sites.** Our main source of radiation is the Sun, but since it is only available to us for a relatively short time. Thus, we have learned to use artificial radiation sources for our purposes. **Here sometimes, we have obtained even better healing results than with the Sun, because we can combine them in a way that suits us, in each individual case, and use them for as long as we need.**

These Artificial Radiation Sources Are:

1. **Incandescent Lamps,**
2. **Carbon Arc Lamps, and, above all, the**
3. **Mercury Arc Lamp, which was introduced into our medical system 10 years ago.**

Blue, Violet and Ultraviolet Rays

We achieve Healing Effect With All Rays; But these:

1. **Blue;**
2. **Violet, and especially the**
3. **Ultraviolet Rays (which are invisible to the eye, and lie beyond Violet), are particularly powerful.**

If Ultraviolet Rays of Light affect unhardened skin (the sunlight by the sea is rich in them, in the high mountains, or on clear winter days with fresh snow), after a few hours a sensitive skin inflammation develops, which we know as sunburn or glacier burn.

This inflammation is caused by the cold ultraviolet rays of light.

Among artificial light sources, the Quartz Lamp, and the "Artificial Sun Lamp" created by the Quarzlampen-Gesellschaft GmbH in Hanau, are particularly rich in these rays; they have become an indispensable aid for physicians.

Due to its great abundance of Ultraviolet Rays, it stimulates the most delicate processes in the living cell, the smallest building block of our body.

Red and Green Rays

1. Red Rays.
2. Green Rays.

Also Have Great Healing Power, the same company introduced the Sollux supplementary lamp, which is particularly rich in these.

This is a fluorescent tube that emits a light equivalent to 3,000 candles, like a large arc lamp.

Artificial sunlamps and a Sollux lamp used simultaneously produce a general light bath that is close to the effectiveness of the sun.

Light Treatment in Skin Diseases

Light Treatment today is no longer exclusively relevant for superficial Skin Diseases that are easily accessible to light.

Most Skin Diseases, are cured more quickly with light, than with long and expensive ointment treatments.

The quartz lamp has also always been of great use in treating Hair Diseases.

Scrofula in children, a clinical picture closely related to Tuberculosis; Tuberculosis itself in its many and varied forms.

Tuberculosis of the Bones, Joints, and Glands, but also of the Lungs and other Viscera, is favourably influenced by General Light Baths.

The Healing Ray of Light has secured its place. In many cases, it has taken the knife out of the surgeon's hand; many a medicinal potion and many a pill, become superfluous where it is given Access granted in a timely manner.

Wound Healing Effect of Light

During the war relocations, **the wound-healing effect of light can shorten the sickbed of the wounded by many days, even weeks.**

Nervous Disorders

Even in cases of Nervous Disorders, and Weakness resulting from the Strains of war, recovery and strengthening of the entire body, was brought about in a short time.

With natural and artificial light baths, the overworked can provide themselves with stimulating refreshment.

In this sense, we must learn to make even more use of our Sun.

Air Baths with artificial light are almost as necessary for us as Water Baths.

We can achieve our goal most easily and quickly if we replace the sun with artificial light baths, just as we replaced the river bath with the bathing establishment.

These, as experience has taught us, achieve almost perfect results.

A nerve-refreshing relaxing light bath would also be beneficial in many cases for our field grays.

The relaxing Light Bath would surely soon become an indispensable necessity for a large part of the population, just as the Swimming Pool, or the Cleansing Bath now is.

Especially for the city dweller exhausted by the rush of the day, for those who work mentally or physically, but especially for the worker who lacks the time and means for excursions into sunny surroundings, the artificial light bath, which is available at any time in summer and winter, regardless of the weather, would be of inestimable value as a means of refreshment.

Even the weak child's body can be protected from impending illness, and Made More Resistant to all kinds of Health Damage, by Light Baths.

The great social significance of light baths with artificial radiation sources, which are accessible to the public, is readily understandable.

Not only do we restore to the state a large number of those otherwise permanently afflicted with Tuberculosis, especially those threatened by or already suffering from it, as productive workers, thus potentially saving them a stay in Sanatoriums, hospitals, etc., but **we also Protect the Healthy from various illnesses,** and ensure their continued productivity.

Therefore, we should make much more of the light.

If we give Light the Importance It Deserves, we will always find in it a Reliable Helper to Increase the Strength, and Performance of the Healthy, and to Improve and Heal the Damage, inflicted on the health of our people." - Dr Breiger, MD, Berlin.

Light As A Therapeutic Remedy

We could only agree with these words of an expert, and it was clear that our Society for Light Research, which had set itself such high goals, had to embrace these humanitarian plans.

We welcome Dr H. Heusner, Professor Jesionek's assistant, a Light Researcher from whom the world can expect much.

His work on **"Light as a Healing Agent"** (Das Licht als Heilmittel), which appeared in "Prometheus", 1917, and other scientific journals, has also had a positive impact on broad medical circles.

Biochemical Effect of Light on Living Cells

He spoke on the **Biochemical Effect of Light on Living Cells:**

> ***"Changes are induced in the Cells exposed to Light, which Influence the Vital Processes within them. If a part of the body's cells is stimulated in this way, e.g., those of the skin, not only do changes occur in them, but neighbouring cells are also stimulated via the blood and nerve pathways. This allows us to explain why Light Rays not only affect the affected cells, but; in general*** *sunbathing,* ***the metabolism of the entire body is stimulated, including those organs that, located within the body, are not directly accessible to the Light Rays."*** *- Dr H. Heusner, MD*

Precaution

Light Triggers Life Processes; in the finest building blocks of our body, the regulation of which allows us to exert a powerful influence on health and illness.

In this way, we can (through the supply of Light), Increase or Decrease Life Energy, and cause harm through excessive and one-sided use.

In Light Healing, we know that everything has 2 Sides.

This polarity also applies, and especially, to light.

The great Sun Doctor Rikli knew this, and another practitioner, who, as General Surgeon of the Prussian Army, zealously promoted Light Treatments, expressed a similar view.

The patient's distance from the light source, the type and intensity of the light, and many other factors, such as proper rest, which is actually only emotional regeneration, and appropriate nutrition, all of this works together to bring light treatment to its peak.

Beautiful Light Therapeutic Results can be achieved next to, and behind glass walls, even coloured ones.

That general practitioner tested this, and we ourselves can confirm it.

Great things are being achieved with artificial light sources by some modern practitioners, but this does not prevent them from being misused here and there.

People forget that the actual Light effect is often the best, and they try to achieve great results with large doses.

Jesionek, Heusner, and many others Achieved Miraculous Results With These Therapeutic Remedies.

A lady on Lake Starnberg suffered from Erysipelas (an infection of the superficial layer of the skin).

The Doctor treating her, who knew nothing about Light Therapy, had to be called to duty, and his Deputy immediately used **Artificial Radiation, which Cured the woman in 2 Sessions.**

“The illness must be drawn out quickly”, he said, “otherwise it will drag on.”

How many people could be helped in this way if they could find the right path right away?

Light is more than is commonly believed:

It Is Force, Matter, and Space.

Light Dynamics

That we bathe ourselves in light, anyone can experience the power of recharging oneself with new strength.

Return home from a sunbath feeling spiritually refreshed, and work with greater air quality than before.

The resistance of the German soldiers in Africa to wounds, the surprising healing of even the most serious cases, has already amazed many of our doctors.

The people are saturated with light forces, solar accumulators.

If you take the time to read the Reports from the colonial doctors about this, you will have to believe in Light Miracles.

The light that streams into our bodies affects their substance and motive power.

Anyone who thinks about it without prejudice cannot ignore this realization.

And the exposed areas pass on the forces developed in them through the exposure to the areas that remained in the dark – inward.

The Red and Yellow rays cause blood congestion in the affected organs, “hyperemia”; the Ultraviolet rays, achieve a similar effect by stimulating the gluteal nerves.

However, we should note the difference between the 2 phenomena: the irritation caused by the heat rays appears almost immediately, while that caused by the cold (ultraviolet) rays only appears after hours, even days.

The latter also fades more slowly, while the former disappears more quickly.

This demonstrates a tremendous difference in power between these, and those rays.

The Faster-Oscillating Ultraviolet Rays Are Absorbed More Strongly; they thus give the body's cells a more powerful impulse, and thus Have a Stronger Healing Effect.

The Red and other heat rays, on the other hand, will drive the Life Juices (The Lymph and Blood), more quickly through the body, but this alone is not enough.

The preparatory work must be done by the Ultraviolet Light Forces, by putting the cells into a more receptive state, and adapting their internal metabolism to the new Blood Life. Thus, better Treatments will be achieved with Mixed Light, than with the exclusive use of one type of light.

Every practitioner confirms this; such as Dr Sandrowski in his successful Goiter Treatments, which he achieved by alternating Red and Blue Irradiation, and many others.

Greater Blood Flow increases the sensitivity of the cells that make up the body.

Through light, we also influence the blood and allow the antibodies (antigens) that form in it to reach the area where the body is threatened more quickly.

Light brings about an increase in metabolism, and an increase in the amount of energy and defences in the blood.

Knowing this is especially necessary in order to be able to use light; as a wound healer.

The Wound Healing Process Is Magnificently Influenced by Light Irradiation

> ***"The previously seemingly dead tissue awakens to new life, under the influence of the light beam. And the faster the beam oscillations occur, the more intense the stimulus the cell particles experience. Initially, when the vital activity of the cells is still completely suppressed as a result of the damage suffered, where it can only react sluggishly, rapid and sudden bursts of short-wave (Ultraviolet) Rays are needed to awaken them to new life. Later, slower vibrations, Red Rays, Promote Further Healing Processes in a milder way."*** *- Dr Heusner*

How little people today know about the effects of light is demonstrated by the fact that so many fall victim to Strokes year after year, while it would be a small matter to avoid this danger.

Orange-Yellow neck scarves, hat and helmet linings of the same colour would make a splendid impression.

Have you already thought about protecting yourself from harmful light rays when staying in southern regions?

To preserve it, an officer in the tropics had tested this simple method and had his helmet covered with such a snare. His friends laughed about it, considered his idea "suggestion", secretly removed the snare, and (lo and behold), the man had quickly healed his helmet damage. And couldn't we also adopt similar snare measures at home during the summer for young and old?

Dr A. Krüche, the editor of the "Ärztliche Rundschau", tireless champion of light knowledge, and the utilization of light forces for the well-being of our people, also joins us.

Colours Are Transformed Light Forces

We have now considered the Effects of Coloured Light, and pointed out its use for Hygienic and Therapeutic purposes:

"Colours Are Transformed Light Forces, Stored Solar Energies." And with these words, they have become more widely understood as sources of strength and healing. Only the simplest observations are needed, to understand the Health Effects and Healing Powers of Colours.

I referred on the outrageous fact that our warriors, thrown off their mental balance by the shocks of battle, are kept in chalk-gray walls behind barred windows, instead of being raised in **Colourful Surroundings and led to faster healing.**

Hundreds of thousands could be restored to health, and thus fitness for service in often surprisingly short times through rational Chromo-Therapy.

How much more can still be observed in matters of Colour Power is shown to us by a wealth of further suggestions from our members.

An expert points us to the fact that in Holland, skylights made of coloured glass are commonplace and usually larger than ours.

These almost always square skylights, **in which Yellow is particularly popular, have an incredibly beneficial effect on the residents, and are likely a contributing factor to the extraordinary nervous strength of the Dutch.**

This became clear to me since the moment I became acquainted with the work of Professor Babbitt, and other **Coloured Light researchers, who taught me to see special powers in the different colours.**

For example, to recognize Yellow as a special source of strengthening the nerves.

Certainly, there lies primal power in that race itself, but equally so in us.

This power is increased through the correct choice of colours.

We, for our part, also conducted very good experiments with colours on a wide variety of patients, especially those who were depressed in their nervous and emotional life.

Now we know, that almost all patients are affected in their mental sensations by their physical disorders, just as, on the other hand, emotional states can be considered causes of illness.

This proves that the correct Adjustment of the Colours of our Environment is a Stimulus, a Strengthening, and can be a First-Rate Remedy.

We saw that some people came alive in a certain colour environment, and that spring colours, especially cheerful tones.

My suggestion is to Surround the Mentally Ill With Cheerful Colours.

Dr Engineer Halbertsma, the great Dutch Light Researcher, reported that they had furnished rooms in spring colours in hospitals, in which soldiers whose nerves had been damaged by "Shell shook", from a nearby grenade, they recovered quickly.

And they had also had excellent experiences in Insane Asylums, with differently coloured rooms, confirming what had been established in the reports of our Society, and by qualified experts.

We had observed that our glass painters became Irritable, and unwilling to work when working in Gray rooms, and on Gray objects.

But were in a Good Mood, and more Cheerful when working in Yellow rooms, and on Yellow glass.

It was not uncommon for one or the other to **Fall Asleep when painting on Cold Cobalt Blue.**

We saw an old lady, whose **bedroom was decorated in Gray tones, and faced north, lose the Bad Humour** she had always displayed upon waking. When she moved her bed into a room decorated in spring tones, facing east, and receiving the sun through a magnificent Yellow silk curtain, which porous like human skin, **scattered the blessing of light far and wide. We saw that Overstimulated People Could Sleep again with Yellow-Green hues on the bedroom walls, a Blue ceiling, a Blue hanging lamp, or a Blue lampshade.**

> ***"Blue induces Sleep, Yellow Strengthens the Nerves, Red Excites."*** *- says an old Colour Scientist.*

Is it really so much to ask of our neurologists, and psychiatrists that they create rooms in different colour combinations, and test their effects on their various patients, after we, through our experts, have preceded this with such successful experiments. More Doctors and Hygienists, are joining our efforts and recognizing that with Chromo-Therapy, the Study of Colours, a new, humanely beneficial science is emerging.

Colour-Therapy in Epilepsy

When some time ago, a patient afflicted with Jackson's Epilepsy (Jacksonian seizure is a type of focal partial seizure, unusual electrical activity), the disease that usually leads to early death or mental insanity, wrote to me that when he had recognized the **Strengthening Influence of Colours on his shattered Nervous System.** The man, due to his profession as a civil engineer, was often out of the area. Whenever he was riding his bike along the country road and felt an attack approaching, he would hurry to a meadow, striving to land as softly as possible if he fell. **One day, as he cast his gaze upon a Flowerbed, he realized that his attack quickly subsided.**

Repeated experiences of this kind then prompted him to approach the matter systematically, to decorate his home with colours, and to test them on himself.

And I must say that the man sent us material from which science can derive much. But practitioners of the artisan trade and building experts have also approached us: the decorative painters have, in their magazine, headed by Mr I. Leipfinger, who is well-versed in matters of colour, compiled a wealth of experience with the colourful decoration of human dwellings, based on our work, and have just dedicated a special memorandum to this **highly important subject, which places Colour Hygiene at the service of the decorative painter as a new and beneficial field of work.**

The realization that Colours can no longer be introduced indiscriminately into the spaces in which people live and rule, but that we must adapt them to our disposition, our needs, and our living conditions, and that with colours we can influence our moods, and our work capacity, slowing them down here and stimulating them there, is increasingly gaining ground.

> ***"Create Colourful buildings, bring the joy of Colour to our cities, to our large and small settlements."*** *- Bruno Julius Florian Taut, renowned German architect, urban planner and author*

(Taut was distinguished by his devotion to colour. He applied lively, clashing colours to his first major commission, the 1912 Gartenstadt Falkenberg housing estate in Berlin, which became known as the Paint Box Estates. The 1914 Glass Pavilion, an illustration of the new possibilities of glass, was also brightly coloured. The difference between Taut and other architects, was never more obvious than at the 1927 Stuttgart Weissenhofsiedlung housing exhibition, in the contrast of pure-white entries).

We must bring new light, new joy of colour to the masses, spare no effort in this endeavour, and instil it in the youth, even the youngest.

Even if it doesn't yet understand the values of colour, it still feels them; it re-infuses itself with the sense of beauty.

The understanding of colour and the joy of colour retreated before what we call culture, which in a certain respect was merely degeneration, and fled to the common people; to those who spent their lives in sunlight, in nature, in the mountains, or by the sea.

Truly, our eyes must become accustomed again to Nature's most beautiful gifts, its treasures of Light and Colour, which can bring us a new blossoming of life, a more joyful time.

The English Physiologist Foxton recently pointed out the certainly distressing fact that civilized people, in furnishing their homes, decorating their homes, and even in painting various everyday objects, are increasingly inclined toward certain dull, almost expressionless colours, such as Gray-blue, Dark Brown with Green, and similar combinations that are reminiscent of reminiscent of dull cloud shades, yet having nothing in common with the luminous splendour of sunny nature.

More vibrant Colours were dismissed by many, even the most educated, as unpleasant and tasteless, and were often mocked for reflecting the aesthetic sensibilities of the less civilized rural population.

The eyes of the simple, naturally living person function more naturally than the optic nerves of the cultured city dweller, which are subject to far greater strain and often degenerate through overexertion.

Dust, soot, the bright light of electric lamps, the hustle and bustle of city life all cause damage to the eyes of civilized people, which we must counteract through Colour Hygiene.

The English scholar also sees the decline in colour appreciation among civilized people, as a sad sign of degeneration, which only proves that our sense of sight has become so nervous and pathologically sensitive that it can no longer perceive strong colour effects.

This is where the Hygienist, Education in School, and at Home must come into play.

A Berlin expert, who is a member of our society, recently pointed out the strange fact that rooms intended for social purposes are kept in Gray instead of being given friendly, invigorating colours. As a practitioner, he has now taken it upon himself to make a transformative impact in this sense, and it is said that he has convinced, and satisfied all his patients.

I now want to recite some of the Letters of the Epileptic mentioned earlier, who, with such great joy and perseverance, studied the effects of colours in order to harness the powers of colour for his severe suffering.

Indeed, he succeeded in overcoming severe periods of suffering by properly harnessing the powers of colour, which are still so mysterious to humanity.

Healing Effects of Colour Irradiation

"Right at the start of the war, I, a severe Epileptic, was given command of 24 men.

Nevertheless, I persevered, and what remedy did I employ?

The officers mess was located in a village pub, which, had windows made of coloured cathedral glass.

At the same time, there was an old pilgrimage chapel on the construction site, which also had colourful panes in the windows.

If I felt unwell during the day, **I would simply retreat to this chapel for a short time, and pray to my Saviour!**

I was always helped!

In the evening, I always sat near the brightly coloured windows of the Inn, and was able to prepare my reports with fresh minds, so that everyone generally said: This seems suspicious to us, because at first he pretended to be plagued by **Epileptic Seizures, and since we've employed him here, none of us has ever had the opportunity to witness a seizure!**

I didn't even know at the time who I actually owed my healing to.

According to my explanation above, only 2 remedies can be considered: either Prayer or the Effect of Colours.

For my part, I naturally claim both, at the same time!

After all, the unbeliever who denies the power of prayer, must admit that the healing effects of colours cannot be denied, or he belongs to that class of people who cannot be convinced by any means, even if they have had the corresponding experiences first hand!

After a few weeks, I was sent to Fort Neumühl, near Kehl in Baden.

I became seriously ill.

I also lacked all the Remedies mentioned above, such as Coloured Glass or Flower Carpets.

So it happened that in less than 2 weeks I became so Gray that even the deputy officer sent a report to the Strasbourg Fortress Hospital, on the basis of which I was immediately discharged. I was given quarters with colourful windows, located in the middle of a beautiful park.

While marching to my new position, I suffered a severe seizure in Strasbourg.

A colleague, immediately had me taken to the Pub opposite.

This restaurant also had colourful windows, and since my colleague already knew from earlier how soothing the colours were for me, he had me brought close to a **Violet-glazed window, which happened to be intensely illuminated by the sun, bathing the entire room in Ultraviolet light.**

After 10 minutes, he had the desired result: I got up without any help.

In my neighbourhood, I had seen glass panels hanging in the windows of a living room with beautiful, colourful still life's.

I thought of decorating the window in my living room as well.

I placed my large camera at my window in such a way that, with the magnifying glass open, the entire landscape could be seen on the glass plate in the camera. One evening, I removed the glass plate from the camera and closed the curtains, but had not removed the camera.

When I awoke up in the morning, my room shone with a beautiful gold light from the rising sun, I stayed in bed, because that was precisely where the sun rays captured by the lens of the camera were projected.

Never before have I gone to work so cheerfully and happily.

Now I assert with certainty what I still could not have known: that nothing else may have influenced my transformation other than the Colour Irradiation.

In Hamburg, the colours only affected me in my room at night, and kept the attacks at bay, while during the day, I saw no other colour than the gloomy, tar-smeared walls. In Wilhelmsburg, I had the most beautiful landscape, thus keeping any influence of colours on my mind at night!

These are surely compelling evidences of the Healing Effects of Colour Irradiation.

I remembered that as a schoolboy, **I always felt dizzy every time I tried to climb a leafless tree**, which, as a forester's son, I not only often had the opportunity to do, but was forced to do on Easter.

Hardly, for example, **when I reached the end of a walnut tree trunk that had lost its leaves, I had to turn back and couldn't climb any of the branches,** which had at least a circumference of 40-50 cm.

However, if the same tree had leaves, I dared to climb out to the thinnest branches, even when they were already bending under the weight of my light body weight, without feeling the slightest dizziness.

I climbed firs, and pines to the very tip in every season, as long as I could see the green canopy, which, especially with pines, only begins at a considerable height, so that my eyes could rest on a colourful spot.

It is surprising that here it was not the density of the canopy, but rather its colour, that prevented the feeling of dizziness that usually arises so easily and quickly.

When I climbed a Poplar (Liriodendron Tulipifera), which certainly had no dense branches to cover my back or obstruct my panoramic or distant view, only if it had green leaves did I get off without a dizzy spell.

I was always able to climb a solitary pine, which had a very pleasant needle system but remained Green year-round, despite its usually very tall trunk, without that dizzy feeling.

And the same was true of the balcony railing.

I had flower boxes installed around the railing, filled them with garden soil, and then sow it with Nasturtiums and Carnations.

After a few days, a magnificent Green appeared, and now I could step onto the balcony or stay there as long as I pleased without any feeling of anxiety or dizziness. One glance at my flower boxes, which had become colourful with all sorts of planted flowers and was mainly Green, was enough to see that after too long staying on the balcony, the dizzy feeling that occasionally arose was immediately relieved.

The colours, and the colours again, and again, had such a soothing effect on my mood and my frayed nerves." - Mr. V., Report 1

Healing Through the Effects of Light and Colour

"In almost every report I have sent you, I have spoken about how I first came up with the idea of using your method of **Healing Through the Effects of Light and Colour.**

I have also described to you the lasting healing successes that should not be underestimated.

I have recently been applying your method to myself, and others, and how things are going with me personally.

As the son of a good Christian family, I have always fulfilled my religious duties here in the city of Hamburg, and have followed the instructions given to me by my dear mother: "Pray and work!".

One day, I came across the life story of St. Valentinus.

Among his miracles and healings, I was particularly interested in the healing of an Epileptic Prince.

St. Valentinus took his colourful cloak, spread it out on the ground, and placed the prince, who at that moment was thrashing about in violent convulsions, on the cloak. Then he knelt down in prayer beside the sick child, and made sure that it could not fall from the bed.

The result, as it is further reported, was achieved after just a few minutes.

The child became calm, and after St. Valentinus repeated this several times, no more seizures occurred. Be made aware of this, and even these well-intentioned suggestions only resonated with me once I was sufficiently convinced by the Institute for Colour and Light Research, that my efforts could be successful in this regard. As far as I know from my coloured depictions of holy images, such as abbots, etc., wore a cloak or cape of Ultraviolet fabric, lined inside with Crimson silk. I was fortunate enough to be in possession of a large plush rug, which mainly featured these 2 colours (Ultraviolet & Crimson), and from that day on, I had it spread out in my living room.

Coincidentally, the attacks stopped for a few weeks. To my friends amazement, they no longer had the opportunity to see me collapse! After trying the new healing method 3 or 4 times, I was so firmly convinced of its healing power that I went to Berlin over the course of a few weeks, I encouraged other people to imitate my method. The sun's rays were caught by the console mirror placed on the opposite wall and distributed throughout the entire room. This coloured light had such a soothing effect on my overstimulated nerves that after just a few minutes, I felt better, and I could leave my room again without having to lie down on the existing carpet, without having to fear that the suppressed attack would subsequently flare up. **I had the best success with the friendly Red-Violet, which colour I always used, and with it achieved the results noted today."** - Mr. V., Report 2

We have recently received confirmation of this observation from many sources, including from medical circles, and Dr Arno Krüche, our honourable chairman, has stated in his "Medical Review", one of the medical world's most progressive journals has taken a position on this matter.

These are facts that medical science can no longer ignore.

The question of Chromo-Therapy has 2 aspects, arising from the Psychological, and Physical-Chemical Effects of Colours.

It is curious that leading figures in medical science still have no understanding of the latter, even today, when so much clarity has been achieved about the general energy of light in various fields of human activity, and dare to reject it outright.

The reference to the flourishing of plants in light, and the latter's powerful effects on the earth does not disturb them.

Humans Are Not Only Thinking Beings, But Also Visual Beings

Dr Peipers, who years ago already endeavoured to stimulate interest in coloured light and its use as a medicine to promote:

> *"For, what determines our actions in Climato-Therapy are, first and foremost, the* ***more favourable light, and thus also Colour conditions of high-altitude stations and southern health resorts. These certainly play a significant role in the beneficial influences on the patient's psyche.*** *But c****olours also play a role in the physical-chemical effects of the high mountains and the south."*** *- Dr Peipers*

However, we will first emphasize the psychotherapeutic applicability of colour and, in a later discussion, return to the other side of the question, the physical-chemical one. Dr Peipers, in his work as a psychiatrist, had accidentally **recognised the effects of colour on the mind,** and scientifically developed them. Later, he applied his research to other areas of pathology, concluding that there are only a few cases where valuable help cannot be provided by Colour Treatments.

Humans are not only Thinking Beings, but also Visual Beings.

Anyone who wants to grasp the whole, reach into the depths of the soul, and influence it, and with it the entire body: Must Cultivate not only Thinking but also Visualization.

Dr Peipers refers to the artist, who is our model here, and shows us the paths we must take.

He brings his thoughts to the human being, with the help of the senses by clothing them in Colour and form, and thus reaches the deeper layers of consciousness more reliably and triggers impulses of will through feeling and imagination.

A Therapy that calls upon the human being's Normal Conscious Faculties, has made similar progress; systematic use of artistic means is its purpose.

And in practising such Therapy, the physician is faced with an immense wealth of means offered by nature and art.

He must choose the right one from their diversity, case by case, and if he is able to gather and control the treasures that lie around him, he can render great service to the establishment of Physical, and Mental Balance.

Mental and Serious Physical Disorders

Enormous are the possibilities that lead to recovery within this framework, and it must be repeated, **Can Cure:**

1. **Mood Disorders.**
2. **Mental Suffering.**
3. **Serious Physical Disorders heal themselves in this way.**

Many and respected Therapists who have already achieved special laurels in this field, confirm this to us. This is the case with the American Professor Edwin B. Babbitt, whose great work “The Principles of Light and Colour”, 1878, with its 203 magnificent illustrations, including beautiful colour plates, can inspire confidence in anyone who wants to gain strength from Colour Therapy. Admittedly, Babbitt had not yet brought himself to embrace Goethe's Theory of Colour, but certainly not because he lacked insight into it, but rather because he had no opportunity to gain knowledge of it. Only educated within the framework of a Newtonian view of colour.

Through the Study of Light and Colours

> ***"Light and Shadow exist in Equilibrium in Nature; day and night balance each other out throughout the world; just as positive and negative forces must be equally distributed if they are to produce a perfect effect. Through the Study of Light and Colours, a whole new world opens up to us. Colours reveal to us the true dynamics of nature and humanity, and extremely powerful inner principles of forces that reach into the realm of the mysteries of mind and matter. Many conjectures thereby become science. Thus, nature develops the force and effect of life by causing one extreme to enliven another, and yet to keep another in balance. The protoplasm assumed by physicians to be the beginning of all life would be utterly powerless without higher and finer principles. We must ascend high along the line of the finer until we reach the region of the unlimited spirit."*** *- Dr Edwin Dwight Babbitt, MD*

Dr Babbitt also understands how to correctly play out the contrasting colours and how to allow cold, and warm colours to interact with each other.

Professor Babbitt argues that where there is too much Red or inflammatory conditions, Blue forms the balancing principle, while Orange-Yellow represents the great enlivening principle in Hard Tumours, and other inert conditions.

Therefore, his Blue chromo-lens, and the Orange chromo-lens are more effective in many cases than mere translucent lenses.

He used several practical instruments for healing through colours.

Such as the Chromolume, a device in which various glass rods are arranged according to their chemical and physiological properties and adapted to the various human organs. He calls his Chromo-Disc "better and more powerful", in which the corresponding coloured light acts through a lens on the affected organ in question, and to which the inventor owes good results.

He uses this instrument, which we have, incidentally, superseded by more practical inventions, for Nervous Excitation, Inflammations (of all kinds), Fever, Acute Pain, etc. For this purpose, the Blue glass disc is the most suitable; but Indigo Blue is also suitable. If the illnesses are still nervous, without inflammation and are sluggish, then place the Blue glass so that the white sunlight can shine through. Jerner used this instrument to stimulate the arterial blood, against cold feet and hands, etc. Red glass is particularly excellent for this, especially in combination with Yellow glass, which radiates even greater warmth.

Furthermore: To invigorate nervous blood, stimulate the stomach, liver, kidneys, etc., purple glass is best. Incidentally, Yellow glass is often also used for the liver, and intestines. Our physicians also tested the strengthening powers of colours according to Babbitt's instructions. Thus, according to Babbitt's instructions, yellow proved to be a stimulant for the digestive organs.

An elderly gentleman suffering from constipation drank water that had been standing in the Sun in a Yellow drinking glass and subsequently regularly stool, which he previously only achieved with Senna Leaves (laxative).

One should therefore investigate such things with experiments and not simply dismiss them.

Four Cases As Examples of Healing's Using Blue colour

1. Severe Pulmonary Hemorrhage: A lady suffered from severe pulmonary hemorrhage. As a result, she became very depressed and feared for her life. Blue glass panes were hung on the window in front of which she usually sat. She had to position herself so that the blue light rays fell on her neck and back for an hour every day. On the second day, the effect of the sun's rays was too strong, so that the patient absorbed "too much Blue light" and, as a result, felt a peculiar sensation in her throat and back and an unpleasant heaviness in her head. This feeling subsided the next day, when the exposure to the blue light was shortened. She immediately gained strength, and her cheeks began to colour the next day. After a week, she felt better than ever. Of course, she was not cured of her lung disease in this short time; only the chest pains subsided and her well-being improved. After another week of exposing herself to the blue light for a few hours a day, red spots appeared on her neck and shoulders: proof that this treatment had drawn the diseased blood to the surface of the skin. Professor Babbitt criticized this case, remarking that it was wrong to claim that the patient had absorbed "too much Blue light." On the contrary, too little Blue light was absorbed, as the white sun's rays had merged too closely with it. The **Blue Light** should have been extended over the head and the entire body, for 1 full hour.

2. Cerebrospinal Meningitis (inflammation of the brain and spinal cord): A lady from Cairo, Illinois, suffered from this disease for four years and, according to a letter from General Pleasanton, was freed from her suffering only through the use of **Blue light**, without any other medication.

3. Head Neuralgia: A merchant with severe neuralgic headaches, he exposed himself to a **mazarine-Blue Light** for 30 minutes and then felt completely clear in his head.

4. Rheumatism: Dr Robert Roland in New York writes: "A year ago, I exposed a man with Severe Rheumatism to the rays of blue light, which I shone on him through **2 Blue Disks**. After 15 minutes, he felt so free that he could walk without pain, but he complained of a metallic taste on his tongue. Another patient of Dr Fincke in Brooklyn also felt a taste in his mouth like verdigris as soon as he shone Blue light on his hand."

NB: This is consistent with spectral analysis, as the blue of the Jraunhofer lines detects Oxygen, nitrogen, barium, magnesium, chromium, nickel, copper, zinc, strontium, cadmium, cobalt, aluminum, and titanium. The 2 patients mentioned above must have been very sensitive, i.e., highly endowed with psychoether.

The calming effects of Blue, and especially Violet, on insane people have been confirmed by Dr Ponza in Alexandria and by physicians in French asylums.

Contraindications

However, this Light should Not be Used on those who are:

1. Apathetic.
2. Melancholic.
3. Withdrawn.

Dr S. Pancoast, MD, demonstrated the Healing Power of Red Light in a number of cases in his work **"Blue and Red Light."**

A few are mentioned here:

1. An 8-year-old boy had a slow recovery period from a dangerous case of **Diphtheria,** during which paraplegia (paralysis of both legs) suddenly developed, so that the boy could not walk and could only stand by leaning on a table or chair. They dressed him in all white clothes, placed him in a **Red Bath** for 1 to 2 hours at a time, and then exposed him to the **Red light of the sun,** causing him to soon fall asleep and sweat profusely. After 3 weeks, he was able to walk, and after 2 months, he was completely healthy, 2 years have passed since then without a relapse.

2. Complete Physical Exhaustion. M. R., 45 years old, had overworked himself early in his career in business and had gotten into financial difficulties. His body and mind suffered greatly. He could neither sleep nor eat with any appetite, and he was overcome by **complete depression.** First, there was pain in the back and head, which was soon followed by shortness of breath, anxiety, rapid pulse, and loss of appetite followed. **Treatment was initiated with this Red Bath**, and no significant effect has yet been observed in any patient. Even the first bath was successful and had a strengthening effect on mind and body. It was initiated cautiously, but the longer duration of the bath could be used.

Mr R. recovered quickly, even though he continued to run his business.
The first thing was that he got a refreshing sleep, sat with a greater appetite, and his kidney excretion showed a normal appearance.

> ***"The Red Colour can also have harmful effects if used in too large a dose or in an inflammatory condition. Just as iron is contraindicated in inflammation, Red should also be avoided in sanguine temperaments."***

The Yellow Colour, especially when supported by Orange and Red, forms the central principle of Nervous Excitation, and has a Purgative Effect. Tartarus Stibiatus (made from stibine), a white crystal powder, is strongly developed with Yellow, Orange, and Red when examined for its elements in the spectrum.

Another patient reports:

> *"I have applied the new experiment with the* ***Yellow Light, and am extremely astonished by the results. I found that water in a Yellow Glass, exposed to the Sun, has a definite Laxative Effect. Consumed in small doses, it has an extremely mild and Uplifting Effect on the Mind. It is most miraculous. The Yellow Light has, I note with gratitude, Revitalized Me."***

Babbitt explains; Yellow as Harmful In Certain Irritable States, such as:

1. Delirium.
2. Diarrhea.
3. Insomnia.
4. Palpitations.

Yellow is Beneficial in:

1. Sleeplessness.
2. Paralysis.
3. Constipation.
4. Colds.
5. Chronic illnesses.
6. Sluggish Ulcers.
7. And the like.

Yellow predominates in most poisons, such as potassium cyanide, strychnine, etc., the Yellow principle predominates as a nerve stimulant, and mixes with the Red principle of the stimulating blood.

> ***"Finding the right material to obtain the relevant healing colours is very necessary, because the colours visible to the eye are not decisive."*** *- Dr Babbitt, MD*

3. For Example: **Cobalt melted into glass produces a dark and fine Mazarin Blue, but has an imperceptible Red.** Examined with a prism, it shows Blue, Indigo, Violet, green, Orange, Red, and several thermal (positive) colours. **Such glass is therefore unsuitable for healing purposes because it contains too much carbon. On the other hand, Blue glass made from sulphate of copper oxide is quite excellent.**

Likewise, Red is the hottest colour, therefore it does not transmit as much heat as Orange or even Yellow glass. Each glass must therefore be manufactured according to its luminous power, because the eye deceives us. **Blue and Violet glass Are The Best for Inducing Sleep in Nervous People.** It is the most cooling of all colours; and when produced, as mentioned above, with copper oxyammonia sulphate, it best serves its medicinal purposes.

4. Violet glass (made with manganese) suppresses almost all Yellow; the Red is thereby greatly diminished; Green shades into black, and all other rays blend with Blue. Red glass (created with Gold) blocks all thermal rays and penetrates slightly into the Blue spectrum. Yellow, pure Yellow glass, is obtained from coal. Obtained from iron, Yellow allows the thermal colours to shine through, namely some Red, Orange, strong Yellow, small streaks of Green, and some Indigo. Hence the subtle tonic effect of iron. Many other coloured glasses are also in use.

> ***"Incontrovertible facts suggest that Blue, Indigo, and Violet have Electrical (calming) Effects."*** *- Dr Babbitt, MD*
>
> ***"Ordinary Electricity and Magnetism both develop indirectly through the sun's rays, while terrestrial or earth's electricity emanates from minerals, metals, trees, animals, and humans. Electricity is the principle of cold, but it can generate the greatest heat through its chemical action with thermal substances. Likewise, Blue, Indigo, and Violet contain the cold principle of the spectrum. Thus, greater heat can be generated through their combined action with thermal colours than can be achieved with red alone. Proof of this is the experiment of General Pleasanton in Philadelphia: by placing Blue discs on top of white ones, the thermometer in his greenhouse rose to 38℃, while the external atmosphere was only 2℃, i.e., only slightly above freezing. According to chromo-chemistry, Blue light rays develop great heat when they come into contact with thermal solar rays. But blue and violet cannot generate heat in and through themselves because they are electrical; this can only happen through chemical interaction with warm substances or when bent into magnetic curves."*** *- Ferner*

Here we have the opportunity to release New Sources of Healing and warmth through the skilful interplay of Colour Forces.

In any case, Babbitt deserves the credit for having scientifically tested the healing effects of colours in large-scale practice.

He also recognized that **Rays Are Transformed Light Forces:**

> ***"Differently coloured liquid solutions, even wallpaper, furniture, and clothing, can have a healing effect through their colour quality."***

He also recognized that special powers lie dormant in vibrating light.

All Therapists who wish to enter this Important and promising field of Healing are therefore Advised to Project the Colour Rays onto the Body In Vibrations. It is not simple, smooth illumination that is decisive, **but the Powerful Effect of the Vibration. The still air that surrounds us, has no such significance for the body as the moving air.**

This influences our physical being, to a far greater extent, than the static atmosphere, from which our skin receives only weak stimuli.

The same is true of Light. The skin, too, has its systole-diastole, its constantly alternating modes of activity, its ebb and flow.

A particularly sensitive part of the skin is the light-sensitive retina, which is highly susceptible to Colour Light Vibrations, and opens the gates to our physical being.

There is no doubt that **Chromo-Therapy, applied in this way, will achieve even greater achievements** than those already achieved by individual Therapists.

Artificial Coloured Light Treatment, the application of the intermediate rays of Ultraviolet, and Red Light, will achieve new successes by oscillating these rays. The American physician Dr Emmet, and the Russian Dr Snegirev pointed out in professional publications in 1879 and 1884; the healing influence of the sunbath on many abdominal ailments and similar symptoms. One can now achieve surprising healing results in a wide variety of conditions with such light-soaked tubs. **Suggestions are being made in our circles to equip the sunbath with coloured light powers, and to have a tub made of cast glass available for coloured light treatment. The light can also come from below. All-round exposure of the patient in such a tub is Allow treatments that would astonish even the masses of doctors. For very few people have a true idea of what the application of general light energy means for the sick and exhausted.**

With such treatment aids, a true rebirth is possible.

The tub should be usable at any time with the help of artificial light sources, and it is important that the patient is not simply illuminated, but that the coloured light energies are projected onto the body through vibrations.

Just as calm water and calm air do not provide the same benefits to the body as if these forces were set in motion, so too is the light and the colours obtained from them through resistance. The vibrations revitalize them to a great extent, and with rapid results, which make it our duty to put this treatment into general use as quickly as possible, coloured showers could also be combined with this sun or Coloured Light Bath. The Chromo-Therapists Dr Scrivanich, and Dr Peipers described this idea to me as a fortunate one.

One channels the colours of the spectrum into a water jet, and in conjunction with the latter, conveys this entire splendour to the patient.

One will be amazed at the invigorating effects!

To understand the effects of such things, one must know the founder of the general Systole-Diastole Science, Professor O. Rosenbach.

He teaches us that every energy has a dual character (work and reverse work).

Tension and Relaxation work within the body in each of its individual parts, and in the larger external world.

The functions of the nerve pathways are also tied to such an up and down.

The same up and down of the skin's life is a necessary complement to this.

A current of Tension, and Relaxation from the external world provides the excitation that pushes from within to the outside, or vice versa.

The excited object expresses itself with the opposite counteraction.

Think of the peaks and valleys of a wave, and the "double pendulum oscillations, which manifest themselves as systole and diastole" (Professor O. Rosenbach). **Tension from outside is followed by relaxation from within.**

> *"The possibility of death from lack of water (death by thirst), or from large water losses (cholera, heat stroke, etc.), shows clearly enough that even a large, sudden release of loosely bound water quickly destroys the functioning. As long as the active protoplasm is subject to strong operational stimuli, it must activate and excrete water, just as it must generate or release heat; but only as long as the intensification of the stimuli, its maximum kinetic energy, just overcomes the tensions to which the supply of firmly bound material is subject. As soon as the displacements brought about by a stimulus exceed a certain limit set by the individual tension equilibrium, as soon as the maximum stimuli relax the last reserves of energy without triggering a regulation, i.e. if the opposing tensions are not brought into effect, in short,* ***if they cause displacements that are incompatible with maintaining the elaborate balance of the organization (the basis of the transformer's construction), the operation halts or ceases completely due to the destruction of the structure or the elimination of the ability to achieve functional tensions (the regular wave motion in all parts). This means that the possibility of maintaining the dynamic or elastic balance of the organization, which is characterized by the perfect, i.e., Double, Pendulum Oscillations, which manifest themselves externally as systole and diastole, is lost. We have already explained how dehydration affects healthy individuals."*** *- Dr Ottomar Rosenbach, MD, in "Heart Diseases and their Treatment", 1897.*

Rosenbach rightly sees **the wonderful, constantly changing yet unbreakable, mobile yet firm Connection of All Components of the Body as the Essence of Physical Life Processes.**

> ***"The Human Circulatory System Is Not Closed, but is connected through surface organs: Lungs, Skin, Nerves; with the finest currents and with the masses of the outside world. Through these portals and instruments, he releases the Currents, Energy Forms, and masses formed within; through them, he incorporates active Currents and Masses."*** *- Dr Ottomar Rosenbach, MD*

Every tension in the body corresponds to a relaxation of external forces, its intakes. This results in an expenditure on the outside. But then, income is also sought from the inside. Thus, a power play arises back and forth, releasing, separating, dividing, and contracting again.

The mysterious powers of light become clear to us precisely in such a bath.

If one lets the light fall into a glass filled with water, one sees how the light is lifted, pushing upwards. If we bathe in illuminated water, we have the same sensation: we feel supported, lifted up. When bathing in the dark, on the other hand, we have the feeling of sinking, of being pulled down.

These remarkable properties are clearly evident to everyone. If science takes them on board, it will lead to new discoveries and many practical applications.

Humanity Must First be Educated to Understand the Miraculous Effects of Light and Colour, while the matter is so simple, that everyone can conduct the most convincing experiments in their own environment.

A medical doctor writes to us:

> ***"I recently told a gentleman who had collapsed from overexertion that he could strengthen his nerves with Yellow Light. He only needed to put good Yellow Glasses in his windows, and Yellow Carpets, and Wallpaper in his study, but in the evening, because he suffered from insomnia, he should place a Blue lamp on his bedside table and surround his bed with Blue curtains. Yellow Strengthens, and Blue Calms.***
> ***He tried it, and was delighted with the effect within a few days."***

Professor Ponza, who ran a Mental Asylum in Alexandria, **brought a patient who believed he was buried alive and refused food, drink, and speech into a room saturated with Yellow Light. And lo and behold, that very same day the man allowed himself to eat, and within a few weeks he was Discharged as Cured. The blessing of the Powers of Light and Colour.**

Our field grays also appreciate the colours very well.

> *"The field gray is practical, but the colour itself is not beautiful", a soldier returning home from the fray told me. "And that's why", he continued,* ***"we love and seek the colours more than ever, and whoever decorates our homes with them is a benefactor to us."***

We were amazed at the richness of colour in the attached pictures of all kinds.

Do they have a purpose, a value? Oh, they have value! **They delighted the eye; they distracted the viewer's attention.** And what is a necessary need for the healthy applies to an even greater extent to the wounded and sick. **Hospitals and other accommodations should always be colourfully decorated.** I have observed many comrades expressing their joy again and again when they arrived at a colourful accommodation. How lively and good the mood was then! There is a direct longing for colour in most of them! Some can express it, others cannot.

One feels it clearly and generally, for another, different colours are inappropriate. I received this impression most strongly in the one belonging to an auxiliary hospital, established Christian Hospice in Leipzig on Seeburgstrasse, where with deep empathy for the souls of the wounded, skilful decorative work was carried out. So let us give our field-grey soldiers the opportunity to satisfy their love of colour, wherever possible.

Goethe Said So Beautifully:

> ***"In the Reflection of Colour We Have life!"***
>
> ***"In my century I am the only person who knows the truth in the difficult science of colours—of that, I say, I am not a little proud, and here I have a consciousness of a superiority to many."*** *- Goethe, in "Conversations with Goethe"*
> ***"Without Colour, There's No life!"*** *- Dr Walser, MD, a physician who loved light and colour, to whom humanity owes much gratitude for his work in this field.*

The power of colour still awaits its widespread acceptance.

> ***"When the power of Red light is absorbed by the body, it exerts a decomposing effect on the salts within it, forming ions, these finest structures that, as carriers of electrical energy, are of utmost importance for the operation of our life machine."*** *- Josef Wilk*

Through the distribution of these ions, various tasks now take place in the body. For example, when the Red light force encounters a citric acid in the body, it separates it into acid and iron. The latter is transferred to the bloodstream and thus made useful for our growth, the acid is excreted in the urine, etc. And so one can also pursue the even more extensive emolytic activity of Blue Light.

Dr Walser reports that he achieved great success with Blue light in a wide variety of illnesses.

For example:

In 22 cases of Skin Diseases, he cured 82% (18 cases).
In 51 cases of Nervous Exhaustion, he cured 80% (41 cases).
In 28 cases of Rheumatism, all were cured 100%.
Of 6 cases of Syphilis, he cured 67% (4 cases) with incandescent light, and Blue irradiation, 48 cases of Chronic Constipation were all cured 100%, with Blue irradiation, arc light, etc.

Colour Light Treatment was given priority, and Vibration Massage was also used, which stimulates the metabolism in turn, increased and thus facilitated access for the light forces. Every substance is built from Emissary Energy, and this is Transformed by the Light Forces into Other Forms of Energy.

Heat, Electricity, Light is Awakened from it. The aforementioned iron salt is bound emissary energy until other forces, in our case Light, Cause a Regrouping of its Particles, Giving Life to New Forms and Forces.

Light and Colours in the Service of the People's Welfare

New research is breaking ground in matters of Light and Colour.

And it is based on **Goethe's Theory of Colour, which the distinguished scholars had left unnoticed for far too long.**

Goethe, who was a far more thorough observer of nature than was assumed until recently, puts forward the claim in his theory of colour; that colours arise as a result of a turbidity or darkening of white light, or by exposing dark and murky light. By illuminating dark, blue, and ultraviolet arise.

Goethe sought unity in the flight of phenomena, overcoming matter with spirit, lightness with unity, darkness with light.

One light lives in all colours, one thought in all creation.

These teachings of Goethe were examined by experts.

The great physicist Dr Arnold Brass, whose significant discoveries about Light and Colour, long Ignored by Science, and suppressed by certain opponents in an unworthy manner, were further developed and enriched through his own research by the physicist Professor Karl Horn, has become a pillar for **Goethe's Truths About Light and Colour, which will now spread their blessings over the German People, and All of Humanity.**

Other courageous men are joining the aforementioned in their thorough, tireless work for Goethe's great, long-hidden Discoveries in the Field of Light.

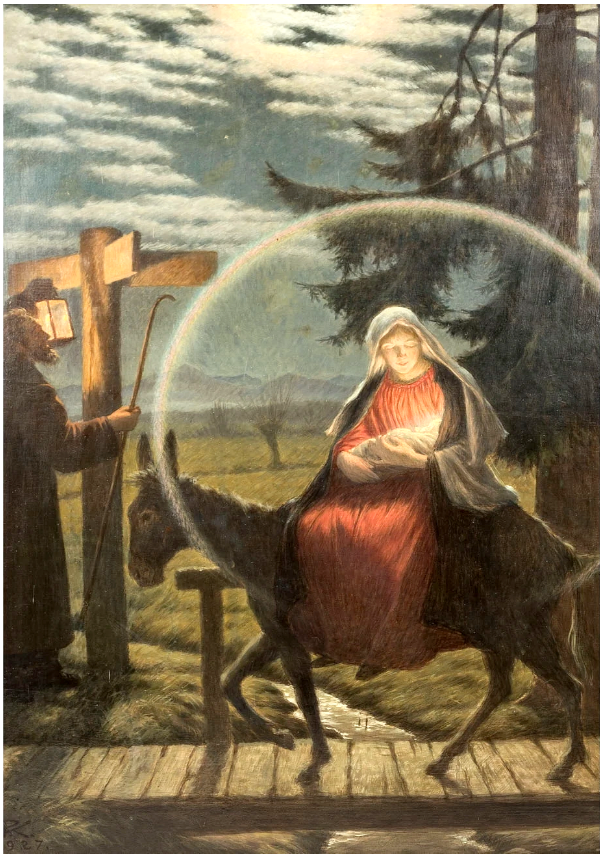
Such as Paul Kaemmerer, the learned painter, and highly deserving supporter of the Keim Society, to whom a monument has also been erected here for his self-sacrificing struggle for the Understanding of the Forces of Light, and who, along with Horn, was also able to have the joy of witnessing the victory of the good cause he represented. Our experts must learn to Understand that **Colours, Are Objective Physical Energies.** Our higher educational institutions Must Pursue Colour and Light Physics In This Sense. Newton knew nothing about diastole and systole of the eye, or about organ aggregates that function in diastole and systole — this is emphasized by Professor Karl Horn. Therefore, it is understandable why many doctors and physiologists have already turned away from Newton's teachings and turned to Goethe's. For them, it will still be primarily a matter of learning about the diastole-systole physics of Goethe and Rosenbach (the great energeticist), as the basis of diastole and systole physiology and of using the theory of physical transformation aggregates as the basis for the theory of physiological transformation aggregates.

The healing effects of coloured light can only be researched and applied on the basis of Goethe's Theory of Colours.

So says Karl Horn, and we may agree:

> ***"Can we, not assume that the coloured natural effects, just as the magnetic, electrical, and other effects, are based on a reciprocal relationship, a polarity, or whatever one might call the phenomena of the dual, even multiple, in a decisive unity?"*** - *Karl Horn*

Goethe teaches us that: Colours Arise from the Dynamic Interaction of Light and Darkness (Positive and Negative Forces), and physical material (turbidity, light resistance). When light energy acts on a light resistance, both the light energy, and the material are transformed. In the theory of light, both positive and negative exist. Minus-bore processes, Positive and Negative Forces, as In All Other Physical Phenomena, such as Electricity, Magnetism, Heat, Movement, Etc. Light and The Theory of Colours Has a Close Relationship to All Other Parts of Natural Science; these Must Therefore be Connected and Developed. Light and Darkness, Acting Polar-Dynamically on the body, evoke Colour contrasts, and allow us to recognize the General Natural Law of Duality, Which Applies Everywhere In Creation, and Has Yet To Be Revealed to the Great Mass of Humanity.



Paul Kaemmerer, "Heilige Familie auf der Flucht", 1927

Colours Have Objective and Subjective Effects

The organic, polar-dynamic activity of the membrane of our eyes, and its relationship to the polar-dynamic external world; finds its proper appreciation in Goethe. Newton's purely monistic-atomistic doctrine fostered a world-view, that has harmed us.

Goethe approaches Primal Phenomena, uncovers with his research the most Mysterious Forces in the Cosmic Workings, and lays the Foundation for a Philosophy of Life that is particularly suited to us Germans. **Therefore, the fight for Goethe's Theory of Light and Colour is a Fight for the German cause, for German light (For the Progress of Humanity, and its awareness of the Forces of Creation). Through Goethe, we see that the effectiveness of light energy is counteracted by a dynamic, reactive energy that establishes equilibrium between forces. The centrifugal effect of light is counteracted by a centripetal force as a counterforce; darkness responds to light.** The conservation of energy cannot be truly justified by effect and rest. If we substitute reverse work for rest, we will understand the matter better. We erred by taking, with Newton, a crude experience as a mathematical phenomenon; **Goethe places the colour phenomena on the correct, dynamic, foundation. We must begin here in order to gain clarity about many things and to be able to properly grasp the world view.**

Light is more than monistic wisdom gives it:

Light, the Source of Colours Is: Force, Matter and Space.

Our science, which has become material, will have to embrace new insights, and can no longer avoid Goethe's doctrine of the counterplay between the forces of light and darkness in the physical world. Our schools currently teach nothing about this counterplay, the law of polarity. **And from this knowledge, a new philosophy of light and darkness, a new healing art, and much more will grow.** Goethe showed us the diastole and systole of the eye, and this ebb and flow of life's workings applies to the entire body, down to its smallest parts.

The theory of the healing and strengthening effects of colours only finds its proper foundation through delving into the works of Goethe, Rosenbach, Brass, and other honest researchers. Brass builds on Goethe's conception of the origin of colours from the interaction of light and darkness against resistance.

He says that where energy is directed over a Low-Energy area, Blue-Violet or "chemically acting force", is produced under all circumstances; where a low-energy zone is forced into a high-energy one, yellow-red colours appear to our eyes and mind (objective experiments revealed warmth).

Clothes and fabrics, wallpaper, and carpets can also heal and strengthen through their colour effects, and we will gain an understanding of this by examining the studies of the researchers mentioned in our writing. The Therapy and Hygiene of the future, the new spa and recreation facilities now emerging

will take these facts into account, must master Light and Colours to the same extent as the knowledge of the Therapeutic-Hygienic values of These Forces Arise.

Light and Colours Are Physical And Energetic Phenomena; therefore they can be combined into a final unity, capable of unification at one point.

> ***"We can derive all phenomena from a primal force that works to eliminate existing differences, to unite all beings into a homogeneous mass at a mathematical point."*** *- Dr Julius Robert von Mayer, MD, known for the* ***discovery of the law of conservation of energy; while a ship's doctor, observed the colour of European sailors blood, and developed a theory that Heat and "Motion" were related, eventually leading to the concept that energy cannot be created or destroyed but can only be transformed from one form to another.***

Materials testing for the theory of light forces must be directly re-established.

We need a lighting technology that, analogous to the already fully developed field of electrical engineering, enables the rational exploitation, measurement, and transformation of light forces, just as we exploit and control other natural forces today.

> ***"Physics must begin with the theory of light, since light and the eye are the best organs for human cognition."***

We need light institutes to research light.

The powers of light are particularly evident at high altitudes.

The experiences of Dr Backer, Rikli, and others teach us this.

What good could the sun alone do on Bavaria's mountains if it were made available to the hundreds of thousands of needy as a remedy and tonic by skilled hands?

We have plenty of Lupus and other Tuberculous diseases in our country as well, and have therefore established our own committee to combat these evils.

May he direct his gaze to where rapid, safe healing is guaranteed for our legions: to the solar powers of the Bavarian highlands.

Let us create Light Healing Centers in these regions!

We need serious peace work, revitalization in hygiene and also in the economic sphere.

Our Light and Colour Healing Centers will then attract the desired stream of tourists from all sides, thus also bringing economic blessings.

Become Light Doctors! I call to those who are called.

Unimagined joys blossom for the Helio-Therapist, as I saw first hand among the greats in this field, and as the recent successes of Dr M. Backer, who owns a solar home in the Allgäu, confirmed to me. Some cases presented to the wider public in "Over Land and Sea" must have aroused everyone's delight.

These are, after all, true rebirths through the mysterious weaving of the sun's power. We saw a 12 year-old girl with Spinal Tuberculosis, resulting in a hunchback and complete paralysis of both legs.

Next to her, we saw the same girl after an 18 month **Sun Cure.**

The Tuberculosis was Cured, the hunchback disappeared, and the paralysis of her legs was eliminated.

We saw a 4 1/2 year-old boy with 34 tubercle lesions in his joints and bones, with festering tuberculous glands, and with peritoneal and pulmonary tuberculosis.

Later, we saw the same child, Cured by a Sun Cure, working in the garden!

The sun, as a physician, works wonders upon wonders!

And let colours also come into effect alongside the light; be light and colour healers.

Prof. K. Horn coined the beautiful phrase: "Bayreuth of Light", which may rise again on Hohenpeißenberg in the Alpine foreland.

The sources of light and the beauty of colour, for the salvation of rich and poor alike! **Where nature grants, drawing from its abundant source, where art must be invoked, also from the power of artificial light sources – which, in the right hands, achieve far more than the masses imagine - pouring blessings.**

> ***"All Life Is Light, all light comes from the sun.***
> ***All life comes from the sun.***
> ***When will our doctors and governments finally grasp this fountain of youth on the German Alpine heights."*** *- Karl I. Luther*

Whoever serves the light, serves God himself, works in the plan of the highest creation. Millions of people draw abundant blessings from the sunlight mostly unconsciously. Only a small handful understands how to enjoy the sun's blessings and utilize them for the highest physical well-being.

The vast majority, however, pass it by carelessly, disdaining its sources of strength and healing, since they are ignorant of them. And yet there are noble and experienced men who teach us what the sun does for our health and what it can offer us in the art of healing. And there have been such men at all times, and they have found their followers. But no age has been as ripe for such knowledge as ours, with its culture that oppresses so many, that confines millions of people to closed spaces, removes them from nature, and alienates them from their natural lives. We spend too much time in our clothes; we have become woolen, but wool is stolen skin. **We should exercise our own, restore honour to the external life of our body and thereby relieve its inner life. We should cast floods of light over our bodies, making their powers available to the entire bodily workshop, awakening new life, resurrecting fresh instinctual forces.**

In this spirit; The Munich Society for Light Research, and this document is intended to serve this purpose, offering the researchers who distinguished themselves in the fight for our good cause, the due tribute of gratitude and may

be an incentive for all who feel called to work in the field of light research, to participate and to bring the blessings of light to humanity in broader waves than before.

We demand that **our society's plans be supported by the biological proof of the forces of light and colour with the help of neural analysis.**

This will provide material that will allow physicians and researchers to continue their fruitful work in the field covered in our paper.

A physiological, neural-analytical investigation of the effects of coloured light will bring us much that is new, foundational for the wisdom of the ancients and powerful tools for the colour light therapists now emerging.

We must investigate the influence of colours and light on the body with closed and open eyes. In this way, we determine their physical and psychological values.

The irradiations should be carried out with the body completely or partially exposed.

And the resulting pulse changes and other phenomena of physical life, which can be determined with the finest instruments, are to be precisely recorded by our doctors.

In doing so, we will quickly be able to discover the Powerful Expressions of the Individual Colours; the Invigorating Principle of Red and Yellow, the Peculiar Expressions of the Deep-Penetrating Ultraviolet, etc.

Through Neural Analysis, we have brought the testing of the finest medicinal substances onto a completely new basis and, for example, demonstrated that the scent of concentrated Poisons has a Paralyzing Effect Upon Inhalation, while the scent of diluted substances, however, has a stimulating effect that increases with potentization, varying to a certain degree but depending on the individual subjected to the experiment.

In this way, **the differences between subtle and coarse Light and Colour Forces can also be determined**, which, for contemporary **Hygiene and Therapy, means nothing other than the discovery of highly desirable new territory.**

It is impossible to express in brief **the delicacy and purity of the vital expressions of the Colours born of Light** that are expressed in such biological tests. In this process, quantities of matter and expressions of life are discovered that are inaccessible to any scientific proof other than Neural Analysis!

The Most Mysterious Dynamics of the Primal Forces of Creation Come Into Their Own in these investigations.

We Can Rejoice In This: For the Sake of the Blessing that Arises From It; For Suffering Humanity In Need of Strengthening.

Nature and Spirit Cannot Be Constrained by 680 Colour Norms.

Life and Humanity Cannot Be Understood and Conceptually represented by 680 numbers: Colour reveals the life of Humanity and Nature.” - Prof. Ewald Paul, Director of the Munich Society for Light Research, in “Light and Colours in the Service of the People's Welfare”, Therapeutic-Hygienic Studies, and Experiences with the Collaboration of Qualified Physicians and Experts, 1921.

Public Education About Light Therapy

“I have the following to say as the Head Physician of the first Medical Light Therapy Clinic, the “Red Cross”, Berlin: Years ago, the concept of **Light As A Healing Agent** was still unknown in the widest medical trade circles throughout the world.

After I compiled the scientific research on this topic, in my archives for light therapy based on extensive patient data, light was introduced as a healing agent in many newly established Light Therapy Clinics, naturally to the great chagrin of many General Medical Trade Practitioners, and Professors who had initially been alienated, and hostile towards the subject.

As Editor of the “Archives for Light Therapy”, this was done with regard to the great cause, which involves nothing less than the integration of a new natural force, previously unused for healing purposes, into the plan of healing: Light!

I did so in the conviction that Light, Like Truth, would ultimately always prevail, for Light must remain Light, despite all the business envy of the adversaries within the college's own camp.

As is well known, there is no worse envy than that among Medical Trade Doctors.

If popular enlightenment for a good cause encounters such resistance from those who should actually be the appointed representatives of the cause of light and truth, the latter should not be surprised when attempts are made by others to take over public enlightenment.

The healthy sentiment of the people simply cannot be rolled back 100 years as easily as the representatives of science succeeded in doing in the Priessnitz case (with the Water Cure).

Now, with the Light of the world, a new healing power is being demonstrated. The same thing could happen with Light, as with Water.

Through official silence and denial, if the healthy instinct of the people did not also have a say.

The old contradiction between Medical Guild constraints, which seek to forbid doctors from advocating for innovations, and popular enlightenment, which demands the best as just good enough for itself — this old contradiction will persist as long as our bureaucracy, which dominates all circumstances, assesses everything from a legal standpoint, treats every innovation according to its still.

We are faced with a huge gaping gap in popular enlightenment with every new discovery and invention: **enlightenment from qualified sources is opposed by the monopolization drive of the old school**; enlightenment from unqualified sources is opposed by a sense of decency that would even protect backward authorities out of piety against the new attackers.

A New Community, from qualified sources, would have to step in to Educate the People.

The steps to this end have been initiated.

The Archive for Light Therapy has been in existence as a collection point for a year and a half, and the journalism of the new Association for Public Enlightenment is diligently at work. Be presented as truthful based on the facts, since it corresponds to the patient journal of our 4,000 patients at the "Botes Kreuz" Light Therapy Clinic, which the management has access to.

"For the benefit of no one, to the harm of no one", that is his standpoint on the steep, difficult path he must tread as a pioneer for the cause of light, responsible solely to his conscience (indeed, even without the prospect of thanks and recognition from his petty contemporaries), as long as the gap yawns between the envy of colleagues and uninvited public enlightenment remains.

He alone is then the one called!

Now that the Light Healing Method has spread throughout Europe, he can no longer ask a few disaffected Central Europeans, **who would like to monopolize everything, for their permission to allow him to bring light to the world as a Healing Agent.**

Above all, he must not care about those who have fled under the protective wing **of the certain Journals, and their "opinions", from there intimidating the world with their "Monopolization Plans."**

This is his position between Guild Constraints and public enlightenment.

Anyone who brings something new must make some sacrifices for this cause, for without sacrifice, there is no victory for the truly called." - Dr E. Below, MD, Chief Physician of the Red Cross Light Therapy Institute, in "Archives for Light Therapy", March 1901.

Coloured Jewellery in its Hygienic-Therapeutic Action

"It is certain that Blue Glass interchanged with Red does good service at this day in Therapy.

The sunlight radiating through it, on the tumour causes a loosening effect under the Red glass, chemically dispersing under the Blue.

The ruby was credited with a good reaction on women's abdominal maladies.

In these days we see a similar effect from ruby glass rays.

To chrysolite was ascribed influence on secret nervous processes.

The scrofulous and those suffering from blood decomposition dared not wear blue jewellery, but copper buckles and such like were recommended, which were also said to be good for varix.

Many of On the "Utility" Phase of the Minor these assertions were verified by practitioners at a session of our Association for Light and Colour Investigation.

For the scrofulous and similar anaemic or prostrating conditions gems that excite, those having lively colours, are best.

The Effect on Epileptics of Dark Violet, and Purple Is Remarkable.

Many of them recover visibly by viewing such stones.

One of them affirmed the falling off of the attacks with looking at these colours, especially the Dark Violet, and I have, even in a medical Periodical and other Experts Papers, **Read Accounts of It.**

We should, therefore, make special Epileptic Rings and other Jewellery Articles. Red Stones with delicate blue outer edging attract attention to them, having diverting effect.

Our expert Director Koch, who, years ago, collaborated with **the noted French physician Professor Tissier, relates that the latter used a Kaleidoscope as the simplest cure (that never failed) for Nervous children suffering from Insomnia.**

The children had to look at the play of colour and form which diverted and soothed them.

Now, could not similar jewellery objects work in the same manner? Certainly!

Yellow has dissolving, separating action-the ancients say.

Yellow pearl jewels and belts should be applied to persons of languid disposition.

We know in these days, from the experiments of our physicians, liver and bowels and stomach are shaken up by radiations through Yellow glass, and often in surprisingly quick manner.

The ancients did not overshoot the mark much in this matter.

Radiating, diverting action was ascribed to Gold.

In fact, Gold Earrings also have often acted healthfully and usefully.

Gold coins, and chains worn on the breast assist in Asthma.

Several of our physicians acknowledge this.

We see that Ancient Wisdom and Modern Science Agreed.

One of our experts, the Colour Investigator, Michaelis, has given 20 years special study on Coloured Jewellery in its Hygienic-Therapeutic Action.

He can tell many interesting things about the colours.

Certainly this realm of research is not uninteresting, and we are ready to lend a hand for further carrying it along with our collected material." - Prof. Ewald Paul, in "Colour Mystics, and Jewellery", Pforzheimer Bijouterie - Zeitung, 1922.

Physical Effects & Biological Action of Light Energy Upon The Skin, Circulation, Nervous System & Metabolism

"The Physical Action of Light Energy:

When light of ordinary visible wave length strikes a molecule which is a very minute obstacle, the wave length is long by comparison with the molecule and goes smoothly on with but little absorption, or else, is smoothly reflected with but little absorption; but **when Ultra-Violet Light is used, the wave length is sufficiently short to make the molecule, or molecule groups, interfere with, and break up the waves, more or less.**

This breaking up of waves, involves imparting energy to the molecules and possibly the disruption of molecules with that energy.

The higher the frequency of the oscillating light corpuscles, the more likely this is to occur.

Groups of molecules are much more likely to be affected than individual molecules, just as a disruptive action would be more marked from the impingement of waves of suitable length upon a group of persons than upon a single individual, that is, in the jostling and general shaking up to which they would be subjected.

The individual might be passed by as the individual molecule by the longer wave lengths.

It is possible that there may be some particular sympathetic resonance between atoms and light frequencies, as, for example, **between Oxygen Atoms and Ultra-Violet Light Frequencies.**

The following theories and facts are generally accepted throughout the scientific world today, and help to elucidate the problem of the action of vibratory energy.

All matter, whether organic or inorganic, is in a state of continual motion as regards its molecular or atomic structure.

William Bean in "A theory as to the Roentgen Ray Action upon Malignant Neoplasms", The Journal of Advanced Therapeutics, May 1902, regards as proof that **one form, at least, of molecular vibration is induced by an ethereal vibration.** The physician's conception of Light, should not be from the point of optics and concern the visual frequencies only, i.e., from and including the Red, to and including the Violet, but must embrace the invisible part of the spectrum also.

That mysterious region known as the Ultra-Violet is of equal interest to the Physicist and Physician, as is also the invisible region below the Red.

The visible contains much heat, the energy called light, is after all very small.

It is an established scientific fact that, **many chemical actions will not take place until a certain temperature is reached, which means the attainment of a certain molecular vibration period.**

Others again may be brought about by exposure to light, which may or may not change the temperature, but which manifestly must have influenced the molecular vibrations.

This action is shown to vary with the different parts of the spectrum.

Photobiology has established, for example, a Bactericidal action for the middle third of the Ultra-Violet region, the ability to excite tissue reaction also to the Ultra-Violet, but the exact locality not determined; **a quieting action upon the Nervous System to the Blue frequencies, and apparently an increase of muscular power under their influence.**

There is also apparently **an Exciting or Stimulating Action Upon the Nervous System from the frequencies of the Red region.**

These varying effects are due to the varying wave lengths or the varying frequencies of vibration. From the action of a complex of all of the frequencies, there is an influence upon molecular activity.

In considering the phenomena of the vibrations of sound, and the laws governing it, it is well known that to produce a musical note, it is necessary either to strike the body capable of giving it out, or to have it placed where it may receive the influence of another vibrating body.

For this latter effect, however, the vibrating body, must be of the same pitch or an even multiple of it, and the vigour of the response depends for one factor upon the approach of that multiple to unity. **William H. Bean, advanced the theory that, a restorative change might be established in a pathologic cell-like cancer cell, for example, by which instead of being destroyed, its character may become so altered that it becomes again a normal cell.**

Such a change he attributed to the action of the Roentgen Ray.

A single X Ray impulse is in every respect an ultraviolet light frequency, but there the similarity ends, for the oscillating corpuscles of Ultra-Violet light are rhythmic and continuous, while the X Ray is a discontinuous, infrequent and solitary pulse.

The proper atomic motion of a cell, for example, should be stimulated by being in synchronism with an ethereal vibration, whose period of vibration is the same or a multiple of it. In this way, not only groups of molecules but single molecules should be affected.

In the longer and slower frequencies, as represented by visible light, are unquestionably to be found the periods of vibrational activity necessary to the maintenance of the living organism in a condition of normal health and function, but when it comes to be a question of diseased processes, a tubercular gland, a lupus patch, an organized exudate, associated with beginning degenerative changes, a sepsis, a syphilitic lesion, it seems necessary, judging from a knowledge of physical laws and physiologic action, as well as clinical results, to have the periods of vibrational activity not only that of groups of molecules, but also in sympathetic resonance with the periods of individual molecules or atoms.

The author believes that, the action of condensed light, of which Ultra-Violet frequencies are active constituents, in diseases characterized by deficient oxidation, the sub-catabolic Diseases of Wakefield, is to be accounted for on physical grounds by the fact that **there is a Sympathetic Resonance between the Vibrational activity of the Oxygen of the Blood and the periods of Ultra-Violet frequencies.**

It has been established by Cornu, that the Ultra-Violet frequencies from the Sun are absorbed not by the varying constituents of the atmosphere, such as the watery vapour, but essentially by the Oxygen and the nitrogen of the air.

The swing of the oscillating corpuscles of the penetrant chemical frequencies have either the same periodicity or rate of vibrational activity as an oxygen atom, or are a near multiple of the normal atomic action.

In other words they are in Sympathetic Resonance.

It does not seem to admit of question but that the essential principle of chemical action and vital activity, viz., Motion, Molecular or Atomic, is One and the Same Thing.

The molecules of a body, either inorganic, organic or protoplasmic, have a motion dependent upon ethereal vibration, and that the Atomic constituents of the molecules of these substances or bodies have a rate of vibrational activity or motion peculiar to the molecule to which they belong, then it follows that this rate of vibrational activity or atomic motion must be influenced by the right kind of vibrational activity of the Ether.

The range of this vibrational activity must be compatible with the integrity of the molecule itself.

The breaking up of the higher frequency of the oscillating light corpuscles, as they encounter the swing of the oscillating atoms or molecules, results in an impartation of energy to the molecule, or there may be a disruption of the molecule as the result of that impartation of energy.

Light Waves represent definite periods of vibrational activity.

They sustain every activity on earth, and alone keep up life.

The analgesia, which is produced by the concentrated, visible chemical frequencies of light, may be induced by a continuous, harmonious vibration, which, judging from effect, has served to tetanize as it were, and exhaust the motility of peripheral nerve elements.

From the physical properties of light energy, and its physical action upon a body endowed with a vito-chemical constitution, as is the living organism, follow chemical, osmotic, and molecular changes or physiological action.

So far as the chemical end of the spectrum is concerned, this physical action seems a rational one.

But for that matter all the visible frequencies are chemical as well as the invisible beyond the violet, and the same is true at the other end of the spectrum.

It is only that certain frequencies, i.e., from the Blue and above, are more intensely active in this way in relation to the living organism, at least so far as known. In normal conditions of the living organism, the higher chemical frequencies as used therapeutically in concentrated light energy, are not essential, but only active as they exist in diffused sunlight.

When physical conditions, as they relate to light and atmosphere, render them intensely active, and when the conditions of the living organism render it especially vulnerable, i.e., in conditions of more or less depressed vitality, untoward results follow.

There is some evidence also that **in prolonged unbroken periods of sunshine, with atmospheric conditions favourable to more than normal diffusion of the chemical frequencies, i.e., less active absorption before reaching the earth's surface, that nerve and mental states, where predisposition exists, are profoundly and unfavourably influenced. In an experience extending over 10 years among the insane, it was a matter of common observation, that an untoward influence was exerted over the mental state of patients under these physical conditions. In addition the greater prevalence of both suicide and homicide, has been noted by the author over a period of 30 years, as well as by others, during the prevalence of such physical conditions.**

Light Energy causes contraction of protoplasm, and acts directly upon the blood, increasing thereby its oxygenating power.

The periodicity of the vibrational activity of the higher light frequencies and their periodical relation to the vibrational activity of Oxygen atoms, and also the fluorescence of the blood and of the lymph serum, furnish abundant supporting and corroborative evidence of the physical and physiological action of light energy.

This is further substantiated by the intimate relation existing between the normal organism and light energy, as well as by a very considerable experimental work and clinical data.

The waves of Red Light measured by the amount of energy they carry, are immensely more powerful than the waves of Blue.

Under proper conditions the Green, Red and Infra-Red frequencies will all produce photographic action.

A proof of the chemical action of the Red frequencies can be had in the ability to photograph through the human body.

The Influence of Coloured Light upon the Nervous System

It has long been a matter of common observation that Different Colours Produce Definite Effects Upon the Senses and Feelings.

And it is also evident from many biological facts that Light Has A Powerful Influence Upon the Nervous System and the Organs of Sense.

Red is always spoken of as a warm colour; Blue as a cold colour; Yellow as a cheerful colour; Green as a restful colour.

This indicates a Reflex Effect Upon the Nerves.

The effect of Light Energy is not only seen in the action upon the Nervous Organs, but upon the Mental State as well.

There are also many phenomena and modifications of vital functions which arise from its indirect action.

In the "Undecaying radiance of the Sun man takes great delight."

There is no natural phenomenon which produces so profound an effect upon the mind of man and his consciousness as light.

"The royal Sun feedeth all", but it is not only physical food, but mental as well. Under the transition from darkness to light the stimulation of the mental power is greater than from any other form of energy.

The withdrawal of this stimulus or reversion to darkness has the opposite effect.

The experiments of Finsen show that **Ultra-Violet rays act as a vigorous irritant to the Nerve System and that by them skin reflexes are increased.**

Schmidt, Rampler, and Ponct, are quoted as authorities for the statement that **Psychical Disturbances even to actual Delirium, have been observed in the Eye Hospitals, where patients have been forced to live for a long time in the dark.**

Cases of different Psychoses, following Operations upon the Eyes, are recorded by Frankt-Ffochwart, Landersberg and Elschning.

Numerous experiments were made by the physiologist de Parville with the different parts of the spectrum.

These experiments, referred to constantly in the literature of photobiology, convincingly show that the **Red Frequencies act as excitants to the Nerves.**

The recent experiments of Pansini point in the same direction.

De Parville's experiments demonstrated **a calming effect from the other end of the spectrum, attributed to the Green, Blue and Violet Frequencies.**

Another physiologist has produced sensations of faintness by exposure to Red light, and afterward the symptoms have been removed by exposure to the conjoined Red, and Green frequencies.

In a large photographic plate manufactory, it was noted that **a change of colour in the light of the workroom from Red to Green acted to materially modify the excitability of the workmen.**

They were singularly lively over their work, singing, arguing loudly and gesticulating vehemently. They became much quieter after the change.

Goethe in his “Farbenlehre”, or in his “Theory of Colours” **called attention to the connection between colours and certain emotions.**

He observed that Red and Yellow light energy exercised a bracing effect, while Green and Blue were depressing.

The observations of Baron Reichenbach were to the same effect.

Akopenko, who worked in the laboratory of Bechtrew, proved that the duration of psychical processes is unquestionably affected by the energy of the different parts of the spectrum.

A more invigorating and stimulating effect is noted from the effects of the colours nearest to the heat rays.

The mood of the person under observation is affected; in Red light he feels brisk and cheerful, inclined to move and act.

In my own hospital wards, I have always considered the Sun porch as the Most Important of All the Means of Cure.

Every tubercular joint confined to bed, either with horizontal extension or with fixation or traction of joint, **spends the entire day at all seasons lying directly in the Sunshine, his eyes and head being protected by a Green Shade attached to the head of the bed.**

The effect on health, appetite and cell resistance is simply marvellous.

When able to walk about, patients are **encouraged to play in the Sunshine**, not in the shade. I have not infrequently sent out into the **sunlight, and fresh air** apparently hopeless cases of joint disease with lardaceous organs, and **have had them return with sinuses healed, waxy changes arrested and health restored.**

Of course, it is necessary that surrounding conditions, even in the country, shall be healthful, since many farmhouses are unsanitary in the extreme.

In the Treatment of Tuberculosis of the joints not only are mechanical and operative measures necessary, but all the accessory conditions of health are essential: a superabundance of easily digested and nutritious food, and clothing adapted to the surrounding conditions, in addition to the sunshine and air.

There are few individuals who have not observed the influence of darkness and poverty and vice on the general health, and yet **few physicians realize the importance of securing the brighter and better conditions.**

The time is near at hand when Sanatoria for the treatment of tuberculosis of the hard parts, as well as those of the soft tissues, will be established.

Outdoor life in tents, either in the pine forests or in the hospital grounds, promises a simple practical application of the principles enumerated.

Cheeks will grow more rosy, flesh will increase, energy will improve, and resistive power will speedily be such as to control and overcome the tubercle-bacilli.

McKenzie and Galloway have also adopted this most excellent principle of treating cases of tuberculosis of joints in the open air by having them live in tents, thus giving patients all **the advantages of sunshine and fresh air that are now in vogue in the Lung Tuberculosis Sanatoria.**

The appetite is greatly improved under such conditions; more food is taken, and it is better digested.

If waves of light strike a growing plant they do work; and to this end are absorbed all above the Green.

The Red medium of the blood, with its magnitude of function, upon which life depends, cannot, according to physical laws, be an exception to the law of light absorption; a law which has been abundantly proven by experimental work and clinical observation.

The absorption of light energy by the living organism is one of great import, and by it the writer believes is to be found the key to read the letters of life.

An exhibition of electric arc light energy has not only yielded good results at the author's hands in tuberculosis of the lungs but in all diseased condition of the respiratory mucous membrane which have offered themselves for treatment.

Among these Conditions may be mentioned:

1. **Chronic Bronchitis.**
2. **Bronchial Asthma.**
3. **Convalescence from la grippe.**
4. **Broncho-pneumonia (characterized by constant harassing cough and profound exhaustion).**
5. **Hay Asthma.**
6. **Acute Catarrhal Colds.**

In the Treatment of All Diseases of the Respiratory System, as well as in catarrhal conditions of the nasal passages, there have been secured certain definite and invariable results: viz., Improved Respiration, fuller and slower, with gradually increasing respiratory capacity; Diminished Irritability of the mucous membranes, and Lessened Discharge. Improvement from the harassing cough has invariably been noted from the first exposure.

In acute catarrhal colds with sneezing and coryza, exposure to the light energy of the arc uniformly results in complete control at the time of these manifestations. If the condition be taken sufficiently early its further progress is arrested. **Moeller showed that in radiant energy baths, the heat rays readily penetrate even bones.**

The penetrating light rays below the Blue, i.e., the Red, Yellow and Green, considered in relation to molecular activity would seem, by reason of their length frequency and amplitude of oscillation, incapable of exciting chemical action.

They doubtless undergo transformation into heat in the deeper structures.

This action may readily influence excessive perspiration and excessive drainage of the deeper tissues. It is in turn followed by marked sedation, which can readily be accounted for by the sudden and intense drainage through the skin of the accumulated products of the disturbed chemico-vital action of the system.

The Action of Incandescent Light Energy in Health

The action of these Baths was studied by E. Rosen upon healthy men.

Following a series of 12 of these **Radiant Heat Baths, a marked Improvement of Appetite, and Sleep was noted.**

There was also a gain in weight.

These favourable changes seemed to be lasting.

There was now a numerical increase, now a diminution of the cells according to Rosen.

Therapeutic Indications for an Expenditure of Incandescent Light Energy

Incandescent Light Baths Have Been Found Useful In:

1. Lowered Nutrition; The acid dyscrasias, rachitis, osteomalacea,
2. Lipogenous (also called adipogenous; adipos fat) Dyscrasias; Obesity, biliary lithiasis, gravel, diabetes, arthritic manifestations of gout and rheumatism,
3. Alterations of the Blood State; Anaemia, chlorosis, lymphostasis, syphilis,
4. Nervous Conditions; tabes, neuralgias, hysteria, psychoses,
5. Respiratory & Circulatory Conditions; Bronchitis, bronchial asthma, cardiac hypertrophy,
6. Diseases of the kidneys; Nephritis,
7. Surgical Conditions; Chronic Tubercular Ulcers, inflammatory diseases of bones, chronic leg ulcers, paralysis and trophic disorders,
8. Toxaemias; Alcohol, drug and metallic poisoning;
9. As a Hygienic Measure.

In some of these conditions, they form the remedy par excellence, in others an exhibition of a light energy more profoundly chemical in its action, is indicated, i.e., Solar Light or Electric Arc Light Energy.

The Therapeutic Effects of Incandescent Light Energy

There is established by the action of these Baths a profound action on the Vaso-dilators of the arteries. By the stimulation imparted to them the blood is permitted to flow more rapidly to the surface. In this way the heart is relieved of its burden, and, at the same time, the constriction to the arterial circulation and the capillaries is also lessened. From this action there ensues lowered tension of the blood stream with an increase in its volume and uniformity. A marked effect upon sensory centres is noted, as is evidenced by a diminution of nerve irritation and debility." - in "Light Energy, its Physics, Physiological Action, and Therapeutic Applications", 1904.

How to choose the Colour, or Colours required for the Treatment of a particular Condition

"Considering the fact that a cell is composed of molecules, molecules are made up of atoms which in turn contain electrons, protons, etc., we come down to the original substance which in its final analysis ceases to be material but should be rather considered as a "state of energy," and since all bodies are made up of such Electro-Magnetic Cells, the human organism must be also an Electro-Magnetic Dynamo. Observing the electro-magnetic currents of cellular elements we find that as soon as they become disturbed a change of polarity takes place and the chemistry of the blood and colloids assumes a new quality. When such depolarized cells are subjected to a microscopic examination they reveal that this disturbance of polarity causes not only a change of bio-chemical qualities in the constituent elements, but that it alters the size and position of the cell's nucleus and transforms completely even the cell itself, developing cellular structures of a foreign type and entirely different "tensile strength," in the sense that such new tissues, when subjected to the stimuli of light and colour, respond quite differently than the normal tissues of a healthy body, their resistance being either lowered or increased. **Health or wholeness of a body is essentially a biological condition, manifesting objectively as the vital potency or "tune" of a being.**

After a period of more than 20 years of research and experimenting with light and colour upon living organisms, I have discovered a fact of extreme importance, namely that the properties of the various rays must be divided into 2 potencies:

1. **Biological.**
2. **Pathological.**

In other words, that it is impossible to use freely a whole range of any colour, for biological or curative purposes, without controlling the proportion of its intensity and quantity. Each colour contains within its scale not only the healing and life-giving quality, but also a death-dealing potency.

I found that the properties contained within differ in quality and potency at various points, giving either a biological, that is, life-promoting reaction, or a pathological and lethal one. Extending those tests to the whole spectrum from Ultra-Violet, to the Infra-Red end, I discovered that every portion contains those two potencies at various intervals, but that those intervals do not alternate in a sequence but register at various points of the scale.

Further analyses have proved that this variation is due to the change of refraction.

Ultimate results have proved that; each colour has a specific function to perform in the development of normal life, and that, this life-promoting, or biological potency, is contained within a particular range of intensity correlated to certain elements contained within the protoplasm, and which under the stimuli of that colour become actively potent.

A rightly timed exposure will produce a slight rise of temperature sufficient to increase the molecular tension without altering the structural integrity of the cells, promoting metabolic activities and physiological functions.

An overdose of such an exposure will on the contrary raise the temperature of the protoplasmic substance beyond its normal state, disturbing thereby, or even destroying, cellular structures and manifesting objectively as a feeling of depletion, enervation, irritation, etc.

The reactions to light are not always the same, some colours produce sedative or even depressing effects, due to a process of inhibition; for example, radiations located between 4,000 to about 5,000 A.U. when rightly used have a highly stimulating influence on micro-organisms, promoting cellular multiplication and speeding up chemical reactions: if, however, the exposure is too extreme, protoplasmic activities become suddenly suspended, cells begin to shrink, contract and gradually a complete inhibition of functions takes place, followed by an encystment or even death.

All cellular activities run in cycles, and it is due to this fact that the reactions which take place within the human body during a treatment with light are so rapid and potent. Rhythm is the basic expression of all physiological functions, and just as the whole organism performs certain rhythmic actions such as the contraction and expansion of the heart or the inhalation and exhalation of air, so also each individual cell goes through various cyclic motions recurring rhythmically at various intervals.

Time is therefore an Important Factor in Colour-Therapy; because it is the cumulative effect of impulses that produces results and unless the exposure is rightly timed, even the use of a correctly chosen colour may become injurious if it brings the molecular tension to its pitch.

It must be always remembered that it is not the quantity of a stimulus which counts but its quality, and the cumulative effect of repeated impulses.

Since the human body is essentially a community of cells, a cumulative potency of rightly chosen and repeated irradiations will produce much more effective and more lasting results than a short exposure to an intense illumination.

Intensity relates chiefly to heat and distance, that is, a strong illumination will cover a larger area and produce more warmth, there will be more light in quantity of radiations but not in their quality, therefore the source of light should be always chosen and adjusted relatively to the effects which we wish to produce.

In general Colour Treatment should last from 20 to 30 minutes, considering the fact that since protoplasmic reactions run in cycles, an exposure of 30 minutes will produce a sufficient amount of effective impulses to establish a vital rhythm within the organism. It is obvious that each colour has a specific function to perform in the development of life, because it corresponds to certain elements active within the protoplasm; we see, therefore, that short rays, that is, those relating to the Blue-Violet end of the spectrum, promote photosynthesis, activate the circulation of the sap and encourage growth, stabilizing and controlling at the same time the Stimulating Effects of other agents such as: Water, Air, etc... It is a well-known fact that the awakening of vegetable life always takes place in the early months of the year when short rays are the most active, influencing even the growth of potted plants.

Seeds always begin to germinate in the first hours around sunrise; juices and the fluid parts of the plant are most concentrated at that time and the etheric oils contain their highest quality just before sunrise; it is known, for example, **that the picking of flowers for the purpose of extracting their essential oils is always conducted at those early hours of the day.**

The middle part of the spectrum where the green potency predominates is most important in the development of stems, leaves, fibres and cellulose.

It is also during the month of June that the fleshy parts of vegetable anatomy reach their full growth and that foliage and grasses are most abundant.

The yellow potency of light induces the maturing of flowers; blossoms display their fullest development from June to August, as well as around the early afternoon hours of the day. As the longer end of the spectrum comes more into power the time for the ripening of fruits and seeds is at hand, and it is the orange and red radiations which contribute their share in the production of a complete organism. Time and Place are thus the 2 great factors in physical life, everything that happens within the universe is subject to their law and carries within its nature the stamp of their action. The more complex the organism the more difficult it is to follow the subtle reactions affecting the protoplasm, but even as we turn to man it is not impossible to observe the important part played by the various parts of the spectrum in influencing the growth and development of life.

In the healing arts it is already a well-known fact that light and colours exert a very definite action from the therapeutic point of view. In the course of my experiments I have made another important discovery pertaining to one particular type of radiations which always sustain a harmonious balance of light even when used alone. This biological energy is located within the central portion of the visible spectrum, and spectroscopic examinations have proved that it contains the complete biological range of all colours, extending even to the Ultra-Violet and Infra-Red.

Extremely interesting reactions have been observed using those radiations in a condensed strength, focusing them with lenses upon infusoria. Adult cells which had already reached the stage of maturity have been activated to a rapid division, followed by an early inhibition of their vital processes.

In young cells, which had not yet reached the stage of reproduction, the life cycle has been speeded up by shortening the period between birth and death before they had time to multiply, arresting thus the progress of further reproduction.

The healing effects produced by light and colours are undoubtedly due to its direct action upon the protoplasm, and the speed and subtlety of reactions are proportional to the biological condition of the organism.

The Curative Power of Chromo-Therapy Resides In Its Selective Property of Penetration, but what that penetration actually is or how it operates within the body is still a matter of little understanding even to some of those who use and apply the various methods and modalities.

All physical bodies are made up of Electro-Magnetic Points of Energy or "elements" in their most subtle state of rarefication; health of a body is a proof of their "ionic equilibrium" and the maintenance of that equilibrium depends on a harmonious and rhythmic circulation of that dynamic energy. In order to understand fully the actual significance of that process it is absolutely imperative to establish a definite conception as to what the nature of active energy is and how it is related to a physical body.

Energy: be it Electricity, Magnetism, Light, Colour, or what not, must possess a certain degree of substantiality in order to produce an impression.

Colour Is Vibration, and since Vibration is a sign of a "molecular tension", it is easy to understand that; The Application of Light and Colour to the Body for Therapeutic Purposes Must Produce a Relative Molecular Reaction.

We must always remember that: Light is not something separate from us, something outside of us, but that it is the Same Energy which enters into the composition of every single cell of our body, and which holds our physical structure in perfect equilibrium.

In studying the subject of Light and Colour, in relation to Life it is therefore absolutely essential to recognize and understand that there is a law of Spectro-Biological correspondence which binds all aspects of manifested existence into one integral whole.

Light Is The Basic Biological Agent intended by Nature for the preservation of health and life, and in giving out the little knowledge and experience which I have gained in that field, **I sincerely hope and wish that this little book will help to utilize that great cosmic biological energy for the service and benefit of humanity."** - Countess Maryla de Chrapowicki, D.Psy., in "Spectro-Biology; Light and Colour Therapy", 1938.

"The Law of Life Is Motion, a rhythmic cyclic pulsation of radiant energy which always tends to preserve and restore balance and harmony, its measured periodic vibrations throbbing through space complete with every beat, a minor cycle within the major wave of the great cycle of evolution. As this rhythmic factor becomes more, and more evident, so does man begin to notice the unfoldment of an intricate pattern of radioactive substances which act as a bridge between the tangible and the intangible or tenuous states of life, and this bridge reveals a synthetic Unity of Mind and Body. Life is a manifestation of a ceaseless exchange between various degrees of matter. The character of the energy implanted in the body during that activity is, above all, ionic before it becomes molecular, for it proceeds from the sphere of radiation. But man perceives only the secondary physical effects, those which manifest on the plane of matter and which are recognized as molecular activity." *- Countess Maryla De Chrapowicki, D.Psy., in "Biotonic Therapy; Therapeutic Use of Life Energy", 1952.*

The Physical Action of Light Energy

"It is possible that there may be some particular sympathetic resonance between atoms and light frequencies, as, for example, between oxygen atoms and ultra-violet light frequencies. The following theories and facts are generally accepted throughout the scientific world to-day, and help to elucidate the problem of the action of vibratory energy. All matter, whether organic or inorganic, is in a state of continual motion as regards its molecular or atomic structure. As we go up or down the scale this motion increases or decreases as we go up or down the temperature scale, until it theoretically ceases at absolute zero. The motion is vibratory and depends, so far as its changes are concerned, upon the vibrations in the radiant energy acting upon the body of which the molecules are constituents. When the vibration is of sufficiently high frequency, the molecules break down into simpler forms, and the more complex the molecule, the lower is the frequency of vibration necessary to produce this result. In the ethereal vibration of radiant energy, the temperature of the body is raised. This William H. Bean ("A theory as to the Roentgen Ray Action upon Malignant Neoplasms", Advanced Therapeutics, May 1902), regards as proof that one form, at least, of molecular vibration is induced by an ethereal vibration. The physician's conception of light should not be from the point of optics and concern the visual frequencies only, i.e., from and including the red, to and including the violet, but must embrace the invisible part of the spectrum also. That mysterious region known as the ultra-violet is of equal interest to the physicist and physician, as is also the invisible region below the red." - Dr Dr. Margaret A. Cleaves, MD, in "Light Energy: Its Physics, Physiological Action and Therapeutic Applications", 1904.

All Matter Is In a State of Continual Motion

"All matter, organic and inorganic, is in a state of continual motion as regards its molecular or atomic structure, and this motion increases or decreases, as we go up or down the temperature scale, till it theoretically ceases at absolute zero.

The motion is vibratory and depends, so far as its changes are concerned, upon the variations in the Radiant Energy acting upon the body of which the molecules are constituents.

When the vibration is of sufficiently high frequency, the molecules break down into simpler forms, and the more complex the molecule the lower is the frequency of vibration necessary to produce this result.

Radiant Energy, or this means we have of raising the temperature of a body, is an Ethereal Vibration; consequently, one form at least of molecular vibration is governed by an Ethereal Vibration.

Light, in the ordinary use of the word, means the manifestations of those components of certain Ethereal Vibrations which go to make up that portion of the spectrum between and including Red and Violet; but here let us use it in its wider sense, meaning those Ethereal Vibrations which are propagated at right angles to the directions of their vibrations.

Now, while many chemical actions will not take place till a certain temperature is reached; i. e., certain molecular vibration period attained; many others can be brought about by exposure to light, which may or may not change the temperature, but which manifestly must have influenced the molecular vibrations.

This action differs in different parts of the Spectrum, but from the lowest end to the highest the variation is due only to the different wave lengths, or what amounts to the same thing, the variation in frequency of vibration.

Here we have another form of molecular activity influenced by another form of Ethereal Vibration.

In considering the phenomena and laws of sound we note that a body capable of giving out a musical note does so, not only when struck, but also in response to vibrations which come to it through the air from another vibrating body.

We know that all forms of life are favourably influenced by light and heat; consequently, we may infer that these factors contain some form of ethereal vibrations which are capable of eliciting a responsive atomic motion peculiar to the molecule of the cell in question, but possibly so far removed from its own period of motion that the response is feeble (compared with what we could imagine), yet quite sufficient for its ordinary maintenance." - William Hill Bean, in "A theory as to the Roentgen Ray Action upon Malignant Neoplasms", The Journal of Advanced Therapeutics, 1902.

The Cellular Effect and Benefit of Near-Infrared Wavelengths

"It affects us at the cellular level. It affects our mitochondria. It affects the energy production. It enhances the cell and the components in the cell to work more efficiently.

Neurologic Conditions

There are promising studies on neurodegenerative disorders:

1. Acute Ischemic Stroke.
2. Depression.
3. Anxiety.

It modulates Serotonin levels and Endorphins." - Dr Brooke Miller, MD

> ***"Melatonin is one of the most powerful Antioxidants in our cell, Near-Infrared Light Therapy will increase the ability of the cell to clear those Reactive Oxygen Species."*** *- Dr Ryan Cole, MD*

Important Clinical Advise on the Application of Light Therapy

1. Start Slowly: Begin with short sessions and assess tolerance.

2. Consistency Is Fundamental: Regular, shorter sessions often yield better results.

3. Holistic Approach: Combine red light therapy with diet, hydration, sleep, exercise, and grounding for optimal benefits. "This is just one of many things that you can do to enhance your health. But your diet, your exercise pattern, your sleep, your sunlight exposure, Vitamin D - nothing really takes the place of those." - Dr Brooke Miller, MD

There must be Consistency in the Activities of the body, not only in the Application of the Electrical Forces, but there must also be Consistency in the Manner of Life, and its Application of its Abilities Towards Constructive Forces or Influences.

Red Light Therapy Equipment

Appropriate Wavelengths:
Skin-level therapy: 660–670 nm
Joints, Muscles, and Deep Tissues therapy: 800–850 nm
Deeper Tissue and Neurological Conditions therapy: 1000+ nm
Adequate power density (milliwatts per square centimeter).
Minimal electromagnetic field (EMF) radiation exposure." - in "The Science Behind Red Light Therapy", Independent Medical Alliance, 12 June 2025

Chapter 7

The Foundation For Light Therapy

“The Foundation for Light Therapy”, Charitable, Non-Profit Scientific and Humanitarian Organization 501(C)(3), Florida, U.S.A., July 2000 to 2014.

The Foundation has Compiled Extensive Research, and Irrefutable Evidence of the Efficacy of Light (Light Energy) in various frequencies, intensities and modalities has the ability to destroy pathogens in the blood, specifically bacterial and fungal. **The purpose of the Foundation; is to be instrumental in the further development, experimentation and implementation of Light Therapy and Light Technologies. Foundation for Light Therapy will continue to enlist the expertise of medical professionals, institutions, organizations and specialists to help with these Promising Treatments.** Researchers have long suspected that the key to curing many illnesses lies within the human body itself.

This notion of **stimulating the body’s own immune system, as a weapon against diseases** has been with us for at least a century. The following information will help illustrate that through the years new, innovative ideas, which did not conform to the Medical Trade, thus have been overlooked, and intentionally suppressed. The focus of the Foundation has been to researcher and identify safe and effective alternative methods of disease prevention, treatments, and cures.

Utilising Oxygen and Light Therapy

Our Work Has Been Extremely Gratifying.

The Foundation has identified and successfully tested, proved, and improved the efficacy of Oxygen Therapies often referred to as “Oxidative Medicine”, and the associated delivery systems.

For over 100 years Oxygen Therapies has been referred to by many names in literature such as Photoluminescence, Ultraviolet Blood Irradiation (UVBI), Ultraviolet Light Therapy, Photopheresis, Bio-Photonics, Ozone and Hydrogen Peroxide. **Oxygen Therapies Are Effective and Inexpensive.**

These remarkable healing technique works by simulating the body’s immune system and has been especially effective against blood borne diseases.

It also has the added benefit of being able to resolve numerous infections simultaneously, without contributing to the increased incidence of negative drug interactions that are prevalent in current medical practice.

There are little or no documented side effects!

The Foundation has compiled compelling Evidence that Oxygen Therapies, Ultraviolet Light, Ozone, Hydrogen Peroxide, and other Treatment Therapies:

Are Efficacious.

Diseases that have been successfully treated with the Foundations Treatment Protocols include the following:

1. **So-Called "HIV/AIDS".**
2. **Tuberculosis.**
3. **Hepatitis C.**
4. **Upper Respiratory Diseases.**
5. **Chronic Fatigue Syndrome.**
6. **Diabetes.**
7. **Asthma.**
8. **So-Called "Human Papilloma "Virus".**
9. **Stomach and Intestinal Disorders.**
10. **Staph, and Blood Stream Infections.**
11. **Psoriasis.**
12. **Certain types of Cancers.**
13. **And a host of other diseases.**

Technological advances in electronics used in administering Ultra-Violet Treatments, and marked improvements made with photoactive substances have also elicited highly significant results, further development of these technologies can save millions of lives.

The Foundation has recently provided Oxygen, Light, and Oxidative Therapies in several African countries, and in the Dominican Republic.

The opportunity was given to demonstrate the effectiveness of these treatments.

The scientists and Foundation researchers who witnessed ongoing positive Treatment outcomes summarised the results as "highly promising".

Recipients of the treatments, and their significant others, often described the results as "miraculous" as health, and overall quality of life were restored quickly and inexpensively.

The Foundation will continue to enlist the expertise of medical professionals, institutions, organisations and specialists to help with these promising treatments.

The Foundation is attempting to facilitate the establishment of properly controlled clinical studies within the FDA protocols.

The Foundation will provide all current date regarding Oxygen and Oxidative Therapies, treatment devices and delivery systems including "Energy Medicine" such as lasers, topical bio-modulators and Electro-Magnetics.

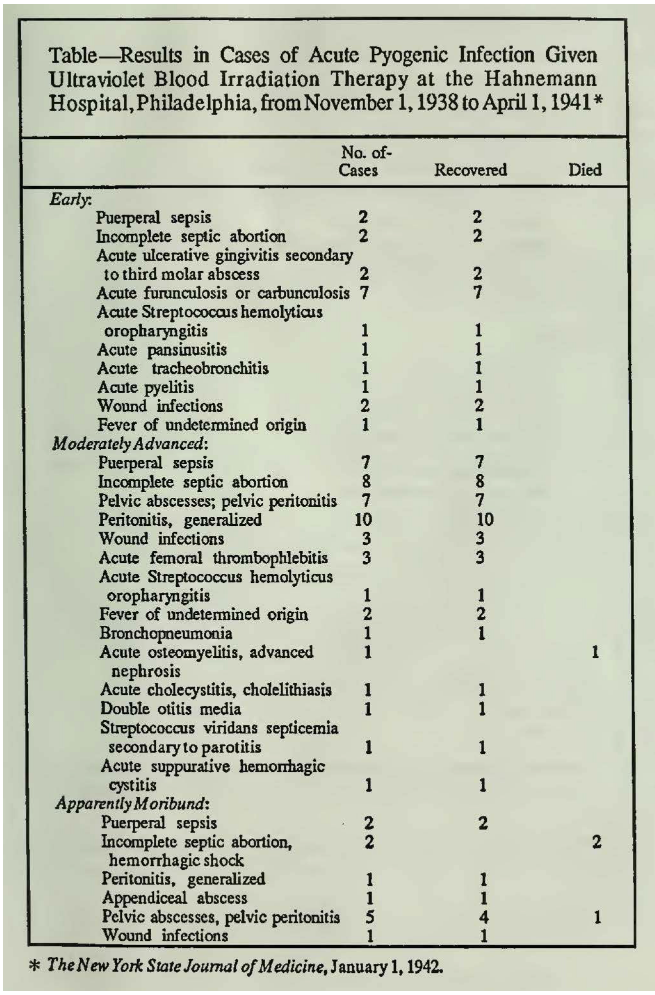
Ultra-Violet Light Therapy

1940

"Dr Henry A. Barrett, MD, Willard Parker Hospital, New York City, in 1940, Reported on 110 Cases including a number of Infections; **29 Different Conditions Responded Favourably to Ultraviolet Irradiation Blood Therapy:**

1. Arthritis.
2. Septic Abortion.
3. Osteoarthritis,
4. Tuberculosis Glands.
5. Chronic Blepharitis.
6. Mastoiditis.
7. Uveitis.
8. Furunculosis.
9. Chronic Paranasal Sinusitis.
10. Acne Vulgaris.
11. Secondary Enemia.
12. Etc...." - Dr H.A. Barrett, MD, in **"The Irradiation of Autotransfused Blood by Ultraviolet Spectral Energy.** Result of Therapy in 110 cases", Med. Clin. North America, 1940; **"Five Years Experience with Hemo-Irradiation according to the Knott Technic"**, American Journal of Surgery, 1943.

> *"**The Detoxification Effect of Ultraviolet** is generally not known by the medical profession. **The Inactivation of Snake Venoms, and Bacterial Toxins are examples of what may be accomplished by Ultraviolet.**" - Dr Miley, MD, in **"The Knott Technique of Ultraviolet Blood Irradiation in Acute Pyogenic Infections"**, New York State Journal of Medicine, 1 January 1942.*



Table—Results in Cases of Acute Pyogenic Infection Given Ultraviolet Blood Irradiation Therapy at the Hahnemann Hospital, Philadelphia, from November 1, 1938 to April 1, 1941*

	No. of-Cases	Recovered	Died
Early:			
Puerperal sepsis	2	2	
Incomplete septic abortion	2	2	
Acute ulcerative gingivitis secondary to third molar abscess	2	2	
Acute furunculosis or carbunculosis	7	7	
Acute Streptococcus hemolyticus oropharyngitis	1	1	
Acute pansinusitis	1	1	
Acute tracheobronchitis	1	1	
Acute pyelitis	1	1	
Wound infections	2	2	
Fever of undetermined origin	1	1	
Moderately Advanced:			
Puerperal sepsis	7	7	
Incomplete septic abortion	8	8	
Pelvic abscesses; pelvic peritonitis	7	7	
Peritonitis, generalized	10	10	
Wound infections	3	3	
Acute femoral thrombophlebitis	3	3	
Acute Streptococcus hemolyticus oropharyngitis	1	1	
Fever of undetermined origin	2	2	
Bronchopneumonia	1	1	
Acute osteomyelitis, advanced nephrosis	1		1
Acute cholecystitis, cholelithiasis	1	1	
Double otitis media	1	1	
Streptococcus viridans septicemia secondary to parotitis	1	1	
Acute suppurative hemorrhagic cystitis	1	1	
Apparently Moribund:			
Puerperal sepsis	2	2	
Incomplete septic abortion, hemorrhagic shock	2		2
Peritonitis, generalized	1	1	
Appendiceal abscess	1	1	
Pelvic abscesses, pelvic peritonitis	5	4	1
Wound infections	1	1

*"**Vasodilation has been observed to occur wherever Ultraviolet is used,** and has been reported by Balderrey and Barkus; T. Lewis, Krogh, Ellinger, and Kawaguchi." - in "The Hahnemannian Monthly", Vol. 77, 1942.*

*"**The Increase of Blood Irradiated with Ultraviolet to Absorb Oxygen has been demonstrated.**" - in "Journal of Nutrition", 1931; G. Miley, in "American Journal of Medical Science", 1939.*

	No. of Cases	Recovered	Died
Fever of undetermined origin	2	1	1
Lobar pneumonia	2	1	1
Bronchopneumonia	1	1	
Pyelonephritis, cystitis, secondary to bladder carcinoma	1		1
Rectal abscesses, cystitis, ileitis, advanced arteriosclerosis	1		1
Bacillus coli abscess of scrotum	1	1	
Streptococcus hemolyticus oropharyngitis complicating mastoidectomy	1	1	
Extensive trauma, terminal bronchopneumonia	1		1
Septicemias:			
Staphylococcus aureus	4		4
Staphlococcus albus secondary to Staphylococcus albus pneumonia	1		1
Streptococcus hemolyticus	2	2	
Streptococcus nonhemolyticus	2	1	1
Streptococcus viridans subacute bacterial endocarditis	4		4
Streptococcus nonhemolyticus endocarditis	1		1

Summary:

	Early	Moderately Advanced	Apparently Moribund
Number of cases	20	47	36
Number recovered	20	46	17
Percentage recovered	100	98	47
Number died	0	1	19
Percentage died	0	2	53

All of the patients in the *apparently moribund* group were probably on sulfa therapy, which renders photoluminescence ineffective.

New York State Journal of Medicine, 1 January 1942

1947

"Continued work in the **Treatment of Sulfa Drug Failures,** has greatly strengthened our original belief that **Sulfa sensitive infections are easily and favourably influenced by Ultraviolet Blood Irradiation Therapy**, and that **a large variety of infections not controlled by Sulfa Drugs can be rapidly and efficiently controlled by Ultraviolet Blood Irradiation Therapy.**

In 60 cases of Sulfa Drug Failures, Ultraviolet Blood Irradiation Therapy Was Found Successful in controlling the acute infection in most instances acute infections, were found, when treated by Sulfa Drugs, to be either uninfluenced or, as occurred in a majority of cases, the infection was believed to have spread more rapidly than ever following the use of Sulfa Drugs. This was in sharp contrast to the rapid subsidence of such infections when treated with Ultraviolet Blood Irradiation Therapy alone or after Sulfa Drug failure. It is our **carefully considered opinion that, in the treatment of most acute pyogenic infections, Ultraviolet Blood Irradiation Therapy is a far safer and Much More Efficient Method of Treatment than is Chemo-Therapy with Sulfa Drugs.**

> ***"As a rule, rather low dosages of externally applied Ultraviolet Radiations Stimulate The General Resistance To Infection."*** *- in* ***"Ultraviolet Radiation and Resistance to Infection"****, Copenhagen, Congres. Internat. Lum., 1932.*

Treatment of Penicillin-Resistant Infections

In Penicillin-Resistant Cases, we have found that Ultraviolet Blood Irradiation Therapy is a valuable therapeutic agent, when used to control penicillin-resistant infections. The chief penicillin-resistant infections in which we have used Ultraviolet Blood Irradiation Therapy to control the infection have been those due to Streptococcus Hemolyticus, and Colon Bacillus.

As a result of our experience in the use of Ultraviolet Blood Irradiation Therapy in penicillin resistant cases, we have been able to make the following pertinent observations:

1. As might be expected, patients who have received penicillin without effect do not come to us as a rule with the profound Toxemia, that is so uniformly present in Sulfa Drug Failures. **Since No Extra Toxic burden has been added to the patient by the drug used, More Can Be Expected From the use of Ultraviolet Blood Irradiation Therapy in pure penicillin resistant failures,** than in Sulfa Drug failures, provided that patient is not first seen in a hopelessly moribund state.

2. **There is no contraindication to the combination or synchronized use of penicillin with ultraviolet blood irradiation therapy,** as is the case with Sulfa Drugs. Penicillin can be given safely before, during or immediately after ultraviolet blood irradiation therapy, since there is no photosensitization factor to be considered

3. **Inasmuch as Ultraviolet Blood Irradiation Therapy controls certain infections rapidly and efficiently, and penicillin does not, Ultra Violet Blood Irradiation Therapy must be considered the procedure of choice in these infections.**

4. **The rapid and favourable response of Staphylococcus Septicemia to either Ultraviolet Blood Irradiation Therapy** or penicillin used independently of the other, plus the lack of contraindication to a combined use of both agents, suggests that the ideal treatment for all severe Staphylococcic Infections is the combined treatment of the infection, using both ultraviolet blood irradiation therapy and penicillin simultaneously.

5. **Ultraviolet Blood Irradiation Therapy by its very non-specificity has many advantages over penicillin in that it provides safe, rapid and efficient control of acute fulminating infections, regardless of whether or not such infections are due to penicillin sensitive bacteria.**

Blood Irradiation Alone in Acute Infections

1. Ultraviolet Blood Irradiation Therapy used alone is the ideal method of controlling acute bacterial infections either of an acute pyogenic nature.

2. It is a safe, reliable and non-specific method of controlling acute infections.

3. It insures adequate ultraviolet intake to those whose protective immunological reactions are in the process of deterioration. **This deterioration, even when progressing rapidly, has been observed to be reversed in a definite manner following ultraviolet blood irradiation therapy, resulting in consistent clinical improvement.**

4. A marked decrease in hospitalization time for such infections has been observed by us as well as other workers in the field following the use of this method.

5. When Blood Irradiation was used in the Acute Infections, the use of sulfa drugs or penicillin was believed to be entirely unnecessary, with the possible simultaneous use of penicillin in Staphylococcus Septicemia and the absolute use of penicillin in Bacterial Endocarditis.

6. The detoxification effect originally reported to occur 24 to 48 hours after the use of Ultraviolet Blood Irradiation Therapy in Acute Pyogenic Infections was also noted after its use in Infections. This finding has also been recorded by Barger and Newman, in Acute Bulbar Poliomyelitis patients following Ultraviolet Blood Irradiation Therapy.

The Use of Ultra Violet Blood Irradiation Therapy Before Operation Preoperative Protective or Rebbeck Effect

Rebbeck originally described the occurrence of a powerful preoperative effect following **The Use of Ultra Violet Blood Irradiation Therapy Before Operation**, i.e., uterine dilatation and curettage in cases of incomplete septic abortion. We have repeated this work in 26 consecutive cases, and can definitely confirm this original report of Rebbeck's. **We have likewise found that one may remove with impunity infected teeth, and tonsils in the face of an acute rheumatic process with, or without associated myocardial damage. The tremendous potentialities for preoperative protection should be obvious to both surgeon and internist who are constantly faced with the well known dilemna of the poor surgical risk patient with dangerous foci of infection producing or aggravating the chief disease process**. It seems to us that Rebbeck's contribution to safer surgery is most important; furthermore, his preoperative protective effect has been confirmed by others besides ourselves, notably Hancock, Moser, Olney and Barrett.

Case Report

Case 1. A female, 54, admitted to Hahnemann Hospital, Philadelphia, Pennsylvania 5 July 1942: Complaining of a severe pain in the right side and a full burning sensation in the rectum.

On 3 August 1942, her temperature rose to 104.2°F. The patient was sigmoidoscoped and a large amount of pus drained from an abscess at the rectosigmoid junction. 6 August, was apparently moribund with Cheyne-Stokes respiration, showing a rapidly falling blood count, temperature of 104°F, **increasing Toxemia and a rapid spread of the infection. The patient was semi-comatose, anuric, edematous and in early shock.**

Her extremely toxic condition was believed to be due to 2 factors:

1. Overwhelming Toxemia of Bacterial Infection,
2. The toxic effects of sulfathiazole, which failed to control infection.

Ultraviolet Blood Irradiation Therapy with 200 cc. of citrated blood was given, and Sulfa Drugs were stopped; the patient's condition improved with supportive fluids and blood transfusions during the next 48 hours.

Her temperature dropped to a level of 101°F to 102°F.

The toxic condition subsided slightly and the patient was more rational, taking some food and voiding normally for the first time in more than a week.

On 10 August 1942 a second Ultraviolet Blood Irradiation with 275 cc. of citrated blood was given after which the patient's temperature receded to nearly normal with a marked improvement in her general condition.

The white count rose to 11,700 from the pre-irradiation value of 6,000.

The patient now had normal bowel movements, ate well and regained strength.

Rectal examination produced no more pus, but a mass in the sigmoid could still be felt.

On 19 August, the patient's temperature, pulse and respiration rose to 102°F, 130, 38 respectively and her condition deteriorated somewhat.

The white blood count was 9,600.

Another Ultraviolet Blood Irradiation of 275cc. of citrated blood was given to which the patient responded in 48 hours with a normal temperature, a subsidence of toxic symptoms, lowered pulse and respiratory rate to 100 and 20 respectively.

The diagnosis was para-rectal abscess, and perforation of sigmoid diverticulum with abscess formation, rapid spread of infection.

The patient made an uneventful recovery and was discharged 2 weeks later, on 2 September 1942, in apparently good condition.

Summary

1. **The study of the clinical effects of Ultraviolet Blood Irradiation in 445 consecutive,** and unselected cases of acute pyogenic infections has been made. Confirmation of our original preliminary findings was observed. **These findings showed that Ultraviolet Blood Irradiation Therapy Was a Rapid, Efficient and non-specific control of all types of acute pyogenic infections** (except bacterial endocarditis), **the use of which was characterized by a quick subsidence of toxic symptoms, a disappearance of bacterial proliferation and invasion and an uneventful convalescence.**

2. In 74 consecutive and unselected cases of infections we have observed results comparable to the favourable effects observed in its use in acute pyogenic infections.

3. **It was found that Sulfa sensitive infections are easily and favourably influenced by Ultraviolet Blood Irradiation Therapy, and that a large variety of infections not controlled by Sulfa Drugs can be rapidly and efficiently controlled by Ultraviolet Blood Irradiation Therapy.**

4. **Many penicillin-resistant infections Respond Favourably to Ultraviolet Blood Irradiation Therapy, both the acute pyogenic types and infections.**

5. **We were able to confirm the preoperative protective effect of ultraviolet blood irradiation therapy described by Rebbeck and fittingly called the Rebbeck Effect.**

6. There is no contraindication to the joint use of penicillin and Ultraviolet Blood Irradiation Therapy, but sulfa drugs cannot be safely used in the first 4 or 5 days following ultraviolet blood irradiation therapy.

Conclusions

1. Ultraviolet Blood Irradiation Therapy is the Safest and Most Efficient Method of controlling most acute pyogenic infections with one notable exception, namely, subacute bacterial endocarditis.

2. Ultraviolet blood irradiation therapy in our opinion is the procedure of choice in the treatment of sulfa-resistant and penicillin-resistant infections of the acute pyogenic infection type.

3. **Ultra violet blood irradiation therapy is the procedure of choice in the treatment of acute infections, and should be tried out universally for such infectious disease processes.**

4. **The preoperative use of Ultraviolet Blood Irradiation Therapy allows the safe removal of foci of infection in such serious disease as incomplete septic abortion with or without an associated septicemia, acute rheumatic fever with or without extensive myocardial damage, acute exacerbations of chronic rheumatoid arthritis and advanced bronchial asthma.**

5. It is our belief that Staphylococcemias can be most effectively controlled by joint use of penicillin and Ultraviolet Blood Irradiation Therapy.

6. **These results are in close agreement with those obtained by other workers in this field."** - Dr George Miley MD; Dr Jens A. Christensen MD, Blood Irradiation Clinic of the Hahnemann Medical College and Hospital of Philadelphia, Pa., in **"Ultraviolet Blood Irradiation Therapy**: Further studies in acute infections", The American Journal of Surgery, April 1947.

1948

"From observations made on the work done on animals a corrected or extended hypothesis was established. **The evidence accumulated so far seemed to indicate that the impingement of small, carefully regulated doses of selected ultraviolet rays directly upon the blood stream of test animals in some way increased the bactericidal properties of the blood stream; that by this method of treatment some influence was exerted upon the vital resistance factors of the host, enabling it to overcome the infection and to progress to complete recovery; that some influence was exerted upon the toxic conditions produced by the disease, either by direct action upon the toxins themselves or by indirect action on the toxins through the host's rallied defense mechanisms.** The literature searched earlier indicated that **certain known toxins had been inactivated directly by ultraviolet rays under given conditions**. The work on animals was carried on until it was definitely determined that the animals suffered no ill effects from the treatment and yet showed a clinical detoxification in vivo. **The first treatment on a human took place in 1928. Consultation held the patient to be in a moribund state from septic abortion complicated by hemolytic streptococcus septicemia.**

Ultraviolet blood irradiation therapy was instituted as a last resort to see if the septicemia in a human could be affected.

The patient responded to treatment and proceeded to an uneventful recovery.

She has since borne 2 children, and when last checked in 1940 was found to be in good health with a normal urinalysis and blood count.

Nothing further was done in the treatment of human patients until 1933.

This first became possible in 1933.

Dr Virgil K. Hancock, MD, Seattle, Washington, with Dr James Tate Mason, MD, felt justified in using the procedure as a last resort on a patient, apparently moribund, with Advanced Hemolytic Streptococcus Septicemia.

This case was described in detail by Hancock and Knott in the first published article reporting this technic. Successful conclusion of the case led to further use in similar cases of serious nature in which it was believed the patient was in a moribund state. In a series of 75 cases in which the diagnoses were confirmed by x-rays, all patients were treated by this method and, according to Hancock, the method Was Found to be Extremely Valuable in combatting the Pneumonia.

The course of the disease following Ultraviolet blood irradiation was marked by a rapid fall in temperature, disappearance of cyanosis, often within 3 to 5 minutes, cessation of delirium if present, a rapid subsidence of toxic symptoms generally, a marked reduction in pulse rate and a rapid resolution of consolidation.

A shortening of hospitalization and convalescence occurred regularly. This procedure was later found by Miley to be Especially Valuable in the Treatment of pneumonia in which Chemotherapy Had Proven of Doubtful Value. Dr George P. Miley, New York, was one of the early workers with the procedure after Knott improved the chamber and released them to physicians for further accumulation of clinical data.

Miley became interested in the Oxygen Exchange Factor, suspected and commented upon by Knott. He was Particularly Impressed by the Rapid Disappearance of Cyanosis Following Treatment. Miley made extensive studies on the combined Oxygen values of venous blood before and after irradiation in pathologic states. This work was published in June 1939, a**nd showed a General Increase in the combined Oxygen value of venous blood Following Irradiation.**

The procedure has been used clinically and reported upon by several workers following Hancock and Knott's article on the treatment of infections with the method. Barrett discusses 5 years experience and reported on irradiation of blood with ultraviolet spectral energy in 2 articles.

Miley published articles on the use of the procedure in the Treatment of:

1. **Thrombophlebitis.**
2. **Staphylococcemias.**
3. **Botulism / Poliomyelitis.**
4. **Non-Healing Wound.**
5. **Acute Pyogenic Infection.**

And Miley and Co-Workers have reported its use in the Treatment of:

1. **Peritonitis.**
2. **Acute Infections.**
3. **Asthma.**

Encephalitis

In addition Barger quoted in detail **3 Cases of Advanced Encephalitis in which he had used Ultraviolet Blood Irradiation, stating that in each case following this type of treatment a rapid disappearance of all signs and symptoms of Encephalitis occurred,** and that no residuals were apparent after from 6 months to 3 years.

Rebbeck has reported its use in the Treatment of:

1. **Escherichia Coli Septicemia.**
2. **Postabortional Sepsis.**
3. **Puerperal Sepsis.**
4. **And its Use Preoperatively.**

Rebbeck and co-workers reported its use in the Treatment of:

1. **Peritonitis.**
2. **Double Septicemia.**

Typhoid Fever

Rebbeck and Lewis have **found in 9 consecutive cases of Typhoid Fever, that in 6 patients who received Ultraviolet Blood Irradiation there was a Remarkably Rapid Recovery** as contrasted with 3 control cases in which 1 death occurred.

Biochemical and Physiologic Effects

The Favourable Clinical Results observed Are Due To Many Biochemical and Physiologic Effects:

Notably an increase in blood Oxygen absorption, a rise in phagocytic action and general immunologic status, the setting up of an efficient detoxifying mechanism, and increased rate and volume of blood flow through the capillary circulation and beneficial alteration chemically of certain important constituents of the blood, e.g., adrenalin, dihydroxy-phenylalanine, cysteine hydrochloride, glutathione and ergosterol.

Ultraviolet Blood Irradiation Therapy
Powerful Therapeutic Agent

Thus, Ultraviolet Blood Irradiation Therapy; Must Be Considered as a Powerful Therapeutic Agent, in a wide variety of disease processes, since in using this method one is applying certain fundamental biochemical and physiologic effects." - E.K. Knott D.Sc., in "Development of ultraviolet blood irradiation", The American Journal of Surgery, August 1948.

1950

"A series of 336 patients is presented of which 110 consecutive unselected patients were treated preoperatively and postoperatively with Ultraviolet Blood Irradiation. A marked reduction in the number and severity of postoperative complications in the patients Treated with Blood Irradiation is shown:

1. **Abdominal Distension is remarkably decreased.**
2. **The need for antibiotic therapy is greatly minimized.**
3. **Complications of Phlebothrombosis and Thrombophlebitis are decreased.**
4. **Mortality is decreased."** - Dr E.W. Rebbeck MD, in "Use of Ultraviolet Blood Irradiation (Knott technic) in biliary tract surgery", The American Journal of Surgery, July 1950.

1989

“Photochemical Effects Upon the Cornea, Skin and Other Tissues.

Summing Up: it is possible to conclude that irradiation with monochromatic visible light in the Blue, Red, and Far Red regions can enhance metabolic processes in the cell and can activate proliferation. The data indicate that irradiation causes a rearrangement of the cell metabolism, light being only in the role of a trigger. This is the reason the doses needed for causing bio-stimulation effects are comparatively low (10- lo3 J/m2) and the irradiation times needed are short (10-100 s).

Conclusions:

1. Laser bio-stimulation is a photo-biological phenomenon. Coherent light is not needed.
2. Primary photo-acceptors are components of the respiratory chain. This explains the universality of low-power laser effects.
3. The respiratory chain components can be the photo-acceptors in the case of cellular metabolism stimulation, as well as inhibition depending on the dose of light. At low doses, irradiation causes redox regulation of cellular metabolism; at high doses photodynamic damage prevails.
4. Light quantum is only a trigger for cellular metabolism regulation. This explains the low doses and intensities needed.
5. The magnitude of the bio-stimulation effect depends on the physiological state of the cell before irradiation. This explains why the bio-stimulation effect is not always possible.
6. The therapeutic effects of low-power laser irradiation can be explained by an increase of proliferation of G0 and G1 cells or by changes in the physiological activity of excitable cells.

The positive effects of Phototherapy in the case of “systemic” treatment (e.g., pain relief) can be explained by the fact that low-intensity light (Blue, Red) acts on excitable cells (myocardial cells, neurons) to generate action potentials in them, and to alter their beating frequency, etc. (Arvanitaki and Chalazonitis 1947; Salet et al. 1979; Uzdenskii 1982).

Proof can be found in these works; that **Photoreception occurs on the level of mitochondria and that the intensification of respiratory metabolism of the excitable cell affects the electrophysiological properties of the cell membrane.**

It is quite possible that **the universality of low-power laser effects is due to the universal photobiological mechanism-variation of the redox state of the respiratory chain components leading to the changes in the physiological state of the cell (i.e, the increase of the proliferation activity of non-excitable cells or changes in activity potentials of excitable cells).**

It is proposed that **enhanced wound healing due to irradiation with low-intensity visible laser light (He-Cd, He-Ne and semiconductor lasers) is due to the increasing proliferation of cells."** - in "Photobiology of Low-power Laser Effects", Health Physics, May 1989.

1990

In 1990 the FDA approved the use of a Photopheresis machine for study, developed by Dr. Eldeson and a company called THERAKOS. They were granted preliminary certification to perform clinical trials studies with HIV and Graft Host Diseases. Studies which were performed by Columbia University's Photopheresis Unit in Morristown, NY, demonstrated that 4 of 7 patients (57%) with so-called "HIV/AIDS" became NEGATIVE after 5 to 19 treatments and remained so for 14 to 16 months after termination of the study. (Taken from the Annals of New York Academy of Sciences.)

1993

"In 1993, Quantum Devices (Barneveld, WI) developed a Light-Emitting Diode (LED) for NASA to use in their plant growth experiments. The experiments demonstrated that **Red LED wavelengths could Boost Plant Growth,** but coincidentally the scientist's **skin lesions began to heal faster** as well.

NASA subsequently began to study the use of **LED to increase the metabolism of human cells and stem the loss of bone and muscle** in astronauts.

Low-Level Laser Therapy has been actively used for nearly 40 years, during which time it has been known to: Reduce Pain, Inflammation, and Edema.

It also has the ability to **promote healing of wounds, including deep tissues and nerves, and prevent tissue damage through cell death.**

Clinical Applications

The 4 common targets for Low-Level Laser Therapy are:

1. **Lymph Nodes to reduce edema and inflammation.**
2. **Site of Injury to promote healing and reduce inflammation.**
3. **Nerves to induce analgesia.**
4. **Trigger points to reduce muscle spasms.**

The physician determines the correct synchronizations of continuous or pulsed laser emission. **Penetration depth is determined by wavelength and power.**

The U.S. Navy research determined **810 nm to be optimal for penetration.**

Treatment times are in the range of 30 s to 1 min, but there are many areas treated for comprehensible protocol, which often takes approximately 30 min to perform.

For stimulating repair and decreasing inflammation, 2.5 Hz pulse is recommended, while a continuous beam is ideal for analgesia and tender points." - in "A NASA Discovery has current applications in Orthopaedics", Current Orthopaedic Practice, January 2015.

1995

"NASA takes their first **Red Light Therapy devices to space to support tissue repair in astronauts, laying the foundation for light therapy applications in skin."** - in "Professional Beauty magazine", Australia, Iss.1, 2025.

2004

In 2004 the FDA approved a clinical trial for the non-pharmacological treatment of Hepatitis C under the Investigational Device Exemption. Non-responders to Interferon / Ribaviran were tested. As an example of the effectiveness of Ultra Violet Light Therapy in the trial of 13 individuals, it is reported that 3 subjects had sustained **"viral" load reductions of 90%, or greater, at 10 weeks post treatment, and 8 had sustained reductions of 50%, or greater**, 2 subjects did not respond to the therapy. There were **no reported adverse events related to the therapy.**

2005

> ***"Tiny Light-Emitting Diode (LED) chips used to Grow Plants in space, are lighting the way for Cancer Treatment, Wound Healing, and Chronic Pain Alleviation."*** *- in **"Lighting the Way for Quicker, Safer Healing"**, NASA, 2005.*

In 2005, So-Called "HIV/AIDS" clinical trials were held in the Dominican Republic by one of our research doctors proving **Ultra Violet Light Therapy was safe and effective in the Treatment of So-Called "HIV/AIDS", 36 patients were treated with the Ultra Violet Light Therapy, With Outstanding Results.**

2007

A recently developed non-invasive, sub-lingual HMR Ultra Violet Delivery Device breaks into the world of Alternative Medicine. No one could have projected its efficacy and economical use. For the last couple of years it has been tested rather extensively in Africa and the results are impressive. Its effectiveness and ease of application astounds most medical professionals familiar with the Ultra Violet Light Treatment. Almost 200 patients in Africa are reporting undetectable So-Called "viral" load levels. After research we have come to believe that this is the first time in the history of the "HIV/AIDS" from a So-Called "virus", that a combination of a negative Elisa Test, and an undetectable "viral" load test, was achieved after having been diagnosed with "HIV."

It is indicated that a few other accomplishments for this device has been: An efficacy for treatment of certain types of Cancers; The HMR delivery device has been shown to disarm Malaria; The HMR developers designed oxygenated water to compliment the HMR device; A newly designed HMR device has been manufactured in Japan; A partnership has recently been developed with Catholic Hospitals in Ghana; **The device reduced a Gangrene infection** in 88-year-old Israeli man.

Successful use of Ultraviolet Light Therapies has a history of more than 100 years. Through the 1940's and 1950's, it is estimated that dozens of physicians performed more than 300,000 clinical tests and besides their great curative success the most notable fact they mention is that not 1 person died from this treatment modality. Hundreds of clinical practitioners worldwide currently utilize this effective treatment modality for many blood borne diseases. Throughout the decades, data was developed worldwide proving the efficacy of Ultraviolet Light Treatments. Within today's FDA protocols, the information is considered "anecdotal".

It is time to incorporate Ultra-Violet Light Therapy, Oxidative Medicine and other proven Therapies into the clinical treatment protocols of today.

Ultra Violet Light Therapy Overview

It is well known Ultraviolet Light will: Purify and Deodorise Air, Sterilise Water, and Destroy Bacteria. Contaminated objects such as surgical instruments, bedding, room air and human skin is also cleansed rapidly of bacteria with the use of Ultraviolet light.

What is not well known, is the fact that:

Overwhelming Data, has been Accumulated Proving The Efficacy of Light in Various;

1. **Frequencies.**
2. **Intensities.**
3. **Modalities.**

Has the ability to Destroy Pathogens in the Blood; specifically Bacterial and Fungal.

This is Also Accomplished by Utilizing the Body's Own Natural Defences, to recognize and annihilate the sick, diseased cells.

Research into the use and **Efficacy of Ultraviolet Light for Treatment of Disease; was initiated in the 1870's, and continued until the late 1940's.**

One of the first researchers to experiment with Ultraviolet Light was Niels Ryberg Finsen (Nobel Peace Prize for Physiology of Medicine in 1903, for his Ultraviolet Treatments of 300 people with Lupus).

Another pioneer to experiment with Light Therapy was Kurt Naswitis, who directly irradiated the blood with Ultraviolet Light through a shunt in 1922.

Then beginning in the 1920's and continuing through the 1930's, Seattle scientist Emmet Knott, D.Sc., sought to harness, in an extracorporeal way, the known **Bactericidal Property of Ultraviolet Rays, in order to treat infectious diseases of the blood.** Knott built an apparatus that would remove blood from the body through a tube, citrate it to avoid coagulation, expose it in a small chamber to calibrated Ultraviolet Irradiation, and then pump it through a tube back into the body. **Dr Rebbeck, Dr Olney, and Dr Miley experimented successfully with light (Blood Irradiation / Ultraviolet Blood Irradiation Therapy / Ultraviolet Irradiation) in the 1940's. Ultraviolet Blood Irradiation Therapy came to be used to treat Bacterial, and Autoimmune Diseases.**

However, enthusiasm over the new Antibiotics and Vaccines in the 1950's, caused the Ultra Violet Blood Irradiation device to be placed on the shelf even though for certain indications:

1. **Hepatitis.**
2. **Pneumonia.**
3. **Streptococcal Toxemia.**

Ultraviolet Blood Irradiation Treatment was demonstrably superior.

In the 1970's interest in Ultraviolet Blood Irradiation Therapy revived in Russia. About the same time Dr Edelson, Yale University, developed a new form of Blood Irradiation termed "Photopheresis", which entailed triggering chemotherapy with a small dose of Ultraviolet Blood Irradiation Therapy.

By the 1990's, Russian physicians were using low-intensity lasers beamed down a wave-guide directly into the blood (Laser Blood Irradiation) to achieve roughly equivalent effects.

Regrettably, **Antibiotics, Vaccines, and Corticosteroids in the 1950's, put a halt to the growing interest in Ultraviolet Blood Irradiation Therapy. The Medical Trade was awash in enthusiasm over the new wonder drugs.** And only a handful of physicians continued to used Ultraviolet Blood Irradiation Therapy.

Even though it was illogical to set aside a Therapy that could treat the diseases of Chronic Hepatitis, and Pneumonia, that were impervious to antibiotics; which in fact happened.

Research into this Effective Therapy came to a virtual halt.

From 1955 to 1990's, only a few American physicians continued to work with a Ultraviolet Blood Irradiation Therapy.

The technique was never again taught in medical schools and training centers.

It is also hard to justify the way that American medical science has overlooked the many reports of clinical trials of Ultraviolet Blood Irradiation Therapy and Laser Irradiation Therapy, in Russian, and East German medical journals, and books over the past 2 decades, especially given the intense effort to identify promising approaches to the treatment of HIV and related conditions.

The infusion machine did, receive FDA "grandfather" status as a device that was sold and distributed in interstate commerce prior to 1976 (510 k) status.

The development of multi-drug resistance to antibiotics in recent years and the search for less toxic therapies have led to a renewed interest in Ultraviolet Blood Irradiation Therapy. **Millions of patients have been successfully treated with Ultraviolet Blood Irradiation Therapy, and scores of clinical trials have been conducted in Russia, Ukraine, and East Germany.**

Light Therapy is also used by other independent minded physicians around the world. **The Foundation For Light Therapy, as well as many public sector companies has accumulated irrefutable evidence that infectious blood borne diseases can be cured with the use of light and/or photoactive substances such as Light Activated Substance (LAS-1).**

Light Activated Substance "LAS-1"

"Scientists have now determined that the future for effective treatment with the least side effects is utilizing the body's own natural defences.

With this in mind The Foundation now presents some information regarding "Light Activated Substance No. 1" (LAS-1). Unlike vaccines and immunization, LAS-1 is used to stimulate the body's natural immune system. LAS-1 is the most exciting, promising, effective treatment that the Foundation For Light Therapy is aware of. It is essentially free of side effects, and initial results have been extremely promising. **The body is designed with a defence system against disease through which white blood "soldier" cells engulf "invading" foreign organisms. Under normal circumstances they self-destruct, taking the invader with them through a process of super oxidation (hydrogen peroxide).**

Infectious diseases carry toxins that prevent the natural production of hydrogen peroxide in the white "soldier" cell. The invading organism is then harboured within the white cell and although the cell continues to engulf the "invader", it does not have the ability to destroy it. LAS-1 works like an engine that forces the production of hydrogen peroxide within the white blood cell, resulting in the destruction of both the disease organism and the harbouring white cell. LAS-1 utilizes the body's own natural defences to recognize and annihilate the sick, diseased cells. Normal cells have an enzyme that inhibits oxidation and are therefore not affected by the drug.

In technical terms, LAS-1 (human), and LAS-2 (veterinary) are similar formulae, separated for regulatory reasons into two drugs.

Nevertheless, they both accomplish the same chemistry.

The chemical principal is the selective induction of high levels of Reactive Oxygen Species (ROS) (superoxides/peroxides/singlet oxygen) in infected macrophages (white cells that ingest foreign matter and invaders) and dysplastic cells (rapidly proliferating tumorous macrophage cells that couldn't handle the invaders). Normally these macrophages (big eaters) produce, through an enzyme system, high levels of ROS to destroy what has been engulfed.

These macrophage enzyme systems can be blocked from producing the Reactive Oxygen Species that kill the invaders by microbial toxins from the ingested organism. That's how disease takes hold and proliferates.

LAS-1 works best against intracellular infections which involve white cells in the blood and major organ systems that engulf and destroy invaders with peroxide under normal circumstances. The most compelling applications will be against protozoal (Malaria, Equine Meningitis & Babesia), Mycobacterial (Tuberculosis & Leprosy) and spore forming bacteria with civil defense implications (anthrax & plague). Babesia and equine meningitis are the best rollouts for veterinary markets. Malaria logically follows in humans as the primary rollout. The spore forming bacteria should be discussed with discretion at high governmental levels, with control of the technology not in the USA.

LAS-1 chemicals are highly concentrated (1000x greater than in normal cells) into intracellular infected cells and those that have become dysplastic from long term ROS incompetence. LAS-1 chemicals bypass the toxin blockade to forcibly stimulate the ROS. Fortunately, normal cells have mechanisms to prevent excessive concentration of LAS-1 and they modulate the excessive production of ROS. Otherwise, normal cells would explode. The ROS produced by LAS-1 induction cause the susceptible invaders to explode and the incompetent cell harbouring them to commit suicide (apoptosis). The invader and its safe haven both foam and explode. Normal cells or those loaded with antioxidants manifest nothing except a rise in metabolism." - in "The Foundation for Light Therapy", 23 February 2001.

Recent experiments have been proven to show that both Photo Therapy, and LAS-1 technologies, used intermittently, enhances the overall treatment process.

The therapeutic process of Light Therapy also referred to as "Photo Therapy" or "Photoluminescence", has far reaching clinical implications in the treatment and/or prevention of infectious diseases.

The word "Photoluminescence" sounds hi-tech, but it is an extremely simple and safe method of treating a patient.

"Photo" refers to light, and "luminescence" refers to the emission of light.

Over the last few decades it has been scientifically determined that Ultra-Violet Light, in a specific nanometer range has been most effective in destroying blood borne pathogens.

Recent technological innovations in electronic hardware, along with advances in bulbs and lasers, coupled with developments in photoactive substances have brought this technology to a breakthrough level.

In layman's terms, Photoluminescence causes a chemical reaction in which the shell walls are pierced killing the bacteria, and then by "marking" (identifying) them. The blood and the "debris" ("marked" dead bacteria), are then returned into the body "exciting" or stimulating the immune system.

The body's now "excited", natural "soldiers", or "killer" cells seek out and destroy the marked, identified diseased "invaders."

Fundamental Laws Governing the Mechanism of Photochemical Reaction:

1. Grotthus-Draper Law; Also known as the first law of photochemistry, states that:

> *"Only Light that is Absorbed Can Act Chemically."*

2. Bunsen-Roscoe Law:

> *"A photochemical change is proportional to the intensity and duration of illumination (exposure to light)."*

3. Stokes Law:

> *"The wavelengths of secondarily emitted rays are greater than the wavelengths of the primary exciting rays."*

4. Johannes Stark Law of Photochemical Equivalence:

> *"Each absorbed quantum should cause one light absorbing molecule to react photochemically."*

5. Walther Herman Nernst:

"Chain reactions are produced by continued secondary emanations"; is a scientific principle related to photochemistry and chemical kinetics.

This concept, posits that once a primary reaction is initiated, often by light absorption, the products of that initial reaction "secondary emanations", can continue to propagate further reactions, leading to a chain reaction.

Thus we readily see that the Mechanism Underlying the complex Photochemical Procedure of Photoluminescence, or Photo-Therapy must conform to certain known laws. The photochemical reaction itself is a desired effect, and can be utilized practically and predictably to obtain favourable clinical results.

Biochemists utilizing the laws of physics explain the following:

> ***"All Energy, and all Living Things Emit Light.***
> ***The body's blood cells emit light, but a weak or diseased cell, will emit more light than normal cells, thus rendering them more attracted and susceptible to light."***

Ultraviolet Light may be used as a source of Varying Energy.

Generally we may assume that in excessive amounts, Ultraviolet may be harmful to living beings; in optimum amounts it is of great practical value; and in inadequate amounts, it may have little or no effect.

In Photoluminescence Therapy, a small amount of blood, from 60cc's to 250cc's is drawn from the body, passed through a chamber, "treated" with Ultraviolet Light and returned to the body. In order to more fully understand how this mechanism works, a basic distinction between a bacterial cell, and a healthy cell, and how this pertains to Photoluminescence must be established.

Two photosensitive amino acids: Phenylalanine, and Tyrosine, are present in all cells in varying degrees. Bacterial cells contain at least 5 times as much of these amino acids as healthy red and white blood cells. Thus, bacterial cells have a much higher degree of photoactive sensitivity. **In addition, diseased cells are characteristically smaller in size,** with thinner shells. Through the process of photoluminescence the smaller bacterial cells are targeted and absorb 5 times as much photonic energy as their healthy counterparts.

The healthy cells remain intact while the diseased cells are killed and marked.

There is reason to believe that by destroying the bacteria in the treated sample of blood, an "autogenous (self-generated) vaccine" is produced.

When this vaccine is coupled with the photonic energy given off by the treated blood, "induced secondary energy" is produced and the bacteria in the patient's bloodstream are rapidly destroyed.

A "flushing" of the face normally occurs immediately after treatment.

This indicates an additional amount of Oxygen has been introduced into the blood stream. A slight rise in temperature may also occur, which is the body's natural reaction when the immune system is stimulated. The stimulated immune system continues its activity for hours and sometimes days after the treatment has been induced. The amount of treatments needed are determined by variables such as the state of health of the patient's immune system, length of time the patient has been ill, and the severity of the affliction(s).

Again, Photo or Light-Therapy is effective unto itself, as is Light Activated Substance (LAS-1). These technologies, used intermittently have produced even more favourable results and with no known side effects. Preventative therapy for healthy individuals can be taken once every 2 to 3 months.

Understanding Ultra-Violet Light Therapy

During his lifetime, Dr Popp, forged new ground in scientific communities when he demonstrated that the Body Cells emit a radiation of Light in the form of Biophotons. This Biophoton Cloud, also called Ultra-weak Photon Emission (UPE) is spontaneously emitted from the skin of humans. Dr Popp, **found this Spectrum of Colourful Electromagnetic Light Energies (Biophotons), form an intricate, highly organised System of Communication Between the Body Cells, and ultimately, it Contributes to the Regulation of All Body Physiological Processes.**

In other words, the Human Body Is Essentially a "Being of Light."

Man Is Essentially A Being of Light

"We know today that Man: Essentially Is A Being of Light. And the Science of Photobiology, proves this. In Terms of Healing, the Implications Are Immense. We now know, that quanta of light; can initiate, or arrest, cascade-like reactions in the cells, and that genetic cellular damage can be virtually repaired, within hours, by faint beams of light.

Understanding the Complex Relationship Between Light and Life

We are still on the threshold of fully Understanding the Complex Relationship Between Light and Life, but we can now say emphatically, that:

The Function of Our Entire Metabolism in Dependent on Light." - Fritz-Albert Popp

Fritz-Albert Popp, thought he had discovered a cure for cancer. It was 1970, and Dr Popp, a Researcher in Biophysics, particularly in the study of Biophotons, at the University of Marburg in Germany, had been teaching radiology; the interaction of ElectroMagnetic (EM) Radiation on Biological Systems. He'd been examining 2 almost identical molecules: benzo[a]pyrene, a polycyclic hydrocarbon known to be one of the most lethal carcinogens to humans, and its twin (save for a tiny alteration in its molecular makeup), benzo[e]pyrene. He had illuminated both molecules with Ultraviolet (UV) Light in an attempt to find exactly what made these 2 almost identical molecules so different.

Why Ultra-Violet Light?

Dr Popp chose to work specifically with Ultra-Violet Light because of the experiments of the Russian Biologist Alexander Gurwitsch, who, while working with onions in 1923, discovered that **roots could stimulate a neighbouring plant's roots if the 2 adjacent plants were in Quartz Glass pots, but not if they were in Silicon Glass pots.** The only difference being that the **Silicon filtered Ultra-Violet wavelengths of light while the Quartz did not.** Gurwitsch theorized that **onion roots could communicate with each other by Ultraviolet Light.**

> *"Some concluding Turlygin's remarks: 'From the viewpoint of physics, the most significant fact is that the behavior of a test person; the duration of the exposition; gives a clear optical picture, which can be explained only by the presence of radiant energy.* ***These experiments do not leave us in doubt about presence of radiation emanating from the human body."*** *According to Turlygin, he came to the conclusion that some of the properties and parameters of recorded radiation differ from electromagnetic radiation, for example, it does not deviate in the electric field of a capacitor." - in "Parapsihologija. Jenciklopedija zagadochnogo i nevedomogo", 2005.*

Image: All vibrations of energy are part of the electro-magnetic spectrum. These include electrical energy, heat, sound, light, radio waves and radioactive waves. Ultra-Violet light is merely a small portion of the spectrum of EM energy with a very short wavelength.

What Dr Popp discovered was that benzo[a]pyrene (the cancer producing molecule) absorbed the Ultra-Violet Light, then re-emitted it at a completely different frequency - it was a light "scrambler." The benzo[e]pyrene (harmless to humans), allowed the Ultra-Violet Light to pass through it unaltered.

Dr Popp was puzzled by this difference, and continued to experiment with UV light and other compounds. He performed his test on 37 different chemicals, some cancer-causing, some not. After a while, he was able to predict which substances could cause cancer. **In every instance, the compounds that were carcinogenic took the Ultra-Violet Light, absorbed it and changed or scrambled the frequency.** There was another odd property of these compounds: each of the carcinogens reacted only to light at a specific frequency - 380 nm (nanometres) in the Ultra-Violet range.

Dr Popp kept wondering **why a cancer-causing substance would be a light scrambler.** He began reading the scientific literature specifically about human biological reactions, and came across information about a phenomenon called **"Photorepair."**

Photorepair

It is well known, from biological laboratory experiments, that if you blast a cell with Ultra-Violet Light, so that 99% of the cell, including its DNA, is destroyed, you can almost entirely repair the damage in a single day just by illuminating the cell with the same wavelength at a much weaker intensity.

To this day, scientists don't understand this phenomenon, **Photorepair, but no one disputes it. Dr Popp, also knew that patients with Xeroderma Pigmentosum (skin condition), eventually die of skin cancer because their photorepair system can't repair solar damage.**

He was also struck by the fact that photorepair works most efficiently at 380 nm - the same frequency that the cancer-causing compounds react to and scramble.

This was where Dr Popp made his logical leap. **If the carcinogens only react to this frequency, it must somehow be linked to photorepair.** If so, this would mean that **there must be some kind of light in the body responsible for photorepair.**

A compound must cause cancer because it permanently blocks this light and scrambles it, so photorepair can't work any more.

Light is an Electromagnetic Wave, with in-phase oscillating electric and magnetic fields perpendicular to the direction of light's propagation.

The shorter the wavelength, the more energetic the photon, but the more susceptible it is to changes in the speed of light through a medium. This was known in the aftermath of Maxwell's equations: by the mid-to-late 1800's.

Light Inside the Body

Dr Popp wrote on the subject:

"Photon storage in biological systems", Electromagnetic bio-information, 1979.

"Biophoton Emission", Cell biophysics, 1984.

"Electromagnetic bio-information", 1989.

"Recent advances in biophoton research and its applications", World scientific, 1992.

"Biophoton emission of the human body", Journal of Photochemistry and Photobiology B: Biology, 1997.

Dr Popp was approached by a student Bernhard Ruth, who asked Dr Popp to supervise his work for his doctoral dissertation.

Dr Popp told Ruth he was prepared to do so, if the student could **show that light was emanating from the human body.**

Ruth happened to be an excellent experimental physicist.

Within 2 years, Ruth had constructed a machine resembling a big X-Ray detector which used a photomultiplier to count light, photon by photon.

The machine had to be highly sensitive because it had to measure extremely weak emissions. In an old documentary film taken in the laboratory at the International Institute of Biophysics, Dr Popp opens a chamber about the size of a bread box. He places a fresh cutting from a plant and a wooden match in a plastic container inside the dark chamber and closed the light proof door. Immediately he switches on the photomultiplyer and the image shows up on a computer screen.

The match stick is black, while the green, glowing silhouette of the leaves is clearly visible.

"We now know, that man is essentially a being of light." *- Dr Fritz-Albert Popp, MD*

In 1976, they were ready for their first test with cucumber seedlings.

The photomultiplier showed that photons, or light waves, of a surprisingly high intensity were being emitted from the seedlings. In case the light had to do with an effect of photosynthesis, they decided that their next test, with potatoes, would be to grow the seedling plants in the dark. This time, when the seedlings were placed in the photomultiplier, they registered an even higher intensity of light.

What's more, the photons in the living systems they'd examined were more coherent than anything they'd ever seen. Dr Popp began thinking about light in nature. **Light was present in plants and was used during photosynthesis. When we eat plant foods, he thought, it must be that we take up the photons, and store them. When we consume cabbage, for example, and digest it, it is metabolised into carbon dioxide (CO2) and water, plus the light stored from the sun and photosynthesis.** We extract the CO2 and eliminate the water, but the **light, an Electric Magnetic Wave**, must be stored. When taken in by the body, the energy of these photons dissipates and becomes distributed over the entire spectrum of EM frequencies, from the lowest to the highest.

This Energy is the Driving Force for All the Molecules in our Body. Before any chemical reaction can occur, at least one electron must be activated by a photon with a certain wavelength and enough energy. The biochemist and Nobel Prize winner Lehninger mentions in his textbook that some reactions in the living cell happen quite a lot faster than what corresponds to 37C temperature.

The explanation seems to be that the body purposely directs chemical reactions by means of electromagnetic vibrations (biophotons).

Photons (Light) Control Everything in the Cell

Photons switch on the body's processes like an orchestra conductor bringing each individual instrument into the collective sound.

At Different Frequencies, they Perform Different Functions. Dr Popp found that molecules in the cells responded to certain frequencies, and that a range of vibrations from the photons caused a variety of frequencies in other molecules of the body. This was supported by Dr Veljko Veljkovic, head of the Center for Multidisciplinary Research and Engineering, Institute of Nuclear Sciences Vinca, Serbia. She dared to ask the question that has forever puzzled cellular biologists: What is it that enabled the tens of thousands of different kinds of molecules in the organism to recognize their specific targets? Living processes depend on selective interactions between particular molecules, and that is true for basic metabolism to the subtlest nuances of emotion. It's like trying to find a friend in a very big very crowded ballroom in the dark. The conventional picture of a cell even now is that of a bag of molecules dissolved in water. And through bumping into one another by chance - random collisions - those molecules that have complementary shapes lock onto to each other so the appropriate biochemical reactions can take place.

This "lock and key" model has been refined to a more flexible (and realistic) "induced fit" hypothesis that allows each molecule to change shape slightly to fit the other better after they get in touch, but the main idea remains the same. It is supposed to explain how enzymes can recognize their respective substrates, how antibodies in the immune system can grab onto specific foreign invaders and disarm them. By extension, that's how proteins can "dock" with different partner proteins, or latch onto specific nucleic acids to control gene expression, or assemble into ribosomes for translating proteins, or other multi-molecular complexes that modify the genetic messages in various ways. But with thousands of reactions happening each second in just one cell this seems pushing the "mechanical" concept a bit too far. What has been proposed is that somehow each molecule sends out a unique electromagnetic field that can "sense" the field of the complimentary molecule. It's as if there is a "dance" in the cellular medium and the molecules move to the rhythm. The music is supplied by the biophoton.

Proteins and Nucleic Acids Singing to One Another?

"Veljkovic and Cosic proposed that molecular interactions are electrical in nature, and they take place over distances that are large compared with the size of molecules. Cosic later introduced the idea of **dynamic electromagnetic field interactions, that molecules recognize their particular targets and vice versa by electromagnetic resonance.** In other words, **the molecules send out specific frequencies of electromagnetic waves which not only enable them to "see" and "hear" each other**, as both photon and phonon modes exist for electromagnetic waves, but also **to influence each other at a distance and become ineluctably drawn to each other if vibrating out of phase (in a complementary way).**" - in "The Real Bioinformatics Revolution: **Proteins and Nucleic Acids Singing to One Another?"**, Science in Society, 2 February 2007.

> ***"There are about 100,000 chemical reactions happening in every cell each second. The chemical reaction can only happen if the molecule which is reacting is excited by a photon... Once the photon has excited a reaction it returns to the field and is available for more reactions... We are swimming in an ocean of light."*** *- in "Tensegrity No.12: The Quantum Cell Membrane", 14 December 2014.*

These "biophoton emission", provided an ideal communication system for the transfer of information to many cells across the organism. But the single most important question remained: **Where was the Light coming from?**

Cells "Talk" to Each-Other

When you get a cut or scratch on your skin, the cells that are injured; signal the surrounding healthy cells to begin reproducing copies of themselves to fill in and mend the opening. When the skin is back to normal, a signal is sent to the cells to tell them to stop reproducing. Scientists have wondered exactly how this works.

With biophoton emissions, this phenomenon of coordination and communication can only occur in a **Holistic System, with one central orchestrator. Dr Popp showed in his experiments that these weak light emissions were sufficient to orchestrate the body's repairs.**

The emissions had to be low intensity because these communications took place on a very small, intracellular, quantum level. Higher intensities would have an effect only in the world of the large and would create too much "noise" to be effective. **The number of photons emitted seemed to be linked to the organism's position on the evolutionary scale, the more complex the organism, the fewer photons were emitted.**

Rudimentary Animals and Plants tended to emit 100 photons/cm2/sec at a wavelength of 200-800 nm, corresponding to a very-high-frequency EM wave well within the visible range, whereas **Humans emit only 10 photons/cm2/sec at the same frequency.**

In one series of studies, Dr Popp had one of his assistants sit in the room every day for 9 months while he took photon readings of a small area of her hand and forehead.

Dr Popp analysed the data and discovered, that the **Light Emissions followed certain set patterns; Biological Rhythms at 7, 14, 32, 80 and 270 days, and similarities were also noted by Day or Night, by week and by month, as though the body were following the world's biorhythms as well as its own.**

Cancer Is a Loss of Coherent Light

Dr Popp tried out his machine on a series of Cancer patients.

In every instance, these patients had lost Those Natural Periodic Rhythms as well as their coherence. The lines of internal communication were scrambled.

They had lost their connection with the world. In effect, their light was going out. Just the opposite is seen with Multiple Sclerosis.

Dr Popp also examined the effects of stress.

In a stressed state, the rate of biophoton emissions goes up; a defence mechanism designed to restore the patient's equilibrium.

Dr Popp recognised that what he'd been experimenting with was even more than a cure for Cancer or Gestaltbildung.

(Gestalt Formation refers to how the human mind naturally perceives unified, whole patterns or configurations rather than individual, isolated parts).

Here was a model which provided a better explanation than the current neo-Darwinist theory for how all living things evolve on the planet.

"Good Vibes" Means: Coherent Light

Dr Popp came to realise that:

Light in the Body might even Hold The Key to Health and Illness.

In one experiment, he compared the light from free-range hens eggs with that from penned-in, caged hens.

The photons in the former were far more coherent than those in the latter.

Dr Popp went on to use biophoton emissions as a tool for measuring the quality of food.

The Healthiest Food had the Lowest and most Coherent Intensity of Light.

Any disturbance in the system increased the production of photons.

Health was a State of Perfect Subatomic Communication.

Ill Health was a State of Communication Breakdown.

We are ill when our waves are out of synch.

Biophoton emission detection is currently used commercially in the food industry. Agricultural science is looking at Bio-photon emissions to determine plant health for the purposes of food quality control.

[Biophotons (from Bio "life" and Photons "light"): Are Photons of Light in the Ultraviolet, and Visible Light range that are produced by a biological system. They are non-thermal in origin, and the emission of biophotons is technically a type of bioluminescence.

Biophoton Emission (Ultraweak Photon Emission): Is the spontaneous release of extremely faint light from living organisms.]

The Far Reaching Effects of Dr Popp Discovery

In the 1970's Dr Veljko Veljkovic, who now heads the Center for Multidisciplinary Research and Engineering, Institute of Nuclear Sciences Vinca, Serbia, also discovered **a method for predicting which of the hundreds of new chemicals made by the rapidly expanding chemical industry were Carcinogenic, by calculating certain electronic, biophotonic properties of the molecules.**

This method was soon found equally applicable to predicting organic chemicals that were Mutagenic, or Toxic, and even those that were Antibiotic, or Cytostatic (Anticancer).

Biophoton Therapy

Biophoton Therapy is the Application of Light to particular areas of the skin for Healing Purposes. The light, or photons, that are emitted by these units are absorbed by the skin's photoreceptors and then travel through the body's nervous system to the brain, where they help regulate what is referred to as our human bio-energy. By stimulating certain areas of the body with specific quantities of light, biophoton therapy can help reduce pain as well as aid in various healing processes throughout the body.

The theory behind Biophoton Therapy is based on the work of Dr Franz Morell and has been expanded by the work of Dr L.C. Vincent, and Dr **Fritz-Albert Popp** researcher in Biophysics, particularly in the study of Biophotons; made the first extensive physical analysis of biophotons; which were discovered in 1922), **theorized that light can affect the electromagnetic oscillation, or waves of the body and regulate enzyme activity.**

Scientists around the globe began **to consider that the body's communication system might be a complex network of resonance and frequency.**

Dr Popp and his colleagues went on to study the light emissions from several organisms of the same species, first in an experiment with a type of water flea of the genus Daphnia. Tests with a photomultiplier **showed that the water fleas were sucking up the light emitted from each other. Dr Popp tried the same experiment on small fish, and got the same result. According to his photomultiplier, sunflowers were like biological vacuum cleaners, moving in the direction of the most solar photons to hoover them up. Even bacteria swallowed photons from the media they were put in.**

Communication Between Organisms

These emissions have a purpose outside of the body. Wave resonance isn’t only being used to communicate inside the body, but between living things as well. Two healthy beings engaged in “photon sucking”, by exchanging photons.

Dr Popp realised that **this exchange might unlock the secret of some of the animal kingdom's most persistent conundrums: how schools of fish or flocks of birds create perfect and instantaneous coordination.**

Many experiments on the homing ability of animals demonstrate that it has nothing to do with following habitual trails, scents or even the EM fields of the earth, but rather some form of silent communication that acts like an invisible rubber band, even when the animals are separated by miles of distance.

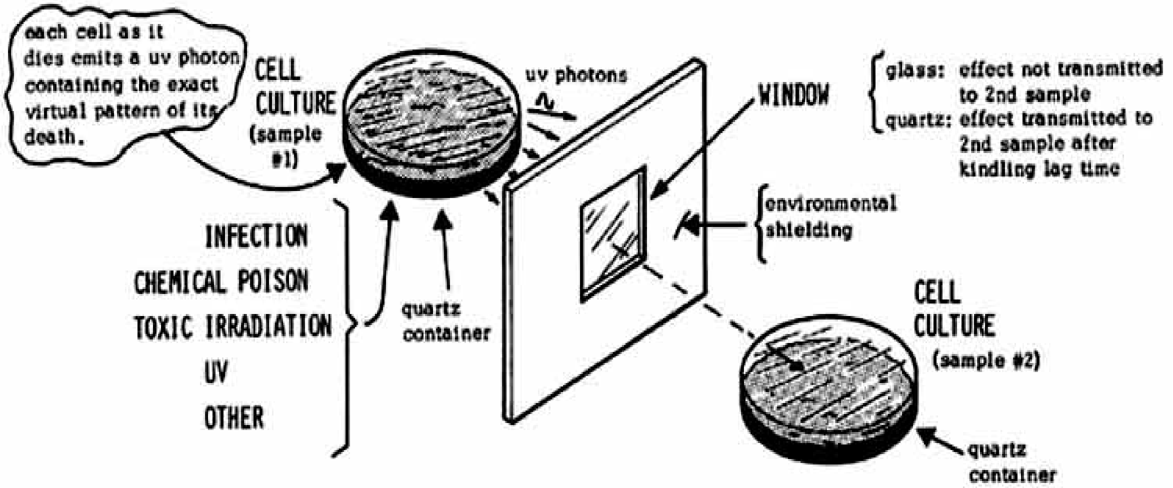
For humans, there was another possibility.

If we could take in the photons of other living things, we might also be able to use the information from them to correct our own light if it went awry.

Death Transmission via the Paranormal "Light" Channel

Some extremely interesting experiments were performed by V. P. Kaznacheev regarding **the paranormal transmission of death by light inter-organism communication.**

Kaznacheev, was a prominent Russian academician, hypothesized that cells transmit "death signals" and biochemical states to adjacent cells via ultraweak electromagnetic emissions (biophotons)**. His research into this phenomenon, termed the "mirror cytopathic effect", explored the non-contact transfer of viral pathology and cellular decay through optical boundaries like quartz glass**



each cell as it dies emits a uv photon containing the exact virtual pattern of its death.

"Two groups of cells were selected from the same cell culture and one sample placed on each side of a window joining two environmentally shielded rooms. The cell cultures were in quartz containers. One cell culture was used as the initiation sample and was subjected to a deadly mechanism; germ, chemical poison, irradiation, ultraviolet rays, etc. The second cell culture was observed, to ascertain any transmitted effects from the culture sample being killed. ***When the window was made of ordinary glass, the second sample remained alive and healthy. When the window was made of quartz, the second sample sickened and died with the same symptoms as the primary sample.*** *The experiments were done in darkness, and over 5,000 were reported by Kaznacheyev and his colleagues. The onset of induced complementary sickness and death in the second culture followed a reasonable time, say 2 to 4 hours, behind sickness and death in the primary culture.* ***The major transmission difference between window Glass and Quartz, is that Quartz transmits both Ultraviolet and Infrared well, while Glass is relatively opaque to Ultraviolet and Infrared.*** *Both quartz and glass transmit visible light. Thus glass is a suppressor of the paranormal channel, while quartz is not. In 1950, Western researchers found that* ***cells could be killed in darkness with ultraviolet radiation, kept shielded from visible light for 24 hours or longer, and then if radiated with visible light the cells would start reviving by hundreds of thousands even though they had been clinically dead.*** *Specifically, every* ***cell emits mitogenetic radiation in the Ultraviolet range***

twice: when it is born and when it dies. The Ultraviolet Photon emitted at death contains the exact virtual state pattern of the condition of the cell at death. The healthy cells are bombarded with death messages from those that are dying, and this diffuses the death pattern throughout the healthy culture, eventually kindling into the same death pattern there." *- V.P. Kaznacheev, in "Distant Intercellular Interactions in a System of Two Tissue Cultures", Psychoenergetic Systems, March 1976.*

> ***"Various biological effects can be explained by unequal absorption of microwave energy by different tissues of the body, as well as by an excitation of some parts of a nervous system. This method is new and apparently powerful enough to estimate this absorption of electromagnetic energy from both qualitative and quantitative sides. Indeed, if the absorption of electromagnetic energy takes place in nerves and nerve cells, a negligible portion of the energy absorbed by the nerve is enough to produce a number of secondary phenomena in the body caused by the excitation of a nerve.*** *It is essential that such secondary processes occur due to a comparatively high internal energy of the body (for example, due to the energy of tissues, which are innervated by the 'modified' nerve in our experiments), but not due to a relatively insignificant absorbed external energy by the nerve. Thus,* ***all parts of the electromagnetic spectrum contains some bands, which act differently on biological objects, in particular, on the nervous system of a living organism. The search for radiation emitted by organisms represents the second way of finding biologically active waves and of clarifying the issues of absorption of the electromagnetic field. If the experiment confirms the existence of an active emitting of electromagnetic waves by a living organism, it is necessary to clarify the biological significance of it, since it is no matter how small is its intensity, it can be one of the strongest factors in the daily life of living organisms".*** *- S. Ja. Turlygin. in "Izluchenie mikrovoln (λ□2mm) organizmom cheloveka", Bulletin of Experimental Biology and Medicine, 1942.*

Dr Popp had begun experimenting with the idea: **If cancer-causing chemicals could alter the body's biophoton emissions, then it might be that other substances could reintroduce better communication. Dr Popp wondered whether certain plant extracts could change the character of the biophoton emissions from cancer cells to make them communicate again with the rest of the body. He began experimenting with a number of non-toxic substances purported to be successful in treating cancer.** In all but one instance, these substances only increased the photons from tumour cells, making them even more deadly to the body. **The single success story was Mistletoe, which appeared to help the body to "resocialise" the photon emissions of tumour cells back to normal.** In 1 of numerous cases, Dr Popp came across a woman in her 30's who had **Breast Cancer, and Vaginal Cancer. Popp found a Mistletoe remedy that**

created coherence in her cancer tissue samples. The woman stopped any treatment other than the **Mistletoe extract and, after 1 year, all her laboratory tests were virtually back to normal.** For Dr Popp, MD, **Homoeopathy was another example of photon sucking.** He had begun to **think of it as a "resonance absorber".** Homoeopathy rests upon the notion that **like is treated with like. A plant extract that at full strength can cause hives in the body is used in an extremely diluted form to get rid of it.** If a rogue frequency in the body can produce certain symptoms, it follows that a high dilution of a substance which can produce the same symptoms would also carry that frequency. Like a resonating tuning fork, a suitable Homoeopathic solution might attract and then absorb the abnormal oscillations, allowing the body to return to normal health. According to Dr Popp, the Body Meridian System transmits specific energy waves to specific zones of the body. Orthopaedic surgeon Dr Robert Becker, who has done a great deal of research on EM fields in the body, designed a special electrode recording device that rolls along the body. His many studies have shown **electrical charges on every one of the people tested corresponding to meridian points** ["The Field: The Quest for the Secret Force of the Universe", 2001].

Light in Human Consciousness

In a ground-breaking paper "Orchestrated Objective Reduction of Quantum Coherence in Brain Microtubules: The "Orch OR" Model for Consciousness", Mathematics and Computers in Simulation, April 1996, the **Brain is described as a quantum computer whose main architecture are the cytoskeletal microtubules and other structures within each of the brain's neurons.** If you examine a neuron, you will see that there are many hollow tubes surrounding the axon. These microtubules have been thought of as a kind of scaffold to support the Nerve Fibre. The particular characteristics of microtubules that make them suitable for quantum effects include their **Crystal-Like lattice structure, hollow inner core, organisation of cell function, and capacity for information processing.** According to the researchers, **their size appears perfectly designed to transmit Photons in the Ultraviolet range.**

> ***"Approaches to understanding consciousness which are based on known and experimentally observed neuroscience fail to explain certain critical aspects. These include a unitary sense of binding, non-computational aspects of conscious thinking, difference and transition between pre-conscious and conscious processing, (apparent) non-deterministic free will and the essential nature of our experience. We conclude that aspects of quantum theory (quantum coherence) and of a newly proposed physical phenomenon of wave function self-collapse (Objective Reduction, OR) offer possible solutions to each of these problematic features. We further conclude that cytoskeletal microtubules, which regulate intra-neuronal activities and have cylindrical paracrystalline structure, are the best candidates for sites of quantum action and OR,***

***and of "orchestrated OR" (Oreh OR)."** - in "Orchestrated Objective Reduction of Quantum Coherence in Brain Microtubules: The "Orch OR" Model for Consciousness", Mathematics and Computers in Simulation, April 1996.*

*"Traditionally viewed as the cell's "bone-like" scaffolding, microtubules and other cytoskeletal structures now appear to fill communicative and information processing roles. Theoretical models suggest **how conformational states of tubulins within microtubule lattices can interact with neighbouring tubulins to represent, propagate and process information as in molecular-level "cellular automata" computing systems."** - Hameroff, 1982; Rasmussen, 1990; Hameroff, 1992.*

In their paper (April 1996), Hameroff and Penrose present a model L**inking Microtubules to Consciousness** using quantum theory. In their model: **Quantum Eoherence emerges, and is isolated in brain microtubules** until a threshold related to quantum gravity is reached. The resultant self-collapse creates an instantaneous "now" event. **Sequences of such events create a flow of time, and consciousness. Internal Photons (Inner Light), Is Very Real, and Is The Basis of virtually All Human Cellular and Systemic Function.**

The U.S. Food and Drug Administration (FDA), has created an arduous, costly, and detailed process for market entry for Therapies.

Several years and many millions of dollars are required to get a drug or device approved. Typically, the drug is created in a laboratory and later tested to confirm the medical benefit. **"Medicine" has thus followed the "Science."**

One often finds, however, that Alternative Therapies are More Successful than Medical Trade procedures. Here, Light Therapy has first been shown effective, but to be approved for general use, time-consuming, expensive and exhaustive laboratory-based studies must be undertaken **to provide the "scientific proof".** It is also important to note that the Foundation is now working with Expanded Spectrum Photo Therapy (ESPT) and Low Level Light Therapy (LLLT), which have further implications regarding Photo Dynamic Therapy for Cancers and non-drug treatment for pain." - "The Foundation for Light Therapy", Charitable, Non-Profit Scientific and Humanitarian Organization 501(C)(3), USA., 2000-2015.

Healing Photons

"Blood Irradiation Therapy belongs to those ideas, that run contrary to currently accepted practice and hence often arouse bafflement, misunderstanding, consternation, and rejection. Thus is should not surprise us that no mention of Blood Irradiation Therapy is to be found in Standard Textbooks. A long-overdue **acceptance of Blood Irradiation Therapy could have a Major Impact on the Earning Prospects of Giant Corporations.** Therefore it is important to note that the history of Blood Irradiation Therapy is not merely the story of one more wonder drug. **It recounts the fledgling steps toward a shift.**

Many Specialists in the Treatment of Disorders:

1. **Chronic Hepatitis.**
2. **Necrotizing Pancreatitis.**
3. **Bronchial Asthma.**
4. **Pelvic Inflammatory Disease.**

Are unaware that Ultraviolet Blood Irradiation Therapy was used with superior effectiveness and safety 50 years ago to treat these conditions Photobiology; The Science of the Interaction of Light and Living Cells or creatures, is a Dynamic, Important Area of Biophysics.

Certain parts of it such as the organisation of the spectrum are quite straightforward and well-known, other parts, including the Potentially Therapeutic Responses of Cells To Incoming Light, are complex, and little understood.

1. Blood Irradiation Therapy offers a curious example of a scientific advance that was largely ignored, even though it offered an excellent solution to serious, pressing problems.

2. There are no serious critics of Blood Irradiation Therapy, and there never have been any.

3. Repeated studies have shown that Blood Irradiation Therapy operates by a physiological mechanism that goes will beyond any placebo effect.

4. Blood Irradiation Therapy offers insight into many aspects of Photobiology. It can help elucidate the mechanisms of the body's energy metabolism. And its patterns of action can aid us in understanding related therapies as well.

5. Blood Irradiation Therapy is highly effective, safe, and versatile. It has been exhaustively studied, and its mechanisms of action are well characterized. **Blood Irradiation Therapy has been successfully used on millions of patients in a number of countries, and in various difficult indications for which there is no other effective treatment.**

All of this: Augurs a bright future for this most efficacious therapy; The Therapy of the Healing Photons." - in "Healing Photons", 1998.

The Place of Diet and Ultraviolet Blood Irradiation Therapy in the Treatment of Cancer

"- Dr Miley: I wish to congratulate you, Senator Pepper, on the bill (S. 1875).

It is a wonderful thing, and I endorse it wholeheartedly. **All of us are here for the same purpose, regardless of how we approach the subject of cancer, and what our ideas are. In the way that good can be done for people.**

Diet Influences Cancer

I feel that the Gerson Dietary Regime Offers a new approach to the Cancer Problem. We do Know Experimentally that Diet Definitely Does Influence Cancer. There Is a Lot of Experimental work done, to substantiate that.

Dr Miley Statement, Together With the Signed Statements of Distinguished Physicians:

Dr George Miley - I graduated from Northwestern Medical School in 1932, University of Vienna Postgraduate Medical School, 1933-34, I visited the hospitals in India, China, and Japan.

Practiced Medicine and Surgery in Iowa, until January 1937.

I received Doctor of Medical Science from Hahnemann Medical College and Hospital of Philadelphia in 1941, for original Research in Ultraviolet Blood Irradiation Therapy. I have been in Medical Research, as Clinical Professor of Pharmacology, and Director of the Blood Irradiation Clinic.

I am a fellow of the American Medical Association, and American Association for the Advancement of Science. **Since August 1945, I am Medical Director of the Gotham Hospital, New York, in charge of Blood Irradiation Research,** and the representative of Dr Stanley Reimann, head of oncology (science of tumors), and pathology (science of abnormal anatomy)**, to observe and control as necessary, the experimental work of Dr Max Gerson in the study of the Clinical Effects of Diet on Cancer Patients** at the Gotham Hospital. During my research in the field of **Ultraviolet Blood Irradiation Therapy,** which experience includes the administration and use of the method over 8,000 times in more than 3,000 individuals, **many important clinical observations were made which were substantiated by other workers in the same field.**

Clinical Observations which have to do with the Cancer Problems:

1. Acute Pyogenic (pus forming) infections in, and around the Cancerous Area can be controlled better by Blood Irradiation Therapy than by any other known method.

2. The Acute Toxic Symptoms often present in cancer patients can best be controlled by Ultraviolet Blood Irradiation Therapy, which Is The Best Detoxicating Agent Known to modern medicine, according to the workers in this field. The Gerson Dietary Regime consists of low animal protein, plus frequent injections of crude liver extracts and the oral administration of adequate amounts of minerals and vitamins to supplement those vitamins missing in the diet. The Diet consists chiefly of large amounts of fresh fruit, fresh vegetables and no meat, alcohol, canned or bottled foods.

The Diet Burns Down to an Alkaline Ash, and in general, is a combination of many well-known and approved Dietary Nutritional Discoveries by many other workers.

The Closer one's Diet is to Nature and the Soil, with Fresh Fruit from the Trees, and Fresh Vegetables directly from the garden, the nearer one is to normal health.

Primary Biochemical investigations by Dr Rudolph Keller, indicate that the use of the Diet is Soon Followed by certain definite Electrochemical Changes; notably, shifts toward normal of markedly unbalanced sodium, potassium, and phosphorous ratios in the blood serum and the body tissues.

Dr Keller, as a result of his **investigation of the Diet,** believes that this type of E**lectrochemical Reaction, can very well Change the Entire Metabolism of the Body in Cancer Patients.**

A preliminary paper by Dr Gerson describes the diet in detail and cites 10 cases of cancer in which it appeared that the Gerson Dietary Regime; Favourably Influenced the Course, and Symptoms of the Disease.

This New Approach to the Cancer Problem Is Of Fundamental Importance, because it is the first promising method which treats cancer as a systemic disease; that is, a disease of abnormal chemistry of the whole body.

Heretofore, all efforts to treat cancer have been based upon the theory that eradication of the cancer growth must be performed by:

1. **Surgery.**
2. **X-Ray.**
3. **Radium.**

Without Regard for Abnormal Body Chemistry, Which Permits The Growth To Occur.

The reason that surgery, X-Ray, and Radium Have Not Been a real success in the Treatment of Cancer, is that Cancer Is Primarily a Disease of Abnormal Body Chemistry, Chemistry Which Is Controlled by Organs Far Distant From The Site Of The Cancer. The Gerson Dietary Regime Is An Encouraging Attempt To Return; such abnormal body Chemistry To Normal. I first met Dr Gerson in 1942, at which time **I was interested in the effects of the Gerson Diet on Tuberculosis.**

I visited his office in New York City, with Dr Charles Bailey, outstanding Philadelphia and New York Chest Surgeon, and **observed Several Tuberculosis Patients, who had made Remarkable Recoveries Following the Use of the Gerson Diet.** During this visit; **Dr Gerson mentioned the potential use of the Gerson Diet in Cancer.**

In the last 4 years I have found Dr Max Gerson to be an honest and ethical practitioner of medicine, interested in bettering modern methods of treatment, as the result of many years of clinical study of the effects of diet on various disease processes. **Since January 1946, we have, at the Gotham Hospital, extended hospital facilities, including a special Diet Kitchen to Dr Gerson, for a controlled study and observation of his work by physicians.**

The Results Are Most Encouraging.

There are certain definite problems to be overcome before any type of treatment of cancer can be considered partially or wholly successful.

Problems Which Are Not Solved By:

1. **Surgery.**
2. **Radium.**
3. **X-Ray.**

Those That Received No Medical Treatment Lived Longer

A Survey made by Dr Stanley Reimann of Cancer cases in Pennsylvania over a long period of time; Showed that:

Those Who Received No Treatment Lived Longer Than Those That Received Surgery, Radium, or X-Ray.

The exceptions were those patients who had received Electrosurgery, and lived approximately as long as those who received No Treatment Whatsoever.

The Survey also showed that following the use of Radium and X-ray, Much More Harm Than Good Was Done to the average cancer patient.

NONE of the routine measures employed [by the Medical Trade] to combat cancer are as effective as their proponents would have us believe.

These problems and new approaches to their solution:

1. The abolition of pain has been possible only by The Use of Narcotics, Which Are Deleterious to Any Patient's General Health when administered over a long period of time. This problem, has been solved more by the Gerson Diet than by any other method. We Have Observed Marked Relief of Pain in 90% of the patients who entered the Hospital, with Severe Types of Pain due to Cancer.

2. Further Spread of Cancer processes have been Retarded by the Use of the Gerson Dietary Regime in Several Cases observed.

3. Reduction in the Size of the original Malignant growth Has Been Observed to occur in certain instances following the use of the Gerson Diet.

4. Secondarily Disseminated Cancers from the original growth Has Not Been Observed, in the Gotham Hospital series. Patients seen in Dr Gerson's office, there was an apparent Disappearance of Metastatic nodules.

5. Control of Acute Pyogenic Infections (Pus Forming), in areas eroded by cancer, the Chief Cause of Death in a Cancer Patient. The Only Type of Treatment (in my experience), that Has Been of Any Use in the Control of this Type of Infection is Ultraviolet Blood Irradiation Therapy, though only offering a temporary relief of 3 to 4 weeks' duration, is of Extreme Importance to the welfare of the individual patient, especially where the patient's general health must be raised to a level high enough To Allow the institution of Other Treatment such as the Gerson Dietary Regime.

6. Acute Toxic Symptoms, such as Nausea and Vomiting, which is commonly observed in a considerable number of cancer patients May Be Temporarily Alleviated by Ultraviolet Blood Irradiation Therapy. This result, though often only temporary, Allows the Institution of Other Therapy which otherwise might not have been possible and as such has a limited but definite value in the treatment of a cancer patient.

7. Hemorrhage due to erosion by cancer masses; is a frequent cause of death. Its control Is Only Possible, if there is no spread from an original cancer or there is a reduction in the original tumor or its metastases. To date; the Gerson Diet Is Of Value in the Control of Hemorrhage, only to the extent to which it limits directly the encroachment of cancer masses upon important blood vessels.

8. General Debility (and especially loss of weight), have been frequently Overcome by both the Gerson Dietary Regime, and Ultraviolet Blood Irradiation Therapy, which may be used together without any contraindications whatsoever. As a result many formerly debilitated patients were able to do normal work again.

9. The Maintenance of the Morale of the cancer patient; Is of Primary Importance At All Times. When any one, or any combination of the previous 8 problems are solved for the individual cancer patient, his morale is enormously improved so that the practical solution of one or more of these problems must be accomplished wherever possible regardless of whether the patient is considered a hopeless case of cancer or not.

Next, we must consider the problems to be overcome in the prevention of cancer: The discovery of the various causes of the various types of cancer.

From clinical observations on cancer patients, the Gerson Dietary Regime provides a most promising lead.

In order to profit from this knowledge an enormous amount of collateral biochemistry must be carried out intensively, on both cancer patients and cancer animals by competent workers who are equipped with science's most up-to-date tools for such work.

There are many great institutions doing this work. Prominent among them are the Lankenau Research Institute of Philadelphia, the National Health Institute of Bethesda, Md., Rockefeller Institute, and many others.

There are no special cancer hospitals, as yet doing this highly specialized work in biology and biochemistry to any appreciable degree though they should be encouraged to do this fundamental work in close relation to their carrying out the **Not Too Successful Routine Treatment of Cancer by: Surgery, Radium, and X-Ray.**

Recently a medical research foundation has been organized which recognizes the value of the 2 new avenues of approach to cancer (**Gerson Dietary Regime, and Ultraviolet Blood Irradiation Therapy**), and is now in the final stages of legalization. **Such work often has been considered unimportant** or unorthodox by existing avenues of research that **have remained closed to many worthwhile scientific workers.**

The foundation will be devoted to the correction of the deficiency which allows, in our present American research practice, **this delay of action in making known and clinically applicable important basic discoveries.**

In the very near future it is proposed to set up within the structure of the Foundation, an Institute of Dietetics, devoted to the careful correlation of all Biochemical Knowledge pertaining to the Influences of the Diet on Cancerous Growth and its various detrimental effects; at the Foundation's Institute of Dietetics, this knowledge of its practical application will be taught to those dietetians, nurses, technicals, physicians and other cancer research workers who are interested in its approach to solving the problem of the Cure and Prevention of Cancer. Such a foundation also insures both the hospital, and the laboratory facilities which are so essential for the testing of new treatments which may conceivably influence favourably the course and symptoms of cancer.

In such an environment a carefully controlled evaluation of promising methods of treatment of human cancer would be made available.

The History of Medicine is Filled with Tragic Errors, which allow such a long time to elapse between the time of discovery of a basic principle and the actual medical application of the discovery for the good of mankind.

> ***"Nowhere today is this delay more unhappily evident than in the field of cancer research.***
> ***The Accumulated Clinical Research Data of : Rous, Shope, Coley, Bittner, Strong, Andervont, Green, Greene, Williams, Taylor, Furth, Twombly, Cowdry, Diller, Bawden, Pirie, Stanley, Wycoff, Kunitz, and Others;***
> ***Indicate Beyond Peradventure The Path for getting at Something of Practical Benefit to the Cancer Patient of the future, Other Than Surgery, and Radium."*** *- Dr Hammett, in "Science, Vol. 103 , No. 2685, p. 714.*

Even the newly announced Radioactive Phosphorous Cure of skin cancer, and skin cancer only does not approach the deeper body cancer problem from a systemic or fundamental point of view.

It Is Obvious that the Many Potentialities Inherent in the Gerson Dietary Regime for cancer patients should be explored, and exploited to the Fullest Extent for the Common Good.

In order that this new and highly encouraging approach to the problem of cancer cure, and prevention be utilized on a statistically significant scale by both laboratory and clinical workers alike, sufficient funds must be made available for this work. This Also Holds True for the Use of Ultraviolet Blood Irradiation Therapy, in Controlling Secondary Infections, and certain Toxic Symptoms in Cancer Patients.

These Observations Have Become Apparent to Several Distinguished Physicians who have Witnessed the Effects of the Gerson Diet on Cancer patients, and whose Signed Statements are also herewith enclosed.

In View of the Success so far, and the excellent future promise of both the Gerson Dietary Regime and Ultraviolet Blood Irradiation Therapy, it would be unthinkable not to give major consideration to these new avenues of approach to the cancer problem in the research program contemplated by bill S. 1875." - Dr George Miley, MD, Medical Director, Gotham Hospital, New York , N.Y., 29 June 1946, in "Cancer Research: Hearings Before a Subcommittee of the Committee on Foreign Relations, United States Senate, 79th Congress, 2nd Session, on S. 1875, Bill to Authorize and Request the President to Undertake to Mobilize at Some Convenient Place in the United States an Adequate Number of the World's Outstanding Experts, and Coordinate and Utilize Their Services in a Supreme Endeavor to Discover Means of Curing and Preventing Cancer, 1 to 3 July 1946.

Electrical Current Heals Chronic Wounds

"Chronic Wounds Treated With Very Low Electrical Currents: Heal More Quickly than they do with standard treatments, a new study suggests.

Researchers studying the ElectroRegenesis Therapy Device (ERTD), it Stimulates the Body's Natural Ability to Heal:

1. **Wounds.**
2. **Long-term Ulcers.**
3. **Diabetic Lesions.**
4. **Circulation Problems.**
5. **Paralysis.**
6. **Ageing.**

Several patients, some of whom had had wounds for 5 Years; Showed Significant Healing in just 1 or 2 Sessions.

The promising study, presented recently at the 8th International Congress American Academy of Anti-Aging Medicine, may spell painless relief for the estimated 2% of Americans living with wounds that don't heal.

> ***"What We do Understand; is that the Device seems to Act as:***
> ***1. Ultra-Powerful Antioxidant, that Knocks Out Infection.***
> ***2. Stimulates Blood Flow.***
> ***3. Encourages Cell Regeneration."*** *- Dr Alfred J. Koonin, MD, in Clinical Study Monitor for the ElectroRegenesis Therapy Device.*

And it also appears to help patients regardless of their age, says Dr Koonin, MD, Los Angeles. Chronic Wounds, are those that show no sign of healing in 4 weeks, or have not significantly healed in 8 weeks, says Kristin Winbigler, Director of the Wound Care Center at Stamford Hospital, Connecticut.

> ***"With Diabetics, there is a high glucose level in the tissue, that interferes with healing. When you bump into something, it would heal. For them, it's a bigger problem."*** *- Dr Kristin Winbigler, MD*

The study observed 25 wounds in patients ranging in age from 20 to 75.

For 23 minutes a day, they were wrapped in spongy, damp bandages above and below the wound. The researchers then wrapped Electrodes over the bandages and attached them to the device, which delivered a Low Electrical Current, Similar to that Present Naturally in the Body. After 23 minutes, wraps were applied to their feet and the treatment continued for 3 more hours.

Most of the patients received treatments 5 days a week for about 2 weeks. The average rate of healing was about three-quarters of a centimetre each day of treatment. Wounds that had not responded to conventional therapy, for months healed, within a few weeks, researchers found. Dr Koonin says The Therapy Kick Starts the Body's Natural Energy Source, Which Is Essential to Healing.

> ***"It takes an electrical system that's out of whack and sort of normalizes it."*** *- Dr Koonin, MD*

Dr Koonin says some of the Device effects are a little mystifying. While conventional therapies often require surgical or chemical removal of any dead tissue before treatment begins, Dead Tissue Seemed to Disappear After Treatment with the ElectroRegenesis Therapy Device.

> ***"It seemed to be reabsorbed by the body or converted to new tissue. It's difficult to tell which. My own feeling is it was probably reabsorbed into the body, but we don't know."*** *- Dr Koonin, MD*

A slight rash around the wound, was the only negative side effect noticed in some patients. But Dr Koonin says the treatments also seemed to have another positive side effect.

> ***"Many of them got a little brighter, particularly Older Patients, Paraplegics and Quadraplegics. Their appetites started to resume. It's the sort of thing you'd expect from an antioxidant. It sort of cleans up the tissue. They Felt Better."*** *- Dr Koonin, MD*

Dr Koonin believes the ElectroRegenesis Therapy Device (ERTD), will have many applications. Some animal testing on spinal cord injuries is being done, and trials are planned to test its effects on severe Facial Pain, Shingles and Poor Circulation. Dr Winbigler, says wound-care centers offer a wide range of therapies for people with chronic wounds. The incidence of Chronic Wounds and the demand for new Wound-Care products Are Expected to Increase in coming years. The market for new therapies in wound-care management is expected to grow from $455 Million in 1999 to $2.4 Billion in 2006, according to a report this month by industry research Frost & Sullivan." - in "Electrical Current Heals Chronic Wounds", HealthScout, 28 December 2004.

Wound Care Spending $300 Billion

> ***Global Wound Care spending estimated at $300 Billion Annually. 'The United States leads the way with over $148.65 Billion annually, followed by China $42.78 Billion, Germany $23.33 Billion, Japan $22.91 Billion, UK $10.1 Billion in 2019, per year and take up 50% of Community Nurse Time. Mean National Health Service cost of wound care over 12 months was £7,300 per wound, from £6,000 to £13,700 per healed and unhealed wound, respectively."*** *- in "Human Wound and Its Burden: Updated 2025 Compendium of Estimates", Advances in Wound Care, September 2025; NIH ; NHS.*

The Quantum Cell Membrane

"What is life?

Life begins where the environment first meets you: This happens on the surface of a cell's membrane. Life Begins by Creating Wireless Power Transmitters in our surface membranes that work by collecting magnetic resonance and induction from our environment. This is how life becomes super charged. Sunlight, like sound, creates vibration in atoms in the air and in cell membranes and is fully able to transfer energy and information of these oscillations. This makes your skin and cell membranes a universal wireless charging system. That system is fed by the magnetic field and photons of the sun. Photons are released from electrons after they are energized by the sun then fall back to the ground state by giving off a photon to our tissues.

The Biochemical Interaction Between Dihydroxyacetone (DHA) and Adenosine Triphosphate (ATP)

Docosahexaenoic Acid (DHA) is an omega-3 fatty acid that can affect Adenosine Triphosphate (ATP) production, while Dihydroxyacetone (DHA) is a simple sugar that is phosphorylated using Adenosine Triphosphate (ATP) by certain enzymes.

Docosahexaenoic Acid (DHA) is the lipid that does this most effectively. It is this light that drives biochemical flux, and not Adenosine Triphosphate (ATP).

There are about 100,000 chemical reactions happening in every cell each second. The chemical reaction can only happen if the molecule which is reacting, is excited by a photon. Once the photon has excited a reaction, it returns to the field of play in a cell and is available for more reactions at the speed of light. We evolved in an ocean of light oscillations. Since we can only see and hear a very small bandwidth of wavelengths we are blind and deaf to most of the magic that happens all around us. They occupying other wavelengths at small scales and your cell membranes do sense them.

For example, if you don't believe oscillations are capable of transferring energy, you should know that ultrasound oscillations are silent and highly energetic. They can be used to heal bones by itself. I know because I use it to do this in my clinic.

Life begins at the cell membrane level.

The environment meets our cells at the cell membrane.

In a cell, collagen is a biological nanowire that forms a tensegrity structural skeleton that links the cell membrane to the nucleus.

It is flexoelectric and piezoelectric, and so are our cell membranes.

Water makes up 99% of the molecules in a cell because it is a small sized molecule. Water Is The Battery of Life.

It is a repository for electromagnetic solar radiations. Water interacts most with the Infrared (IR) part of the electromagnetic spectrum of our sun. Once Infrared (IR) light hits the water it shrinks while it increases its Exclusion Zone (EZ). Theses are the givens in life's thermodynamic quantum puzzle.

It All Begins With The Cell

All living organisms are made up predominantly of dipolar molecules and dielectric molecules that are packed densely together and are extremely dynamic in their relationships to one another. They represent special solid-state systems where electromechanical and viscoelastic forces constantly interact to alter sizes and shape to control energy flows in a system that is metastable of far from equilibrium. Under these conditions, energy from the oxidation of foods, the sun's light, and the vibrations of the Earth's motion's could "pump" up the system, resulting in collective modes of vibration to become trapped in cell membranes like a giant capacitor of energy.

They key for life, is ramping up this stored energy to create subatomic particles that become coherent so that at night time when the matter in us is its most condensed we can align all those oscillations and waves to act in phase and create massive energy flows that create the spark of life in the condensed matter in us. This is precisely what a laser does.

Our cellular membranes typically have an enormous electrical field of some 107 V/m across them. A substantial proportion of the intracellular volume is also taken up by organelles such as the mitochondria, where foods are oxidized to Carbon Dioxide (CO2), and Water (H2O) with the occasional generation of Adenosine Triphosphate (ATP) mostly during the day, and ribosomes on which polypeptide chains are synthesized by ubiquination signaling.

Royal Raymond Rife, is known for his microscopes, which he claimed could observe live microorganisms with a magnification considered impossible for his time, and for an "oscillating beam ray" invention, which he thought could treat various ailments by "devitalizing disease organisms" using radio waves.

In the 1930's, he claimed that by using a specially designed optical microscope, he could observe microbes which were too small to visualize with previously existing technology. Rife also reported that the "beam ray" device could weaken, or destroy the pathogens by energetically exciting destructive resonant frequencies in their constituent chemicals. Today, we have companies, showing us that certain frequencies and their resonant frequencies can have a massive effect on the biology of cells. It is time to rethink our truths because we are on the wrong scale of science to see how things really work.

Science is showing us that pushes, and pulls on a cells tensegrity system.

Mitochondria are the ultimate antenna/sensor for magnetoelastic oscillations that act as quantum heat engines." - in "Tensegrity No.12: The Quantum Cell Membrane", 14 December 2014.

The Beneficial Effects of Microcurrent Therapy on Muscle Damage

"This study was undertaken to investigate **the efficacy of Ultra-Low Microcurrent** delivered by the Electro Pressure Regeneration Therapy (EPRT) device for **the management of Chronic Wounds,** 23 patients with chronic skin ulcers, and 2 with abdominal dehiscence that was present for an average of 16.5 months, who were not responsive to standard conservative treatment in a hospital setting, were treated with the Electro Pressure Regeneration Therapy (EPRT) device. Wounds were treated with direct current (maximum of 3 mA) of 1 polarity for 11.5 min and then with a current of the opposite polarity for another 11.5 min.

Treatment was applied through ultra-low microcurrents (in the mA to nA range) conducted through special wraps applied above and below the wound.

The results revealed **that 34.8% of cases achieved complete wound healing after an average of 45.6 hours of treatment**, and **39.1% achieved 50% healing after an average of 39.7 hours of treatment.**

Several patients Achieved Significant Results after 1 to 2 treatments.

The Electro Pressure Regeneration Therapy device Accelerated Healing and also appeared to negate (counteract the outcome) the effect of a person's age on wound healing. Cells have complex electricity that is sensitive to changes in electrical fields. Metabolic, immunologic, and physiologic changes have been found to develop in different cell cultures after electrical current is applied.

Endogenous Bioelectricity, which includes electrical current and electrical potential, Is Essential For Life.

Electrical fields have been shown to control the direction and rate of epithelial cells that migrate into the wound.

Acustat Electro-membrane Microcurrent Therapy has been used to treat postoperative pain and soft tissue injury; however, its efficacy in reducing symptoms of muscle damage is not known.

In a Study "Electro-membrane microcurrent therapy reduces signs and symptoms of muscle damage", Medicine & Science in Sports & Exercise, April 2002, Accustat Electro-membrane Therapy reduced the severity of symptoms in 30 healthy men with induced muscle damage.

Direct and indirect evidence suggests that free radicals play a key role in normal biologic function and in the pathogenesis of certain human diseases. **Oxidative stress as a consequence of an imbalance in prooxidant-antioxidant homeostasis in chronic wounds is thought to drive a deleterious sequence of events, finally resulting in the non-healing state.**

Tumor Necrosis Factor - a biosynthesis has been shown to be reactive oxygen species – inducible as well.

Actually, the device used in this experiment **was supposed to deliver electrons to tissues and then to saturated free radicals with required electrons.**

The fact that these electrons are focused on a small region of the body may explain why healing changes appeared so rapidly.

The actual tissue regeneration coupled with absence of the age factor in healing, along with concomitant improvement noted in the general condition of the patient, points to a highly potent antioxidant effect on local tissues, as well as on tissues in general.

This reduces free radicals and might facilitate tissue repair." - "Ultra-Low Microcurrent Therapy: A Novel Approach for Treatment of Chronic Resistant Wounds", in Advances in Therapy, November/December 2007.

Ultra-Low Microcurrent in the Treatment of Disease

"The results of this preliminary trial showed that Ultra-Low Microcurrent has Therapeutic effects on:

1. Diabetes.
2. Hypertension.
3. Wound Healing.

Presumably, one of mechanisms of action is its antioxidant activity.

The action of Electro Pressure Regeneration Therapy is to produce electrical pressure rather than an electrical jolt as produced by a Transcutaneous Electrical Nerve Stimulator.

This steady stream of electrons is what makes the Electro Pressure Regeneration Therapy a super antioxidant and not only does this correct malalignments in the cells electrical system but it also eliminates free radicals and then stimulates the mitochondria to produce Adenosine triphosphate (ATP). Microcurrent has been successfully used to enhance soft tissue healing and to treat Fracture Nonunion (broken bone that is not healing).

Microcurrent relieves Myocontracture (muscle contracture), and can enhance conventional rehabilitation programs for children with Cerebral Palsy.

Studies from the 1980s suggest that **Microcurrent Therapy is effective at relieving the side effects of radiation therapy.**

The investigators have found that **direct Electrical Therapy was effective in healing Gum Abscess, and Accelerated Wound Healing.**

Substances that **increase electrical field, such as prostaglandin E2, enhance the wound healing rate and increase cell division.**

Electrical fields stimulate secretion of growth factor.

Low mA current stimulates Adenosine Triphosphate (ATP) production.

It is discovered in another study that **Microcurrent stimulates dermal fibroblasts** and U937 cells to secrete transforming growth factor-β1, **a major regulator of cell-mediated inflammation and tissue regeneration.**

Oxygen free radicals play a major role in the failure of ischemic wound healing, while antioxidants partly improve the healing in ischemic skin wounds.

Oxygen free radicals mediate the inhibition of wound healing following Ischemia-Reperfusion [tissue damage that occurs when blood supply returns to an organ after a period of oxygen deprivation (Ischemia)], and Sepsis.

It seems that Diabetes Mellitus, Cardiovascular Disease, such as Hypertension, and Delayed Wound Healing, Have a Common important basic pathogenesis, which is related to Imbalance Between Free Radical Production and Removal.

The use of Ultra-Low Microcurrent might help in stabilizing mitochondria, working as antioxidants and therefore, enhancing normal function of β-cells and vascular tissue.

Treatment with Vitamin E, Vitamin C, or Glutathione

Several clinical trials have demonstrated that **Treatment with Vitamin E, Vitamin C, or Glutathione improves insulin sensitivity in insulin-resistant individuals.**

The acute effects of hyperglycemia-dependent endothelial cells dysfunction are counterbalanced by antioxidants.

Conclusively, oxidative stress and oxidative damage to tissues are common pathology of chronic diseases, and using antioxidants, such as the Electro Pressure Regeneration Therapy device used in this experiment, might change the concept of management of chronic diseases.” - Dr Bok Y. Lee, MD, FACS, Professor, Department of Surgery, New York Medical College, in “Ultra-low Microcurrent in the management of Diabetes Mellitus, Hypertension and Chronic Wounds: report of twelve cases and discussion of mechanism of action”, International Journal of Medical Sciences, 6 December 2009.”

The Efficacy & Antioxidant Effects of Ultra-Low Microcurrents

“Otto Van Guericke, who rotated a ball of solidified sulfur to create static electricity in 1672, invented the first electrical instrument in the present civilisation. Amber was the first material used to generate electricity, which could be generated by rubbing it with the hands. Static electricity machines were the first instruments and, with the machine age by the 18th century, **were powerful enough to destroy superficial tissue and be used for cauterization. Ultraviolet Ray machines invented by Strong in 1897 were still in use in 1937. The healing effects of electricity have always been ill understood. In order to understand how electrical currents can function as an antioxidant, the formation and effects of free radicals and their interaction with antioxidants needs to be understood.**

Oxidation and the formation of Free Radicals

We know that the atom is made up of protons, neutrons and electrons.

An inert Oxygen molecule is stable because the outer shells contain 8 electrons arranged in 4 pairs. When molecules with weak bonds split they can leave atoms with unpaired electrons, which is what free radicals are. This produces an atom or molecule looking for an electron to make up a stable pair.

In the 1840’s Michael Faraday discovered that Oxygen is attracted to a magnet. In 1925 Robert Millikan explained why Oxygen is magnetic using the then recently developed quantum theory.

The chemical reactions leading to this are either oxidation or reduction.

Oxidation is a loss of electrons while reduction is a gain of electrons.

In the initiation phase free radicals are formed from molecules readily giving up their electrons. **An example of this is hydrogen peroxide.** In the propagation phase the chain carrying radicals are alternately consumed and produced. In the termination phase the free radicals are destroyed. Thus without termination by an agent such as an antioxidant, a single free radical can damage numerous molecules. A certain amount of oxidative function is necessary for proper health.

For example, oxidative processes are used by the immune system to kill microorganisms. Sometimes, however, the level of toxic reactive oxygen intermediates overcomes the antioxidative defenses of the host resulting in an excess of free radicals and a state called oxidative stress. **These Free Radicals can induce local injury by reacting with lipids, proteins and nucleic acids.**

The interaction of free radicals with cellular lipids leads to membrane damage and the generation of lipid peroxide by-products.

Antioxidants and their effects on Free Radicals

Antioxidants are chemicals that have the ability to donate electrons without becoming free radicals themselves. Cells contain a number of antioxidants that have various roles in protecting against free radical reactions. The major water-soluble antioxidant metabolites are Glutathione (GSH) and Vitamin C, which reside primarily in the cytoplasm and the mitochondria.

Glutathione

Glutathione is a tripeptide made up of glutamic acid, cysteine and glycine covalently joined end-to-end. Glutathione peroxidase is an enzyme that catalyzes the reaction between Glutathione (GSH) and hydrogen peroxide leading to water and Oxidized Glutathione (GSSG) that is stable.

Glutathione (GSH) and Vitamin C

Glutathione (GSH) and Vitamin C act synergistically as a powerful antioxidant pair, where Vitamin C helps recycle oxidized glutathione back into its active, reduced form, enhancing the body's ability to combat oxidative stress.

Together, they improve detoxification, support immune function, and boost overall antioxidant capacity.

Vitamin E

Vitamin E and the carotenoids are the main lipid-soluble antioxidants.

Vitamin E is the major fat-soluble antioxidant in cell membrane and can break the chain of lipid peroxidation. Despite the actions of antioxidant nutrients, some oxidative damage will occur and accumulation of this damage throughout life is believed to be a major contributing factor to aging and disease.

Mitochondria and their role in Free Radical Damage

The cell is a complex structure. **The mitochondrion is where most of the action takes place. This is the powerhouse of the cell, and is where free radicals can do most of their damage. The Food we Eat is oxidized to produce high-energy electrons**, that are converted to stored energy. **This energy is stored in high-energy phosphate bonds in the form of Adenosine Triphosphate (ATP).**

The Electron and its Role in Electric Currents

The oxidative process takes place at a subatomic level with the electron being the main player. Electrons are the smallest of the charged subatomic particles.

In order for an electric current to flow it needs a pathway called a conductor.

Etiology of Chronic Wounds

Results: 92 % of the lesions were stages 3 or 4.

The age of the lesions varied from 6 to 60 months, with an average of 18.5 months.

100% of the Lesions Healed in an average of 48 hours of Treatment, i.e. an average of 16 days.

Conclusion

In conclusion: 25 Chronic Skin Ulcers present for an average of 18.5 months and not responding to standard conservative treatment in a hospital setting were **Treated with the Ultra-Low Current, Ultra-Low Frequency Device.**

1. **100% showed response to the treatment.**
2. **100 % healed in a maximum time of 7 weeks.**
3. **Average time of healing was 48 hours of treatment over 16 days.**
4. **Surgical debridement was unnecessary as the necrotic tissue appeared to disappear spontaneously.**

It has also been known that **the lower the frequency of an electrical device, the more permanent the effects of that device.** This observation was borne out in this study.

None of the healed lesions has shown any sign of recurrence to date after a period ranging from 6 to 18 months.

From what we know about the effects of free radicals and the mechanism of antioxidants in neutralizing them, **we can see a remarkable similarity in the action of the ultra-low currents used in this study.** The steady flow of electrons in a relatively low concentration appears to act exactly as one would expect from any antioxidant. The fact that these electrons are focused on a small region of the body may explain why healing changes appeared so rapidly.

The actual regeneration of the tissue coupled with the absence of the age factor in healing and the concomitant improvement noticed in the patients' general condition all point to a highly potent antioxidant effect on the local tissues as well as generally.

There is enough evidence to show that a low concentration steady stream electron flow produced in the manner described acts as a highly potent antioxidant that can be focused to any area of the body.

This study opens a door to studying this type of technology in the many disease processes that are initiated by free radicals." - Dr Bok Y. Lee, MD, FACS; Dr Alfred J. Koonin, M.B., FRCS; Dr Keith Wendell, Ph.D.; Nurse John Hillard, RN, in "The Antioxidant Effects of Ultra-Low Microcurrents", December 2000.

Necrotic Tissue Regenerate

"ElectroRegenesis Therapy Device successfully healed the most stubborn chronic wounds in 6 weeks or less. It also Regenerated Necrotic Tissue, making surgical intervention unnecessary, according to the results of a study "The Antioxidant Effects of Ultra-Low Microcurrents" presented at The American Academy of Anti-Aging Medicine's 8th International Congress in Las Vegas, December 2000. The ElectroRegenesis Therapy Device (ERTD) manufactured by ElectroRegenesis in Pacific Palisades, CA, **holds great promise to heal wounds more quickly and thoroughly than currently available standard treatments.**

The study, led by Dr Bok Y. Lee, MD, FACS, Professor of surgery at New York Medical College [Surgeon and medical researcher renowned for his lifetime of work in surgical care and spinal cord injury], included 25 Chronic Wounds with an average duration of 3 years not responding to standard conservative treatment.

Wounds included:

1. **Long-term Decubitus Ulcers.**
2. **Amputations.**
3. **Diabetic lesions.**
4. **Paraplegic wounds.**
5. **Quadriplegic wounds.**

All 25 patients were hospital inpatients.

The Wounds were treated with a direct current of a maximum of 4 milli-amperes of one polarity for 11 minutes, and then the current of the opposite polarity for another 11 minutes. A single treatment lasted 31/2 hours. Patients received 5 treatments per week, **until their wounds healed completely.**

The average time to complete wound healing was 14 treatments, or about 3 weeks of treatment 5 times a week.

> ***"The longest time a patient took to heal was 6 weeks."*** *- Dr Alfred J. Koonin, MD*

> *"The ERTD represents a major advancement for treating the most* ***Chronic, Treatment-Resistant Wounds. The device is a safe, non-invasive therapy for a range of serious, difficult-to-treat health problems."*** *- Dr Bok Y. Lee, MD, FACS*

ElectroRegenesis Therapy Device Eliminates Surgery

Researchers also found **ElectroRegenesis Therapy Device eliminates the need for surgical debridement of necrotic tissue.**

To qualify for the study, patients had to have had a Chronic Wound that failed to respond to standard treatment for at least 3 months.

Patients continued their current wound management treatment while receiving ElectroRegenesis Therapy Device stimulation.

Before ElectroRegenesis Therapy Device treatment, foam bandages soaked in ordinary tap water are wrapped above and below the wound.

A black silicon bandage is wrapped over the foam bandage and wires leading from the ElectroRegenesis Therapy Device are clipped to the silicon bandage.

Dr Koonin notes that **physicians who had been treating these patients "were more than surprised" at How Quickly and Completely the Wounds Healed.**

> ***"Several patients had significant Improvement in 2 treatments. None of the patients required surgery. Necrotic Tissue appears to Regenerate. About half the patients in the study had some Dementia. As a side effect of treatment, we noticed Significant Improvement in their Cognitive Behavior As Treatment Progressed."***

One unexpected side effect Dr Koonin hopes will be better understood as results from the multi-center study are analyzed, is **the cognitive improvement seen in several patients with dementia** included in the initial 25-patient study." - in "Device heals chronic wounds quickly", Clinician, 1 March 2001.

> ***"A number of studies on Wound Healing have explained the cellular repair observed to Ultra-Low Microcurrents acting as Mega-Anti-Oxidants that donate electrons to free radicals to transform them back into stable molecules and contain or even reverse this DNA damage at the molecular level."*** *- Dr Bok Y. Lee, MD, FACS, in "Noninvasive Assessment of Visco-Elasticity in the Presence of Accumulated Soft Tissue Fluid", Journal of Surgical Research, September 2007.*

The Therapeutic Value of Light and Colour

"In the effort to obtain relief from suffering, many of the more simple but potent measures have been overlooked

Sunlight is the basic source of all life and energy upon earth.

Deprive plant or animal life of light, and it soon shows the lack and ceases to develop. Place a seed in the very best of soil or a human being in a palace, shut out the light, and what happens?

Without food, man can live many days; without liquids a much shorter time; but not at all without the atmosphere which surrounds him at all times and to which he pays so little attention.

The Forces on which life mostly depends, are placed nearly or quite beyond personal control.

For centuries scientists have devoted untiring effort to discover means for the relief or cure of human ills and restoration of the normal function.

Yet **In neglected Light and Colour There Is a Potency Far Beyond that of drugs and serums.**

In order that the whole body may function perfectly, each organ must be working.

When the spleen, the liver, or any other organ falls below normal, it simply means that the body laboratories have not provided the required materials with which to work, either because they are not functioning, as a result of some disorder of the internal mechanism, or because they have not been provided with the necessary material. Before the body can appropriate the required elements, they must be separated from the waste matter.

Each element gives off a characteristic colour wave.

The prevailing colour wave of hydrogen is red, and that of oxygen is blue, and each element in turn gives off its own special colour wave.

Sunlight, as it is received by the body, is split into the prismatic colours and their combinations, as white light is split by passage through a prism.

Everything on the red side of the spectrum is more or less stimulating, while the blue is sedative. There are many shades of each colour, and each is produced by a little different wave length. Just as sound waves are tuned to each other and produce harmony or discords, so colour waves may be tuned, and only so can they be depended on always to produce the same results.

If one requires a dose of castor oil, he does not go to a drug store and request a little portion from each bottle on the shelves.

I see no virtue, then, in the use of the whole white light as a therapeutic measure when the different colours can give what is required without taxing the body to rid itself of that for which it has no use, and which may do more or less harm. If the body is sick it should be restored with the least possible effort.

There is no more accurate or easier way than by giving the colour representing the lacking elements, and **the body will, through its radioactive forces, appropriate them and so restore the normal balance.**

Colour is the simplest and most accurate therapeutic measure yet developed.

For about 6 years I have given close attention to the action of colours in restoring the body functions, and I am perfectly honest in saying that, after nearly 37 years of active hospital and private practice in medicine and surgery, I can produce quicker and more accurate results with colours than with any or all other methods combined - and with less strain on the patient. **In many cases, the functions have been restored after the classical remedies have failed.** Of course, surgery is necessary in some cases, but **results will be quicker and better if colour is used before and after operation. Sprains, bruises and traumata of all sorts respond to colour as to no other treatment. Septic conditions yield, regardless of the specific organism. Cardiac lesions, asthma, hay fever, pneumonia, inflammatory conditions of the eyes, corneal ulcers, glaucoma, and cataracts are relieved by the treatment.The treatment of carbuncles with colour is easy compared to the classical methods. One woman with a carbuncle involving the back of the neck from mastoid to mastoid, and from occipital ridge to the first dorsal vertebra, came under colour therapy after 10 days of the very best of attention. From the first day of colour application, no opiates, not even sedatives, were required. This patient was saved much suffering, and she has little scar. The use of Colour in the Treatment of Burns is· well worth investigation by every member of the profession. In such cases the burning sensation caused by the destructive forces may be counteracted in from 20 to 30 minutes, and it does not return.**

True burns are caused by the destructive action of the red side of the spectrum, hydrogen predominating. Apply Oxygen by the use of the blue side of the spectrum, and much will be done to relieve the nervous strain, the healing processes are rapid, and the resulting tissues soft and flexible.

In a very extensive burn in a child of 8 years of age there was almost complete suppression of urine for more than 48 hours, with a temperature of 105 to 106 degrees. Fluids were forced to no effect, and a more hopeless case is seldom seen. Scarlet was applied just over the kidneys at a distance of 18 inches for 20 minutes, all other areas being covered, 2 hours after, the child voided eight ounces of urine. In some unusual and extreme cases that had not responded to other treatment; normal functioning has been restored by colour therapy.

At present, therefore, I do not feel justified in refusing any case without a trial. Even in cases where death is inevitable much comfort may be secured.

There is no question that light and colour are important therapeutic media, and that their adoption will be of advantage to both the profession and the people." - Dr Kate W. Baldwin, MD, FACS, Senior Surgeon, Woman's Hospital, Philadelphia, in "The Therapeutic Value of Light and Color", Atlantic Medical Journal, April 1927.

What Is Light Therapy?

"The most appropriate name for Light Therapy is probably: "Photoluminescence." So extensive has the research been in this area, and so varied the researchers, that it has been called by several names. The following terms are used interchangeably to indicate the Photo-Oxidative Process:

1. Ultraviolet Blood Irradiation
2. Hemo-irradiation
3. Photoluminescence
4. Photopheresis
5. Photochemotherapy
6. Photobiological Therapy
7. Photo-oxidation (Douglass)
8. Photon Pump
9. Photodynamic Therapy

Dr George Miley was a clinical physician who practised Photoluminescence extensively in the 1930's. **His work clearly demonstrated another important effect of Light Therapy; an Increase of Oxygen Absorption by the Blood following Ultraviolet exposure. Dr Miley also reported on 151 consecutive unselected cases of acute infection treated by photoluminescence.** The results were phenomenal. **In those cases that were treated early, 100% of the patients recovered fully. In moderately advanced cases, 98% recovered; even patients who were moribund (near death) experienced a 42% recovery rate.**

Hancock and Knott presented the following explanations of why they found **Ultraviolet Irradiation of the blood to work:**

1. Coagulation of bacteria caused by the creation of an "autogenous [self-generating] vaccine."
2. Increased germicidal properties of the blood and an increased number of antibodies (we call this effect "stimulation of the immune system").
3. Secondary radiation by treated blood cells (luminescence).
4. Increase of Vitamin D content and Cholesterol in the Blood Plasma.
5. Increased oxygen absorption by the blood.

The first article on the therapeutic efficacy of Phototherapy was published in ("Irradiated Blood Transfusion in the Treatment of Infections", Northwest Medicine), June of 1934. Written by Hancock and Knott, it described many of their own cases. Though **the article revealed the incredible power of Ultraviolet light in the Cure of Various Infections.** The work of Hancock and Knott took ultraviolet therapy a giant step forward. **They had demonstrated that Ultraviolet Light could be used Effectively in the Treatment of Bloodstream Infections.**

> ***"The Toxins in the Bloodstream, Exposed to Ultraviolet Irradiation Are Inactivated. Clinical experiments have further determined that the beneficial energy is stored up in the rayed blood temporarily, and if such blood can be returned to the bloodstream immediately after it has been irradiated, it will throw off secondary irradiation which will stimulate and energize the patient."***

By June of 1942, 6,520 patients had been treated with Ultraviolet Therapy. Not only had the treatment worked nearly every time, it had done so in the complete absence of any harmful effects.

Contraindications

Dr George Miley did note in 1942 that the **Sulfa Drugs could not be given safely within the first 5 days following Ultraviolet Blood Irradiation Therapy without risking a severe Toxemia, Pulmonary Edema (excessive serous fluid in the lungs) and renal (kidney) shutdown.** He also noted that **those patients who have photo-oxidation therapy have a much shorter convalescent period than those who receive both sulfa drugs and photo-oxidation therapy.** The situation was quite confusing; **because some patients with Staphylococcus septicemia survived, and had no more stormy course than those with other infections, but others promptly died.** Virgil K. Hancock reported on 2 cases of Staphylococcus septicemia, which is generally fatal, who recovered promptly with hemo-irradiation (Rebbeck, "American Journal of Surgery", December 1942).

There are 4 basic Biochemical & Physiological Effects of Ultraviolet Light Therapy:

1. **Bactericidal Activity.**
2. **Detoxification.**
3. **Vasodilatation.**
4. **Increased Blood Oxygen Values.**

These effects are well-known, and have been adequately reported.

It seems unlikely (Miley remarked), that any of these 4 Effects of Ultraviolet could alone, or combined completely account for the remarkable results seen in the treatment Ofthrombophlebitis (inflammation in a vein, blood clots form, and block one or more veins, often in the legs).

Treatment of Thrombophlebitis

It seems that one or more physiological, neurological, or biochemical effects that are not understood must be taking place to account for the; **Profound And Rapid Change Seen in the Treatment of Acute Thrombophlebitis with Ultraviolet Irradiation.**

It is interesting to note that: **Ultraviolet Blood Irradiation does not cause an increase in the tone of intestinal muscle in a normal person; there are no abdominal cramps,** or other indications of a change in the physiological status of normal intestinal musculature.

Yet, **when Photoluminescence is given to a patient with an obviously disturbed autonomic nervous system, involving smooth muscle tone of the gastrointestinal tract, this part of the autonomic nervous system, hopelessly out of balance, comes very quickly back to normal.**

This return to normal muscular tone obviously occurs in the Treatment of Thrombophlebitis, just as it does in a gastrointestinal smooth muscle disease.

Somehow, the smooth muscle elements of that portion of the peripheral vascular system that are diseased are directly affected by the energized light; the rest of the system is not. In view of the fact that the photon energy attacks only the localized peripheral autonomic vascular imbalance, it would appear the body sets up some sort of temporary omni range, that brings the necessary photonic energy to bear on the specific area where it is needed.

There is a marked, generalized peripheral vasodilatation (a pinkening of the skin) with, as Miley says: "almost monotonous frequency" following a blood irradiation. However, in the diseased blood vessels and the musculature of the intestine, the effect is exactly opposite.

The effect there is a vasoconstriction - a constricting of the veins.

Miley summarised this mysterious action as follows:

> *"It is interesting to observe that the grossly discernable vasodilatation effects noticed following application of ultraviolet blood irradiation therapy occur in apparently normal humans, as well as in those who are suffering from various disease processes, whereas an increase in tone of normal gastrointestinal smooth muscle is not apparent, at least not to the extent that it produces colicky or cramp-like contractions. Likewise, as just stated, no evidence of an increase in smooth muscle tone, as in acute thrombophlebitis with edema, appears in normal individuals following blood irradiation but, on the contrary, only vasodilatation occurs.* ***Therefore, it must be assumed that there exists a profound and fundamental regulating effect of the radiated blood upon the autonomic nervous system; this effect could be described as a "normalising effect", and it becomes most apparent in definite imbalances of the autonomic nervous system."***

It is as though the photon-activated blood has a life of its own, and knows where to go (homing in on diseased veins for instance; and what to do), increasing the tone of the diseased vessels; whereas there is a generalised vasodilatation in the rest of the body.

Treatment of Bronchial Asthma

Dr George P. Miley, et al, of Philadelphia, Pennsylvania, studied 80 persons suffering from **Severe Intractable Bronchial Asthma.** It is important to note that these patients were Intractable, meaning no therapy was helping to any material extent. This study was conducted from 1 November 1938 to 1 October 1942.

"Intractable", in these cases was defined as:

1. Failure to respond to removal of known aggravating extrinsic factors such as dust, pollens, foods, etc.
2. Unresponsiveness to all desensitization efforts.
3. Unresponsiveness to bronchoscopy and bronchoscopic drainage.
4. Failure to respond to sinus infection therapy.
5. Temporary or no relief following inhalation or injection of epinephrine (an adrenal hormone) or epinephrine-like preparations.

The Ultraviolet Blood Irradiation Treatments, were administered every 4 to 6 weeks until the patients Symptoms Had Improved. After a few months, the frequency was reduced to a treatment every 8 to 10 weeks. Injections of epinephrine, and other medications were withheld as much as possible. **In most cases, they were gradually and then completely eliminated.**

Clinical Observations on Asthma Therapy

1. **During the first night after the initial blood irradiation, a moderately severe asthmatic attack is likely to occur, especially in patients with severe asthma.**
2. **Marked relief in the frequency and severity of the dyspnea attacks is noted after the second, or third blood irradiation,** given at intervals of 3 to 6 weeks after the initial treatment.
3. During the first year, it is advisable to administer ultraviolet blood irradiation therapy 8 to 12 times at 3 to 6 week intervals.
4. **After the 1st year, the repetition of blood irradiation 2 to 5 times yearly will usually keep a severely affected patient free from asthmatic attacks.**
5. **A cyanosis of many years standing slowly disappears within a year of initiation of Photoluminescence.**

6. A marked and relatively permanent increase in the patient's general resistance occurs, so much so that many patients who have been under constant treatment will be enabled to lead normal, useful lives again with little or no discomfort.

7. A 6 month withdrawal of ultraviolet blood irradiation therapy after 1 or 2 years will occasionally cause a moderately severe exacerbation of the asthma. After irradiation is repeated, the symptoms again subside, though in some cases more slowly than originally.

8. Use of ephedrine or epinephrine inhalants is required only rarely for most patients.

9. There is a complete absence of any toxic effects from the treatment in all patients.

> *"If a patient has had Intractable Bronchial Asthma for 38 years, plus insomnia for 6 years despite of Medical Trade Care, and h**as little or No Asthma, plus Freedom from Insomnia, for almost 4 years from the time she first is given Ultraviolet Blood Irradiation Therapy,** she obviously has had much more than psychotherapy. If the same patient has had, unknown to her, a withdrawal of the therapy by closing off the hemo-irradiator, cutting off the source of Ultraviolet Rays from the returning blood, and begins to show signs of severe asthma again, **she is suffering from a true Ultraviolet Deprivation. If we next really give the patient Ultraviolet Blood Irradiation Therapy, and her symptoms once more clear up, this is proof positive that such a patient not only has been benefitted by the Ultraviolet Irradiation of Blood,** but **has been suffering for years from severe Ultraviolet Deprivation, which apparently plays a much greater part in this disease, as well as others, than has been suspected."** - Dr Miley, MD in "Archives of Physical Therapy", September 1943.*

50 years have passed since Miley attacked the foundations of modem medicine with Photo-Therapy. There is now a scientific explanation for the use of Photo-Irradiation in Allergy. **All Toxic Substances in the body Have a Fluorescence, including chemicals, sick cells (cancer), and allergens (weeds, strawberries, or whatever you are allergic to). This fluorescence is, in effect, a marker which light energy targets for destruction. So when light energy (photons) are introduced directly into the blood, as in photo-oxidation, the recovery is often dramatic.**

Treatment of Polio

George Miley and Jens Christensen reported on 58 cases of Polio. Their results were truly amazing in that, in all the cases treated, they only lost one bulbar case. Bulbar polio (polio of the brain) is 40% fatal. The case they lost was near death when seen and was not expected to live. **The other 6 patients with bulbar-spinal polio, also near death when treated, survived.**

"Dr G.J.P. Barger, MD, (Washington, DC): In my experience in giving over 2,500 Ultraviolet Blood Irradiation Treatments, I am glad to be able to **confirm Dr Miley's conservative statements in regard to the efficacy of Ultraviolet Blood Irradiation Therapy in the Treatment of atypical or "virus" Pneumonia, of which I have treated 15 cases, and in the Treatment of Poliomyelitis of the Bulbar type, of which I have treated 23 cases in 3 years, and 6 cases of Spinal Polio.**

In Encephalitis, I have had 3 early cases in children treated by Ultraviolet Blood Irradiation, with Surprisingly Good Results, which seem to be standing the test of time. I have compared my 11 bulbar Polio cases treated in Washington in 1944, by this method, with the series treated by Dr Miley in 1943 in Los Angeles, and find a very close correlation in the results. While the matter of saving life is important, that of a **prompt inactivation of damaging toxins is more important in the evaluation of the efficacy of ultra-violet blood irradiation in polio.**

When called to give ultraviolet blood irradiation to polio cases (I make a point of prompt response within 1 or 2 hours), for the diagnosis of bulbar polio is often followed by death within a few hours.

During the night following the use of blood irradiation in this case, the child's physician phoned the girl's father that they did not expect the child to live thru the night. The child's father, in happy gratitude for what actually happened, wrote a story of her recovery.

> *"Today,* ***10 months after her nearly fatal bout with a dreaded childhood disease,*** *it is hard to realise that* ***my 8 year old daughter is almost entirely recovered; walking, skipping rope, vigorous, and looking forward enthusiastically to a normal life."***

This was his introductory statement in a story written for publication in a widely read magazine, but withdrawn at my request.

Of **a boy of 6, with fulminating bulbar polio, his physician wrote: "I personally feel that your treatment saved his life."**

Encephalitis Lethargica (Sleeping Sickness)

My first case of Encephalitis Lethargica Treated by Blood Irradiation was practically normal 2 weeks after a 2nd blood irradiation, and both his physician and the parents report the boy **100% normal,** with no residual behaviour or other effects after 2 years.

My second case of encephalitis lethargica was treated by ultraviolet blood irradiation 9 months ago. This was a 20 months old child. Repeated checks in this interval show it is developing normally as compared with 2 other children in the same family. **Ultraviolet Blood Irradiation, in my analysis of its effects, mobilizes the defensive mechanisms of the body on a very high level, so that these mechanisms work with markedly increased efficiency in performing their normal functions of combatting micro-invaders of body fluids and tissues.**

Dr Miley has excellently stated this idea in different words.

The results of Ultraviolet Blood Irradiation, in the hands of different men have been so consistent, and the results in the treatment of "virus diseases", for which nothing else has been available, so good to those who have had a chance to watch the results closely, that it seems an opportunity should open up for an extensive trial of this therapy not only in all the "virus diseases", **but also in the rickettsial diseases**, which has been equally lacking in effective therapy.

Dr H.M. Eberhard (Philadelphia, Pa.): In my gastrointestinal clinic we frequently refer cases to Dr Miley, and Dr Christensen especially those where there exists a low oxygen carrying power of the red cells. Often these have been as low as 2 volumes per cent when several blood irradiations had increased the carrying power within 2 weeks to a month. **Cases where recourse to Ultraviolet Irradiation Therapy have been helpful are: Erysipelas, "Virus" Pneumonia, Bronchial Asthma (without Emphysema), and general Acute Blood Infections."**

Dr George Miley (New York, N.Y.): Bacterial Endocarditis cannot be favourably influenced at all by blood irradiation, nor can the course of malignant neoplastic disease be appreciably altered, though secondary infection can be controlled but then only temporarily; leukemia is not influenced favourably by blood irradiation in our experience. The amount of ultraviolet given is relatively small, but it is given intra-venously, which is extremely important, in very carefully calibrated doses, so what is supplied in this type of treatment is intravenous ultraviolet light in carefully adjusted doses." - in "Ultraviolet Blood Irradiation Therapy in acute virus and virus-like infections", The Review of Gastroenterology", 15 April 1948.

Treatment of Cancer

Dr Robert C. Olney, MD, was a highly-respected Surgeon whose articles had been published in the American Journal of Surgery (3 occasions), and the Journal of the International College of Surgeons.

When Olney began to publish his results on **Photoluminescent Treatment of Cancer** in the mid-1960's, he felt certain he would be rejected, so he resorted to publishing a small pamphlet to describe his remarkable cures.

Olney was an avid follower of the works of William F. Koch and Otto Warberg, both of whom claimed that a blocking, or impairment, of oxidation enzymes in cells allows fermentation of sugar, and that this fermentation in cells is the prime cause of cancer.

Olney said that "blocked oxidation" in organisms causes them to become pathogenic (disease-causing), and that this pathological condition is corrected by proper oxygenation; thus, the organisms again become non-pathogenic and, consequently, non-virulent.

Olney stated:

> ***"With our present knowledge, it should be possible to prevent and wipe out cancer and serious infectious diseases."*** *- Dr Robert C Olney, MD, in "Pamphlet", he founded his own hospital, in Lincoln Nebraska, 1950's.*

That's a bold statement, but **Olney backed it up by proving cancer could be completely eliminated with the use of Photoluminescence; which he called Ultraviolet Blood Irradiation.**

The Full Pamphlet Dr Olney said:

"This presentation deals with the prevention and treatment of "blocked oxidation" which we consider the prime cause of malignant, "viral", bacterial, and allergic diseases. **With our present knowledge it should be possible to prevent and wipe out cancer and serious infectious diseases. We are in an era of destructive therapy, powerful poisonous insecticides, fluoride poisoning and "embalmed foods."** This is an era of ignoring the principles of healthful living and then attempting to cure everything by taking an array of pills. **Blocking of, or injury to the vital oxidation process (respiration) of the living cells by oxygen deficiency or various toxic substances, we find to be the most important cause of malignant, viral, bacterial, and allergic diseases.**

Effective prevention and treatment of these diseases depends upon the restoration and maintenance of the normal oxidation. In malignant disease, when the oxidation process is blocked, energy is produced by fermentation, and micro-organisms grow profusely in this condition.

For many years Dr William F. Koch, and Otto Warburg have claimed that blocking of, or **impairment of oxidation in the enzymes and cells allows fermentation of sugar and that fermentation in these enzymes and cells is the Prime Cause of Cancer.**

Koch has also proved that blocked oxidation in micro-organisms causes them to be pathogenic, and that when this condition is corrected these organisms become non-pathogenic, non-parasitic, and non-virulent.

In so many of these conditions patients have a low blood oxygen level. Some are only 50% to 60% of normal, as shown in this paper. As part of this paper are the results of studies made in 1968 which confirm studies by Dr George Miley, MD.

Our Clinical Studies show that intravenous Ultraviolet effectively increases the Blood Oxygen to normal, or near normal in most cases.

In The Treatment The Following Are Very Important:

1. Intravenous Ultraviolet rapidly increases the Oxygen Absorption of the patient bringing the blood oxygen up to normal. The powerful oxidation catalyst stimulates the use of this increased Oxygen or the patient's oxygen at any level to restore the normal cell respiration.

2. The Diet of these patients is extremely important, using foods grown with natural fertilizers and without poisonous fertilizers and insecticides, and eating much of it raw. Since so many patients are deficient in important trace minerals such as magnesium and zinc, it is important to see that these patients are supplied with sufficient trace minerals in chelated form so that they are readily absorbed.

3. Since much of the toxic substances producing these diseases comes from the colon we use Colonic Irrigations.

Treatment of Blocked Oxidation
Case Reports

Case 1

17 January 1969, Miss D.P., 38 years old, was admitted. Past History: 11 years ago a melanoma was removed from the right upper arm. August 1968 subcutaneous tumor mass appeared on the upper left chest just below the clavicle.

Excision and biopsy of this revealed malignant melanoma. Following this she developed a tumor on the right chest at the same level, tumor in the right axilla, abdomen began to become very large, patient had marked difficulty in breathing, and constant cough. There was gradual and painful swelling of the right thigh (all at another medical center).

Present Illness: On entering the hospital, was in critical condition with marked difficulty in breathing, constant cough, cyanosis, abdomen very large and pendulous containing a large amount of fluid in which there were large tumor masses palpable throughout, especially the entire lower abdomen and lower tight quadrant.

Extremities: The right thigh from the knee to the hip was very swollen and painful, about twice normal size.

Diagnosis: **Generalized Malignant Melanoma.**

Treatment: Patient was immediately given Ultraviolet Blood Irradiation (UBI) to overcome hypoxemia, the oxidation catalyst (Koch Glyoxylide) intermuscularly, ultra mycro-wave therapy throughout the body, diet consisting of raw vegetables and fruits eliminating all meats and fluorides, Colonic Irrigations to remove the toxic material from the colon, and large doses of trace minerals especially magnesium and zinc with natural Vitamin C, and natural Vitamin E, in addition to other natural vitamin supplements.

UBI treatments given on 17, 20, 24 January, and once a week following this. Koch Glyoxylide given on 17 January, 20 February, 21 March, 2 June, and 17 July.

Mycro-wave given on 17, 27 of January, and 3, 6, 12, 19, 26 of February, and once a week following this. Within three weeks the mass in the right axilla had disappeared as well as the tumor of the right chest wall, and the abdomen was becoming definitely smaller and the tumor masses much smaller.

At the end of 6 weeks of this treatment, patient had no difficulty in breathing, the right thigh was normal size and no pain the abdomen had returned to normal size with no fluid, and the tumor masses were practically gone with only very small evidence of tumor in the lower abdomen. Patient up and about in a normal manner except for some weakness following her long illness.

This patient will remain under treatment in the hospital for another 2 or 3 weeks when she will be discharged to go to her home in Utah with instructions to return in approximately 3 months for examination and further treatment for the prevention of further development of malignant melonoma.

This type of case will need observation over a period of several years to be sure as possible of success. This case illustrates the very early effective results of treatment of the whole program that we are now using for the treatment of all malignancy. This treatment is based upon the evidence (Burk, Dean, National Cancer Institute, "The Prime cause and prevention of Cancer", Konrad Trietsch, Wurzburg, Germany, 1967), that cancer is due to hypoxemia and blocking of oxidation with the development of fermentation of sugars which causes the cancerous growth. **It has been shown that all cancers have one common factor, and that is, fermentation of sugar in the enzymes and cells, replacing normal oxidation. Reversal of this process back to normal oxidation is all important.**

Case 2

Mrs. A.F., age 64, entered hospital on 21 April 1953 with a rapidly developing carcinoma of the left breast. A few years before this she had had cancer of the right breast with a radical mastectomy followed by x-ray therapy. On this occasion mastectomy with removal of axillary lymph glands was performed, but not a radical mastectomy. It was found that the cancer was penetrating the chest wall and into the lung. Post-operative therapy consisted of x-ray therapy, but principally the program of stimulating the Oxygen content and the use of minerals, particularly magnesium and zinc. At first the UBI treatments were given at weekly intervals and after 3 months they were given at monthly intervals and this continued on for 5 years. She continued to take the zinc and magnesium supplement and other general vitamin supplements. **Within a few months there was no evidence of malignancy in the x-ray of the lung.** This patient is now living and well and has had no evidence of recurrence of her malignancy.

Case 3

Mrs. A.R., age 60, entered the hospital 22 June 1960 with a large tender mass in the left abdomen which was thought to be a perinephritic abscess.

Upon operation it was found that patient had a large carcinoma of the splenic flexure of the colon which had ruptured into the abdominal cavity. There were melostatic nodules beyond the primary growth. A Miculitz type operation was performed and in due time closed. Following surgery patient was placed on an intensive program of ultraviolet blood irradiation, given 4 in the first week, and 1 each week thereafter for several months. She was also given zinc and magnesium in adequate amounts with other vitamin and supplements. **Patient made a very excellent recovery from the surgery and is living today.** She kept up with the Blood Irradiation Treatment once a month for 5 years, and also the supplement therapy.

Case 4

Mrs. C.B., age 55, entered the hospital on 4 January 1954 with a nodular tumor of the thyroid. At operation it was determined she had an adeno-carcinoma and sub-total thyroidectomy was performed leaving very little thyroid tissue.

Following her surgery she was given UBI treatments, four in the first week and one each week, following this together with adequate magnesium and zinc therapy. This treatment was continued once a month for 5 years. **Patient is still living and well and has had no recurrence of her carcinoma.**

Case 5

On 30 April 1969 Mrs. I.W., 50 years of age entered Providence Hospital for treatment of a large tumor of the uterus considered to be carcinoma.

Past History: February 1968 patient found to have cancer of the cervix and uterus and was given radium and cobalt treatments for a month. In August 1968 she was examined again and her doctor told her that she had a large cancer of the cervix and uterus and that nothing could be done and told her to "just go home and die." Following this she had 6 months of laetril treatment. (All of this was at other treatment centers – not here.)

On entering Providence Hospital, examination revealed a large tumor of the uterus and pelvis, specifically carcinoma. She was given **Ultraviolet Blood Irradiation** on 1, 2, 6, 14 May and once a week following this.

She was given Koch Glyoxylide on1, 6, 26 May, 6, 16 June, she was given mycro-wave treatments on 1, 6, 14, 19, 29 May, 4, 9 and 30 June. Along with this she was given the **Diet of Raw Vegetables, and Raw Fruits**, together with adequate amount of **Zinc, Magnesium, Vitamin C, Vitamin E, Vitamin B6.**

By 24 June examination revealed a marked reduction in the size of the tumor with only slight discharge from it and it was felt that it was possible to remove the tumor surgically. Hysterectomy was performed on 26 June 1969, by Dr Richard C. Olney, MD, and the entire uterus including the cervix removed and the remaining right falopian tube. **Pathological examination of the specimen removed failed to reveal any viable cancer tissue in the cervix or uterus.**

Patient has made an uneventful recovery from surgery, and is continuing on with a vigorous program of treatment to assure as much as possible no recurrence of her malignancy.

Blood Oxygen Saturation After Intravenous Ultraviolet (Ultraviolet Blood Irradiation)

Hypoxemia is a common and serious factor in so many diseases, and surgical procedures.

Correction of this and bringing the oxygen saturation of these patients to normal or near normal is vitally important in the treatment of these diseases, and the success of serious surgical procedures.

This report deals only with the blood oxygen saturation changes following Intravenous Ultraviolet Therapy (UBI).

(Ultraviolet Blood Irradiation is by use of the Knott Hemo-Irradiator.

A definite amount of patient's blood, 1 1/2 cc per pound of body weight is withdrawn from a vein, citrated and returned immediately to patient after passing through the Knott-Hemo Irradiator and thus exposed to a certain band of ultraviolet light in an exact period of time, 10 cc in 20 seconds.)

For this study 23 patients were selected at random regardless of the diagnosis in which there was clinical evidence of hypoxemia.

Patients were selected in which there was no known condition which would interfere with or change the outcome of these studies. Before the first treatment of intravenous ultraviolet 5 cc of venous blood was removed and immediately taken to the American Optical Oximeter and the oxygen saturation was determined prior to the treatment. In this way the Oxygen saturation was compared with the day previously, and the previous determinations, for the changes which could take place following the Intravenous Ultraviolet Therapy. Normal Oxygen saturation on the American Optical Oximeter is 100% for arterial, and 72% for venous blood.

The following is a brief review of the cases in this study:

1. Mr. L.H. Middle-aged man with Lymphatic Leukemia, Venous oxygen 48%, 24 hours after 1 UBI 65%.
2. Mr. C.G. Metastatic Carcinoma of the lung, Venous oxygen 54%, 24 hours after 1 UBI 66.5%.
3. Mrs. E.H. Hysterectomy for uterine fibroid, Venous oxygen 54.7%, 24 hours after 1 UBI 75%.
4. Miss D.W. Laboratory technician. Apparent good health, but heavy smoker, Venous oxygen 50%, 24 hours after 1 UBI 64%, 24 hours after 2nd UBI 81%.
5. Mr. V.B. Acute severe respiratory infection. Venous oxygen 48%, 24 hours after 1 UBI 65%, 24 hours after 2nd UBI 81%.
6. Mr. C.T. Severe diabetic with cerebral vascular accident, Venous oxygen 48.8%, 24 hours after 1 UBI 84%.

7. Mrs. B.S. Acute Mastoiditis and upper respiratory infection, Venous oxygen 47%, 24 hours after 1 UBI 71%

8. Mrs. H.M. Acute congestive heart failure. Venous oxygen 32%, 24 hours after 1 UBI 56%, 24 hours after 2nd UBI 70%.

9. Mr. E.D. Asthma with acute myocarditis. Venous oxygen 48%, 24 hours after 1 UBI 58%, 24 hours after 2nd UBI 68%.

10. Mr. A.V. Extensive malignancy of the ear and side of the head. Venous oxygen 52%, 24 hours after 1 UBI 60%, 24 hours after 2nd UBI 66%.

11. Mr. P.Z. Severe Diverticulosis of the colon, myocarditis and acute respiratory infection. Venous oxygen 53% 24 hours after 1 UBI 60%, 24 hours after 2nd UBI 66%.

12. Mr. C.C. Patient in critical condition with intestinal obstruction. Acute respiratory infection, Venous oxygen 50%, 24 hours after 1 UBI 63%.

13. Mr. R.D. Complete acute occlusion of the femoral artery at the femoral region with impending gangrene of the leg. Venous oxygen 38%, 24 hours after 1 UBI 73%.

14. Miss A.W. Operated on for cholecystectomy and appendectomy. Venous oxygen 42% 24 hours after 1 UBI 84%.

15. Miss N.S. Coronary insufficiency. Respiratory infection, Venous oxygen 53%, 24 hours after 1 UBI 60%, 24 hours after 2nd UBI 68%.

16. Mr. W.H. Acute cerebral vascular accident with severe acute otitis media and mastoiditis, Venous oxygen 40% 24 hours after 1 UBI 56%, 24 hours after 2nd UBI 66%.

17. Mr. A.C. Myocarditis, Acute respiratory infection, Carcinoma of the prostate, Venous oxygen 34%, 24 hours after 1 UBI 48%, 24 hours after 2nd UBI 60%

18. Mr. R. Stricture of the lower esophagus with almost complete closure of the esophagus and marked dilation, Venous oxygen 32%, 24 hours after 1 UBI 42%, 24 hours after 2nd UBI 57%

19. Mr. B.S. Pericarditis, Cholecystitis and Pyelonephritis, Venous oxygen 47%, 24 hours after 1 UBI 71% 24 hours after 2nd UBI 86%.

20. Mrs. F.B. Severe neurosis, Venous oxygen 29% 24 hours after 1 UBI 83%, 24 hours after 2nd UBI 86%.

21. Mrs. R.B. Thrombophlebitis and Cholecystitis, Venous oxygen 18% 24 hours after 1 UBI 62%.

22. Mrs. P. General carcinomatosis of pelvis from CA of uterus and heavy cobalt treatments, Venous oxygen 43%, 24 hours after 1 UBI 65%, 24 hours after 2nd UBI 80%.

It is important to emphasize that in so many pathological conditions there is a very marked hypoxemia, and that this is a very important factor in the diseased condition. It is important, that the Blood Oxygen saturation is returned to normal as rapidly as possible, in the treatment of these patients or in the performing of extensive surgical procedures, as a matter of giving these patients one of the most important factors in their defense mechanism and resistance.

Summary

Hypoxemia and blocked oxidation followed by fermentation of sugar in the enzymes, and cells we consider to be the prime factor in malignant, viral, bacterial and allergic diseases. A program of prevention and treatment of this condition is presented which has proved in the past, and is proving at this time to be very effective, in correcting the pathological physiology which has taken place and returning normal oxidation to the enzymes and cells for the recovery of these patients." - Robert C. Olney, MD, in "Pamphlet", 1968.

This Studies; 40 years would still be totally ignored by the Medical Trade.

Following the work of Koch and Warberg, Olney did many studies on blood oxygen levels, and proved (again) that **oxygen levels in the blood are always low in ill people. Miley had also done studies on oxygen absorption with the use of ultraviolet irradiation of blood in 1939 (American Journal of Medical Science, 1939). Olney showed, in every case measured, that blood oxygen levels are drastically reduced in sick individuals. He tested everything from heavy smokers to respiratory infection to terminal cancer, and, without exception, the venous blood oxygen levels were depressed before treatment with photoluminescence and increased after treatment. This effect of ultraviolet light on blood has been known since 1925** (Harris, Biochemical Society meeting, South Kensington, England, 7 December 1925). **The vast array of diseased conditions in which blood oxygen levels are depressed. The venous blood oxygen levels before and after treatment with photoluminescence are given.**

Doctors Koch and Warberg firmly established that Oxygen Deficiency blocks the basic physiological oxidation processes in the body.

This makes the body produce required energy through fermentation instead of oxidation. **Koch and Warberg, agree that this is the pathological basis for malignant, infectious diseases.** For instance, **hardening of the arteries (Atherosclerosis) is not caused by Dietary Cholesterol but by Oxygen Deprivation. The theory states that pathogenic organisms become nonpathogenic after oxidation is re-established in them. The remarkable effectiveness of photoluminescence** would seem to confirm these ideas. **What better confirmation than seeing the process work in elimination of disease as the blood oxygen level rises?** In his Monograph, Dr Olney Reported **5 Cases of Cancer, out of which he had 5 recoveries using Ultraviolet Blood Irradiation (**100% is not a bad recovery rate for a disease that is incurable by all "modern" methods).

Case 1

"Mr D. P., a 30-year-old, was admitted to the hospital with a diagnosis of generalized malignant melanoma (a virulent form of skin cancer).

11 years previously, a malignant melanoma had been removed from his right upper arm.

When admitted to the hospital by Dr Olney he had a tumor mass under the skin at the upper left chest just below the clavicle (collar bone).

Excision and biopsy revealed that the malignant melanoma had returned.

He quickly developed metastases (tumor spread) all over his body and his abdomen became very large from tumor growth. He had difficulty in breathing, had a constant cough and was obviously in serious condition. He was blue in the face and cancer could be felt throughout his abdomen. The patient was given ultraviolet blood irradiation therapy immediately and approximately every 3 days for about 1 week and then weekly. Within 3 weeks, the large tumor mass in his right armpit disappeared as well as a tumor on the right chest wall; the abdomen became definitely smaller and the tumor masses much less palpable. At the end of 6 weeks of treatment the patient had no difficulty in breathing; his right leg, which had been extremely swollen, was normal and free of pain; and the abdomen had returned to normal size with no fluid or tumor masses palpable. Olney remarked about this patient: This case illustrates the very early, effective results of treatment with the whole program that we are now using for the treatment of all malignancy.

This treatment is based upon the evidence that cancer is due to hypoxemia (low blood oxygen concentration) and blocking of oxidation with the development of fermentation of sugars which causes the cancer's growth. It has been shown that all cancers have one common factor and that is fermentation of sugar in the enzymes and cells replacing normal oxidation. Reversal of this process back to normaloxidation is all-important.

Case 2

Miss A.F.A., a 64-year-old, entered the hospital on 21 April 1953, with a rapidly-developing carcinoma of the left breast. A few years prior, she had cancer of the right breast with a radical mastectomy followed by x-ray therapy. On this second occasion a mastectomy was performed with the removal of lymph nodes in the armpit. It was found that the cancer had penetrated the chest wall into the lung. Ultraviolet blood irradiation treatments were given at weekly intervals and, after 3 months, were given at monthly intervals and continued for 5 years. “Within a few months there was no evidence of malignancy on x-ray and the patient is now living and well and has had no recurrence of her malignancy”, Olney reported.

Case 3

Mrs. A.R., a 60-year-old white female, entered the hospital on 22 June 1960, with a large mass in the left abdomen which was thought to be an abscess around the kidney. Upon operation it was found that the patient had a large carcinoma of the colon which had ruptured into the abdominal cavity. There were metastatic nodules beyond the primary growth - a serious and terminal cancerous condition. Following surgery the patient was placed on an intensive program of ultraviolet blood irradiation. She was given 4 treatments the 1st week, and 1 each week thereafter for several months.

The patient made an excellent recovery and kept up with the blood irradiation treatments, once a month for 5 years.

Case 4

Mrs. C.B., a 55-year-old, entered the hospital with a diagnosis of tumor of the thyroid gland. During an operation it was determined that she had an adenocarcinoma, so a sub-total thyroidectomy was performed. Following her surgery she was given photo-oxidation treatments, 4 in the first week, and 1 each week following. The treatment was continued once a month for 5 years. She remained well and had no recurrence of her cancer.

Case 5

On 30 April 1969, Mrs. I.W., a 50-year-old, entered the hospital for treatment with a large tumor of the uterus that proved to be cancer. The previous year the patient had been found to have cancer of the cervix and uterus and was given radium and cobalt treatments for 1 month. 6 months later she was re-examined.

Her doctor told her that she had a large cancer of the uterus and that nothing could be done. He told her to "just go home and die."

When examined by Dr Olney she had a large tumor of the uterus and pelvis.

She was given Photo-Oxidation Therapy, 4 treatments the 1st week, and then 1 a week.

A month later, examination revealed a marked reduction in the size of her tumor and it was felt that she was now well enough to have the tumor removed surgically Ahysterectomy was performed. A pathological examination of the specimen failed to reveal any viable cancer tissue in the cervix or the uterus.

The patient made an uneventful recovery and did well with no recurrence of her malignancy. In my own practice, I have also given several cancer patients Photoluminescent treatment. Like Dr Olney, I have found it to be far superior to any other cancer treatment available. However, my treatment has been limited in efficacy by the wavelength of light which I have been using.

I have been employing Ultraviolet-C, while Dr Olney used Ultraviolet-A.

Ultraviolet-C is not the best frequency for treatment of cancer, though, as you will see, it does produce some beneficial results. At the present time, a new blood irradiation device is being engineered that will use the proper wavelength of light for cancer treatment. The use of such a device will greatly improve the prospects of cancer survival.

The Important Thing Is Blood Oxygen

The work of Koch, Warberg and Olney proves beyond a doubt that in most, if not all, pathological conditions there is a marked Hypoxemia (Oxygen lack).

This is an extremely important factor in correcting any disease state.

The important thing is that Blood Oxygen saturation must be returned to normal, or above normal, as rapidly as possible if the patient is to be cured.

Hypoxemia or, as Olney called it, "blocked oxidation", followed by fermentation of sugar in cells, is the prime factor in malignant, virulance, bacterial, and allergic diseases. We believe, from the reports of the pioneers in ultraviolet irradiation therapy and bio-oxidative therapy, plus our experience, that photo-oxidation will become the treatment of choice for all Disease-Oxygenation is the key. **The process will be the major factor, in slowing the aging process."** - Dr William C. Douglass, MD, in "Into the Light: Tomorrow's Medicine Today", 1997.

Ultraviolet Deprivation

> *"**Ultraviolet Deprivation** must be considered as a possible adverse factor for cosmonauts on long-term flights. For this reason, the author reviews the literature pertaining to the biological effects of ultraviolet radiation. **Effects reviewed with consideration of the influence of wavelength and dosage include: Erythema, Bacteriocidal, Antirachitic, Facilitation of nonspecific immunity and resorption of inflammations, Acceleration of Histamine Production, Facilitation of Healing of infected muscles, and Damage to the Eyes."** - in "NASA Contractor Report 3922(07)", USSR Space Life Sciences Digest, Issue 6, June 1986.*

Chapter 8

The Importance of Hyperbaric Oxygen Therapy

Full Brain Regeneration by Hyperbaric Oxygen Therapy

In 2016, a 2 year old girl drowned in a pool at her home.

The girl was submerged between 5 to 15 minutes, her mother started CPR, in 10 minutes the Paramedics arrived, the girl organs where not working, and was dead on arrival at the hospital. After 100 minutes of continuous CPR, the girl was miraculously revived, but brain dead.

Medical Trade Doctors told her parents, that if she survives the next 48 hours, she would permanently be left in a vegetative state, with no brain activity, and no medical treatment available. Her parents immediately start to research an alternative, their research led them to Hyperbaric Oxygen Therapy (HBOT), which enhances the body's natural healing process by inhalation of 100% oxygen. Just after 40 Hyperbaric Oxygen Therapy (HBOT) sessions, the girl went from a vegetative state to being able to pulling herself to stand and taking some steps, all her speech returned, she became the first person (properly recorded) to regrow brain tissue, with her brain MRI as normal.

> ***"The little girl, whose Heart Didn't Beat on her own for 2 hours after drowning, showed Deep Grey Matter Injury, and Cerebral Atrophy with grey and white matter loss after the incident, and Could No Longer Speak, Walk, or Respond to voices. She was in the water for 15 Minutes before being discovered, and had experienced Cardiac Arrest, and while her mother immediately began CPR, Eden Wasn't successfully Resuscitated for 2 Hours, being eventually revived. Amazingly, Thanks to a Course of Oxygen Treatments – including Hyperbaric Oxygen Therapy (HBOT), Were Able to significantly Reverse the Brain Damage."*** *- in "Scientists Have Reversed Brain Damage in a 2-Year-Old Girl Who Drowned in a Swimming Pool", Science Alert, 19 July 2017.*

Blood Circulation is one of the most important functions of the body.

Without the Circulatory System, the Brain, Heart, and all other vital organs couldn't receive the Oxygen they need to function properly and survive.

Good Circulation keeps the Brain sharp, the Heart strong, and give complexion to the body.

The Brain, and the Heart aren't the only organs affected by Poor Circulation, a lack of Blood flow can affect any part of the body.

Hyperbaric Oxygen Therapy

Delays and Reverses the Ageing Process

“Recent research **“Cognitive Enhancement of Healthy older adults using Hyperbaric Oxygen”**, Aging, 15 July 2020, **found that when healthy adults over the age of 64 were placed in a pressurized chamber, and given pure Oxygen for 90 minutes a day, 5 days a week for 3 months, not only was the Ageing Process Delayed - It Was Actually Reversed.**

> ***“The Oxygen fluctuation we generated is what is important. We are not just slowing the decline, we are going backwards in time.”*** *- Prof. Shai Efrati, Tel Aviv University*

Some 35 adults over the age of 64 were involved in the study, and were administered Hyperbaric Oxygen Therapy (HBOT) utilising 100% Oxygen.

Repeated intermittent hyperoxic (increased Oxygen level), exposures induced many of the mediators and cellular mechanisms that are usually induced during hypoxia (decreased Oxygen levels); called the hyperoxic-hypoxic paradox.” - in “The Jerusalem Post”, 21 November 2020.

The Usefulness of Oxygen Therapy For Health and in Healing

“Hyperbaric Oxygen Therapy (HBOT); encourages the body's oxygen radical scavengers to seek out the problem molecules and let healing continue.

HBOT helps block the action of harmful bacteria and strengthens the body's immune system.

Hyperbaric Oxygen Therapy, is Used to Speed Up Healing of:

1. **Carbon Monoxide Poisoning.**
2. **Cyanide Poisoning.**
3. **Crush Injuries.**
4. **Gas Gangrene (a form of Gangrene in which gas collects in tissues).**
5. **Decompression Sickness.**
6. **Acute or Traumatic Reduced Blood Flow in the Arteries.**
7. **Compromised skin grafts and flaps.**
8. **Infection in a Bone (Osteomyelitis) that doesn't respond to other treatment.**
9. **Delayed Radiation Injury.**
10. **Flesh-eating Disease (Necrotizing Soft Tissue Infection).**
11. **Air or Gas Bubble Trapped in a Blood Vessel (Air or Gas Embolism).**
12. **Chronic infection called Actinomycosis.**
13. **Diabetic wounds that are not healing correctly.**
14. **Wounds that won't heal.**

It is Also Used for Infections in which Tissues Are Starved for Oxygen.

The goal of Hyperbaric Oxygen Therapy is to Fill the Blood with enough Oxygen To Repair Tissues, and Restore Normal Body Function.

With HBOT the Blood Carries the extra Oxygen Throughout the Body.

This Infuses the Injured Tissues that Need More Oxygen So They Can Start Healing.

HBOT: Helps Block the Action of Harmful Bacteria, and Strengthens the Body's Immune System.

HBOT: Can Disable the Toxins of Certain Bacteria.

It also increases Oxygen concentration in the tissues.

This helps them Resist Infection, and Improves the ability of white blood cells to find and destroy invaders.

HBOT: Encourages the Formation of New Collagen, and New Skin Cells.

It does so by encouraging new blood vessels to grow.

It also stimulates cells to make certain substances, like vascular endothelial growth factor.

These Attract and Stimulate Endothelial Cells Needed for Healing." - in "Hyperbaric Oxygen Therapy", Johns Hopkins University, 13 July 2019.

> ***"It cannot be disputed that cancer could be prevented if the respiration of the body cells would be kept intact. It Is The First Precondition of the Proposed Treatment that All Growing Body Cells be Saturated With Oxygen." - Dr Otto H. Warburg, MD, in "The Prime Cause and Prevention of Cancer",*** *August 1966.*

The Conditions That Oxygen Therapy Helps to Resolve

"Hyperbaric Oxygen Therapy helps treat the following:

1. **The Bends (Decompression Sickness).**
2. **Burns.**
3. **Hearing Loss.**
4. **Injuries that cut or break your skin (wounds).**
5. **Loss of Vision.**
6. **Severe Anemia.**
7. **Severe Bone and Skin Infections.**
8. **Skin Grafts.**
9. **Trauma from force or pressure on a body part (Crush Injury).**

Hyperbaric Oxygen is healthy.

It's pure Oxygen, which helps your immune system Fight Bacteria; and Generate Stem Cells.

Stem cells are special cells in your body that help create other types of important cells, including blood cells, brain cells and muscle cells.

Contraindications

Some People Shouldn't receive Hyperbaric Oxygen Therapy; It May be Dangerous if they have:

1. Collapsed Lung (Pneumothorax).
2. Lung Disease (that may increase your risk of getting a collapsed lung); including Chronic Obstructive Pulmonary Disease, Cystic Fibrosis, and Emphysema.
3. Fever, or Cold.
4. Recent Ear Injury.
5. Recent Ear Surgery.

Room Air contains 21% Oxygen; while Hyperbaric Oxygen Therapy provides you with air that contains 100% Oxygen. A pressurized chamber delivers Oxygen that's 2 to 3 times higher than normal air pressure, which helps your lungs gather and absorb more Oxygen. Oxygen helps the tissues in your body heal, and withstand infections." - in "Hyperbaric Oxygen Therapy", Cleveland Clinic, 1 July 2023.

Conditions Treated with Hyperbaric Oxygen Therapy

"Conditions approved by the U.S. Food and Drug Administration, and the Undersea and Hyperbaric Medicine Society for Hyperbaric Oxygen Therapy:

1. Urinary or Rectal Bleeding, as well as Non-Healing Wounds.
2. Chronic Diabetic Foot Ulcers.
3. Chronic Bone Infections.
4. Aseptic Osteonecrosis (Bone Necrosis tissue due to a lack of blood supply).
5. Skin grafts, or flaps that aren't properly healing.
6. Acute Ischemia (which involves any condition that stops blood flow, such as traumatic wound injuries, crush injuries).
7. Sudden Blindness or partial loss of vision due to central retinal artery occlusion
8. Sudden Hearing Loss.
9. Gas Gangrene.
10. Necrotizing soft-tissue Infection (often from flesh-eating bacteria).
11. Intracranial Abscess.
12. Carbon Monoxide Poisoning
13. Gas Embolisms (where air gets trapped in blood vessels and tissues, such as when scuba divers surface too quickly from deep water)." - in " Hyperbaric healing: The power of precise Oxygen Therapy", University of Texas Southwestern Medical Center, 14 November 2024.

High Levels of Oxygen Benefit Healing

"We have forgotten that the Oxygen we gain from Breathing, not only allows us to Function, It Is The Key To Our Recovery from Injury or Disease.

When we have a Stroke, our Brain is starved of Oxygen, causing the catastrophic death of those Nerve Cells, and leaving us paralysed and unable to speak. Yet within days, the same patients start to regain movement and the ability to speak. This is not a sign of nerves coming back to life, but **the brain rebuilding itself, creating new nerve connections and bypassing the damaged areas.**

Brain imaging has shown that Nerve Cells may become dormant and can be revived after injury, but it depends on sufficient Oxygen being available.

There has been a second important discovery relating to **brain repair; the stem cells that form the brain as we grow in the womb are still present in our brains as adults and they retain the ability to grow new nerve cells.**

The Mistaken Belief that Everything Will Eventually be Cured by a Pill, is a Delusion no longer shared by the executives of Pharmaceutical Companies.

It was reported on the programme "Today", Radio 4, BBC, in February 2011, by Professor David Nutt, and Professor Douglas Kell, that the multinational Drug Companies Pfizer, Glaxo SmithKline, and Astra Zeneca had closed their Neuroscience Divisions. Ironically, they referred to it as "the last nail in the coffin."

> *"The sheer financial scope of* ***failures of neuro-leads in late-stage pipelines has made Central Nervous System (CNS) Drug development a literal brain drain.***
>
> *No wonder Big Pharma seems to be* ***turning its back on CNS drugs.***
>
> ***Since 2011: GSK, AstraZeneca and Novartis have announced closures of Neuroscience Divisions globally. Pfizer, Sanofi, Janssen and Merck have begun to significantly downsize CNS operations.*** *Lilly and Pfizer were not the only Drug developers to be plagued by CNS pipeline disasters. Baxter's Alzheimer's lead Gammagard failed to slow disease progression in Phase III Alzheimer's trials in July 2013.*
>
> ***Biotech Satori Pharma completely shut down operations after a disastrous trial performance of its lead Alzheimer Disease compound SPI-1865 in May 2013."***

The evidence that High Levels of Oxygen Benefit Healing has been published in many thousands of papers over the last hundred years.

The most complex blood vessels in the body are those that supply the brain, because **they form a crucial barrier between blood and the delicate cells of the nervous system.**

Until recently, the blood-brain barrier has had little attention in neurology, although the first question asked in **Pharmaceutical Companies about a new drug is whether it crosses the blood-brain barrier.** We shall see that understanding **the blood-brain barrier is vital to finding effective treatment for several conditions that affect the nervous system, and the barrier is, in fact, damaged in the commonest disease of the brain, and spinal cord, multiple sclerosis.**

When, after damage, the blood-brain barrier does not recover, the escape of Toxic Components from blood into sensitive nerve tissue may cause damage, and in patients with multiple sclerosis, the progression of disability.

The brain has a second circulation involving the colourless liquid known as Cerebrospinal Fluid.

The constituents of Cerebrospinal Fluid are very tightly controlled, ensuring a very constant chemical environment to allow the cells of the brain to function properly. The complexity of the blood-brain barrier defies belief and its relationship to disease.

Contrary to popular belief, the first response of the body to lack of oxygen is not to increase the rate of breathing, it is the pulse rate that increases together with the output of blood by the heart." - in "Oxygen and the Brain: The Journey of Our Lifetime", 2014.

Promoting Formation of New Blood Vessels

Hyperbaric Oxygen Therapy (HBOT) increases delivery of Oxygen to the body, this Improves Circulation by increasing Oxygen levels in the Blood, and Promoting the Formation of New Blood Vessels. It is particularly beneficial for conditions where circulation is compromised, such as: peripheral artery disease, wounds, and other conditions where tissues are not receiving adequate Oxygen.

"Neovascularization is another critical aspect of Hyperbaric Oxygen Therapy.

Angiogenesis depends on the fibroblast's secretory function, which creates a matrix that capillary buds can invade. **An essential component of this process is a gradient of well-oxygenated to near-anoxic tissues.**

Vascular Endothelial Growth Factor (VEGF) is the primary growth factor responsible for **initiating the processes leading to new blood vessel formation.**

VEGF is induced by Oxygen, and increases with higher Oxygen tensions.

Hyperbaric Oxygen Therapy Improves Red Blood Cell (RBC) elasticity, and reduces platelet aggregation. Additionally, the plasma's ability to carry dissolved Oxygen to areas that RBCs cannot reach; contributes to better Oxygenation of hypoxic tissues in various circulatory disorders.

Clinical Applications of Hyperbaric Oxygen Therapy, where vasoconstriction Improves Outcomes, include:

1. **Crush Injuries.**
2. **Gas Gangrene.**
3. **Compartment Syndromes.**
4. **Threatened Flaps and Grafts.**
5. **Burns.**
6. **Decompression Sickness.**
7. **Several off-label uses.**

HBOT-induced angiogenesis has several clinical applications.

Wound Healing Depends on Adequate Blood Flow and Oxygen supply, but certain wounds, such as; diabetic ulcers and radiation-damaged tissues, often have impaired circulation, hindering the healing process.

Hyperbaric Oxygen Therapy; Increases Oxygen access to damaged tissue through plasma saturation, and also stimulates new blood vessel formation by activating transcription factors like Vascular Endothelial Growth Factor.

Additionally, HBOT-induced angiogenesis and fibroplasia have been shown to promote healing in radiated tissue.

Hyperbaric Oxygen Therapy is also a valuable adjunct in treating acute blood loss anemia.

Hyperbaric Oxygen Therapy is also used as an adjunctive treatment for peripheral vascular disease through several mechanisms.

Hyperbaric Oxygen enhances Oxygen Supply to Ischemic [a less-than-normal amount or restriction in blood supply to any tissue, muscle group, or organ of the body, causing a shortage of oxygen that is needed for cellular metabolism]**, or** [when oxygen is insufficient] **Hypoxic Tissues with marginal perfusion and improves cellular metabolism impaired by hypoxia.**

Hyperbaric Oxygen Therapy alleviates ischemic effects by promoting angiogenesis and healing.

HBOT improves cardiovascular outcomes through various mechanisms.

HBOT reduces inflammation by upregulating protective enzymes like superoxide dismutase and catalase.

These enzymes are activated by an increased adaptive antioxidant response, which is driven by a regulated increase in reactive oxygen and nitrogen species.

A recent animal study demonstrated that a short course of Hyperbaric Oxygen Therapy Improves Cardiac Function." - in "Hyperbaric Cardiovascular Effects", StatPearls, 2025.

Electro-Stimulation and Electroceuticals

> ***"There is a strong relationship between the Electrical and Molecular layers of the Brain.***
>
> ***Molecular changes are likely to cause changes in the firing patterns of neurons. Meanwhile, physically exciting or suppressing the electrical activity of neurons results in changes to synaptic neurotransmission of various molecules.***
>
> ***Electric brain stimulation is an up-and-coming practice which offers more precision and less side-effects in the treatment of disorders whose location in the brain we have been able to elucidate."*** *- in "Drug Discovery World", Fall 2013.*

Oxygen Is The Most Vital to the Body

"Of All The Chemical Elements: Oxygen Is The Most Vital to the Human Body.

The Brain Is The Most Sensitive Organ to Oxygen deprivation (hypoxia), which, over an extended period, can cause:

1. **Coma.**
2. **Seizures.**
3. **Cognitive Impairment.**
4. **Neurological Disabilities.**
5. **Brain Death.**

However, during mild hypoxia of short duration, the brain develops adaptative mechanisms that allow it to maintain normal physiological conditions.

Maintenance of normal brain function depends on a continuous supply of Oxygen, so it is crucial for the body to be able to detect and respond rapidly to hypoxia. (Hypoxia is a state of deficiency of available Oxygen in the blood and bodily tissues). It is closely related to anoxia, which is a complete lack of Oxygen in the tissues. Certainly, there is considerable heterogeneity in Oxygen levels within the body (21% O2 in the atmosphere, 14% O2 in the alveolar air, 12% O2 in the arterial blood and 5.3% O2 in venous blood),with a mean of 3% O2 in tissues.

Oxygen sensing is crucial for Cell Survival, and for a living organism's ability to adapt to changing environments or physiological conditions.

Oxygen sensing mechanisms have been implicated in many pathophysiological conditions, including:

1. **Stroke**
2. **Cancer**
3. **Hypertension**
4. **Sleep Apnoea**
5. **Heart Failure.**

Hypoxia can be caused by a reduction in partial pressure of Oxygen, inadequate Oxygen transport or the inability of the tissues to use oxygen.

As a main consumer of energy, the Brain is Particularly Susceptible to the Effects of Hypoxia." - in "HIF1 and Oxygen sensing in the Brain", Nature Reviews Neuroscience, July 2004.

Concerning the State of Multiple Sclerosis

Oxygen, On Its Own, Cannot Bring About A Cure. So, in other words: The Condition (not a disease) of Multiple Sclerosis, is Not A Lack of Oxygen, for indeed, True Multiple Sclerosis, in its origin, it is found to be from; For "Life Is A Continuation." Thus The Treatment for the condition known as Multiple Sclerosis, Is Provided by the Hospitallers Order of the Good News.

For Only when the Mental Attitude of the body, is that, that may with the holding of same bring responses to the physical forces, then, we may give that which we find will be helpful to the body. With care and consistency, and with being hopeful, prayerfully consistent, we may bring conditions that will be much improved to any present conditions. In thine own self, and in thine own mind, in thine own body; to the true spirit of love, that creative influence that is worshiped by man as God, the prayer then:

> ***"The physical conditions that have come upon me are those most necessary for my own soul's development."***

And these then, can quicken that which will make for thine own self, thine own body, thine own mind, being and manifesting that same influence in the lives of those that thou may meet, that thou may contact day by day. Yea, they may bring to thee, with thine own inspiration, thine Own intuitive forces, by applying them in thine own experience, such creative influences, such creative energies, as to Renew thy strength. For His promises have been given:

> ***"Those that love me will I renew, even as the strength of the unicorn, as the flight of the eagle, and thy days and thy habitation shall be called blessed by those that know thee." - Isaiah 40:31 - Rectified Bible***

Then, use those influences in the material world. For All force, all power that is manifested in a material world: can, and only does come from that universal force, that creative energy we worship as God; that which we may renew in its proper associations, its proper activities and relations to self, that which not only builds a physical body, that builds a strong determination for a usefulness in thine own mental body, but makes for that beauty in the soul development, that will bear thee up in thy periods of destructive influences that come.

The shadows, and thy fears that make men afraid will be cast away, for: "If ye will be my children, I will be your God." Has been the promise to all.

And, "I will bear thee up lest at any time ye dash your foot against a stone."

Then, in making application, my son, of these things in thine own experience, approach them not with fear and trembling; rather as that which is thy birthright. "Seek and ye shall find; knock and it shall be opened unto you."

For This day there is set in thine own experience that which, if thou will apply in thine own material body, thine own material experience, will Renew

thee even as His promises have been.Thus in the physical body, it is necessary for the adding to same in such measures, in such a way and manner that we may bring to the nerve tendons, to the lymph and blood circulation, that which will carry into and through the locomotories of the body the abilities in the centers for that strength, which will make those portions in the lumbar and sacral areas, in the heart's action, in all the activities of the body, able to Renew their strength.

Emunctology: is in itself of the scientific nature; in part dealing with the Emotions and the Mental Attitudes, and Aptitudes of individual activity, yet, it is capable in Affecting groups, and the masses, it serves, of its teachings; to allow for the analysing of the emotions, and the activities in those things pertaining to the relationships of applications of emotional natures that may be made as an application to the physical welfare of individuals.

In the development in those fields of activity pertaining to the relationships, and actions necessary for the application of things to the Body-Functionings of individuals. The Order, in its expression of service through Emunctology, allows for the soul forces, a way, a manner, in which each may minister in such ways measures and manners, that may not only bring material remuneration for the physical activities and associations of the body but will make for a mental, physical, material, and spiritual development that should be Most satisfying.

For Emunctology, offers that opportunity for the greater expansion in the abilities of self to be of service to its fellow man; also the greater opportunity for the expansion in those relationships of individuals in such measures, and manners as to bring contentment. These only lend the very opportunity for the self to become more absorbed in the greater opportunity, and chance for application of the abilities in self. Through these channels there is offered the opportunity to make self, as it were, one indispensable in the experiences of individuals whom the entity may contact in these environs.

Yes, it is in keeping with that which We find would make for the greater opportunities to apply self as a life's work in these directions.

By applying not only the mental and material things but also the deeper things. Not to become goody-goody, no.

Not to become one as a Quaker or Shaker; neither be one that is a jerker, nor a shirker; but one that would apply self in the mental, in the material, and in the Spiritual opportunities, as presenting to each individual. For when there are those applications by those that would heal the bodies, who would make the outlook upon life the greater in those directions where there might be more comfort and more ease, unless the basis for those things is in the spiritual, they must, as ever, become as naught! But apply self in such a way that each life contacted is not only better, but desires within itself to apply self for a greater service to its fellow man, that its presentations and appreciations of life itself may be the better manifested and applied in its activities throughout the earth.

In these channels, and in this way, may an individual apply self; studying all phases of those things that may be applied to the physical, the mental and, most

necessary of all the Spiritual; for the spiritual foods are necessary.

Be not impatient, but work and pray, work and think, and not only of self, but as to how that self may be of a greater help and aid to its fellow man in all phases, and activities that may present themselves through these varied relationships that are brought about by the environs. Not only being good, and apply same in individuals lives, but: good For Something!

Oxygen Absence Promotes a Survival State in Cancer Cells

"During the last century, it has been established that regions within solid tumors experience mild to severe Oxygen deprivation, due to aberrant vascular function. These hypoxic regions are associated with altered cellular metabolism. Oxygen (O2) is required for aerobic metabolism to maintain intracellular bioenergetics and serve as an electron acceptor in many organic and inorganic reactions. Hypoxia, defined as reduced O2 levels, occurs in a variety of pathological conditions, including stroke, tissue ischemia, inflammation, and the growth of solid tumors.

Early Demonstrations of Tumor Hypoxia

Before hypoxic cells could be visualized in tumors, their presence was inferred by some astute observations. In 1955, Thomlinson and Gray studied histology sections of human lung tumors and observed cells growing in "cords" running parallel to vascularized stroma. In large cords, they noted a necrotic core surrounded by a region of viable cells neighboring a capillary vessel. **They proposed that necrosis was due to insufficient O2, and nutrient supply to the rapidly expanding tissue.** Regardless of cord size, detectable bands of live cancer cells lying between the necrotic core and the surrounding stroma were consistently 170 microns in width, approximately the calculated distance of O2 diffusion (145 microns). **They proposed that the edges of such necrotic cores harbor viable hypoxic tumor cells. Other human tumors, such as cervical and renal carcinomas exhibited similar histological characteristics, suggesting that this was not unique to the lung**.

The Role of Hypoxia-Inducible Factors in Cancer

Based on the analysis of human cancer biopsies and experimental animal models, it has become increasingly clear that hypoxia-inducible factors play a critical role in cancer progression. Gray made the direct connection between tissue oxygenation and tumor cell, a principle known as the "O2 enhancement effect".

Experiments conducted by Richard Hodgkiss and colleagues in the late 1980s demonstrated that the oxygen effect required O2 to be present, leading to the “oxygen fixation” hypothesis. **Hypoxia is commonly observed in inflammatory states.”** - in “The impact of O2 availability on human cancer”, Nat. Rev. Cancer, December 2008.

> ***“Hypoxia (when oxygen levels in a tissue are low), is a feature of cancer, and often indicates that cancer is growing aggressively. Hypoxia stimulates the growth of blood vessels within tumours, which can fuel the spread of cancer cells to other parts of the body.”*** *- in “Nobel Prize for Medicine 2019: Oxygen sensing in cancer”, The Institute of Cancer Research, 17 October 2019.*

The Discoveries of How Cells Sense and Adapt to Oxygen Availability

“The mechanism for one of life’s most essential adaptive processes.

They established the basis for our understanding of how oxygen levels affect cellular metabolism and physiological function. Their discoveries have also paved the way for promising new strategies to fight anemia, cancer and many other diseases.

Oxygen At Center Stage

Oxygen, with the formula O2, makes up about 20% of Earth’s Atmosphere.

Oxygen Is Essential for animal life: it is used by the mitochondria present in virtually all animal cells in order to convert food into useful energy.

Otto Warburg, the recipient of the 1931 Nobel Prize in Physiology or Medicine, revealed that this conversion is an enzymatic process.

During evolution, mechanisms developed to ensure a sufficient supply of Oxygen to tissues and cells. The carotid body, adjacent to large blood vessels on both sides of the neck, contains specialized cells that sense the Blood’s Oxygen levels. The 1938 Nobel Prize in Physiology or Medicine to Corneille Heymans awarded discoveries showing how **blood oxygen sensing via the carotid body controls our respiratory rate by communicating directly with the brain.**

Hypoxia-Inducible Factor Enters the Scene

In addition to the carotid body-controlled rapid adaptation to low oxygen levels (hypoxia), there are other fundamental physiological adaptations.

A key physiological response to hypoxia is the rise in levels of the hormone erythropoietin (EPO), which leads to increased production of red blood cells (erythropoiesis).

The importance of hormonal control of erythropoiesis was already known at the beginning of the 20th century.” - in “2019 Nobel Prize in Physiology or Medicine”, The Nobel Assembly at Karolinska Institutet, 7 October 2019

Cancer And Hypoxia

"Hypoxia is a critical hallmark of solid tumors and involves enhanced cell survival, angiogenesis, glycolytic metabolism, and metastasis.

Hyperbaric Oxygen Treatment has for centuries been used to improve or cure disorders involving hypoxia and ischemia, by enhancing the amount of dissolved oxygen in the plasma and thereby increasing O2 delivery to the tissue. Solid tumors often contain areas subjected to acute or chronic hypoxia, though with variable severity in patients both within and among different tumor types. Studies have Demonstrated that Hypoxia Is Implicated in the Resistance to conventional therapy. The epithelial-to-mesenchymal transition in cancer, has been shown to be Induced by Hypoxic Conditions, Leading To Cancers with an invasive or metastatic phenotype. Hyperbaric Oxygen can be used to overcome hypoxia. Hyperbaric Oxygen is based on administration of 100 % Oxygen at higher than normal atmospheric pressure. Hyperbaric Oxygen Treatment Enhances the Amount of dissolved Oxygen in the Plasma, thereby increasing O2 tissue delivery independent of hemoglobin. As in normal tissue, the partial pressure of Oxygen (pO2) in cancer tissue increases significantly during Hyperbaric Oxygen exposure. Hyperbaric Oxygen Therapy is today accepted and routinely used for many disorders, related to both ischemia and/or hypoxia.

Oxygen And Wound Healing

Oxygen Is Required For All Major Processes Involved in Wound Healing; including resistance to infection, activation of fibroblasts, collagen deposition, angiogenesis, and epithelization.

Oxygen And Cancer

Research studies have shown that Hyperbaric Oxygen can be Inhibitory; And Reduce Cancer Growth in some cancer types, like Breast Cancer." - in "Hyperbaric Oxygen Therapy and Cancer, a review", Target Oncol., December 2012.

Oxygen In The Body System

Energy inside cells comes in the form of Adenosine Triphosphate (ATP), a molecule that carries energy within cells. **Oxygen's Main Function in the body is to enable aerobic respiration, the process that generates the vast majority of a cell's energy in the form of Adenosine Triphosphate.** This energy is essential for all bodily functions, from muscle movement to thinking and digestion.

Oxygen is the final electron acceptor in the mitochondria during cellular respiration, and without it, cells cannot efficiently break down fuel (like glucose) to produce the energy needed for survival

Most Conditions that Disturb the Physical Functioning, such as those indications of a Trembly Feeling, Are From Distresses, From Pressures That Are Produced In The Circulations.

These can be aided, if taken those properties for loosening oxygen in the system, for the clarifying of the blood stream.

Also it taken, Carbon Ash loosens Oxygen in the System, that allows the Blood supply to be clarified the better.

This will combine most in the system as a resistance by the releasing of Oxygen in the system, with that of the Ultra-Violet is better in the Blood, and the releasing of same.

With the Ash, with the electrical reactions for same, the Ultra Violet Ray, for this loosens the Oxygen in the system in such a manner as to create more of that Ossification in System Necessary for Bone Structure.

Method as being taken, those of the Animated or activated Ash, 1/8 grain taken about 30 to 45 minutes before the ultra-violet light is given.

Do not give the light too strong, nor too close to the body, and the body should Not be Reclining when given; Rather that of the erect position, and this applied to the Cerebro-Spinal, rather than to the chest.

This will allow the activity of more Oxygen in the system.

The use of more Oxygen in the system, which may be taken through the oxygen tanks, or Hyperbaric Oxygen Therapy, as well as the releasing of same by taking the animated ash with the addition of the ultra-violet over those portions of the system, not direct on the incision or injured portions themselves, but rather from where the supply of blood is governed by the ganglia of the nerve system that carry it in its circulation through the portion.

For physical healing, wherever there may be plenty of Oxygen as may be created for the system, this is helpful.

Toxaemia And How It Affects Oxygen Levels in the Body

When a Body is in a state of Toxaemia, it produces very bad circulation upon the activity of all the organs of the system; including the throat, bronchi and larynx. The lung becomes involved through the lack of the blood flow sufficient to make for a fullness through same. Thus we may have only a half breath, or not more than 66% of the lung area expanding to the breathing. This naturally makes for the inclination towards lack of the oxidization, or sufficient Oxygen in the system. These make for again, the lack of the ability of the blood supply to cleanse itself; hence making for a reaction upon the whole of the hepatic circulation, producing toxic forces and poisons; combined with the lack of the proper circulation and coagulation. Hence these can cause those indications of the hot and cold sensations. Even when a body may be perspiring freely, in portions there will be those inclinations or feelings of lack of proper circulation, and the liver, the spleen, the pancreas all become somewhat involved.

Neuropathic Manipulation, Ultra Violet, Vibration

Manipulation Neuropathicaly Given, would be well to be given often (every other day). All of these may be given at Once, or one following the other.

Taking the vibratory forces last, to be sure.

The ultra violet, the Manipulation Neuropathicaly Given (that is, the Massage), thus beginning with the extremities (on the hands, on the toes), and working toward the body, Thoroughly, all along the lines, not only of the main nerve centers, but along the trunk lines, also of nerves in arms, shoulders, neck, head, body, limbs, All, work Toward the body. Not away From.

For Massages for limbs and body, will bring better conditions, if all work together. With the manipulations, allow for the precautions as to the Diet (Health Food Choices), and with the activity of the body more in the open, for these all work together to relieve the body. The loosening of Oxygen in the system throughout, purifies the blood in the system, and the manipulations give the proper coordination for Eliminations In the system, without causing distress in Any One direction, or without causing disorders from the refuse being thrown in the system. Once a week, or twice a month, have a General Massage Osteopathically given, these, with those things as has been given as the Diet, to make an even balance in the system, will bring about the more active, and the faster recuperations for the body.

Take first, through the system, plenty of Oxygen in the system.

Fresh Air from the outside, either by taking from the condition, or from those of pleasant scenes and surroundings and of a rarified condition of the air, or those conditions produced by manipulation of the muscular forces of the body by the limbs, by exercise, as much with the air as possible, all times, keeping the body warm. Stimulation by electrical forces to the nerves supply, at the solar plexus center, at the 9th dorsal, from those of low origin of electric force, or by those produced by manipulation of the hands or the heat from the hands produced to the same.

The Spinal Cord in Disease Processes

"The spinal cord; acts as an organizer, not only of normal adaptive behaviour, but also of disease processes. Spinal Cord segmental relationships are not the basis for normal neurophysiologic function or activity but are prominent in clinical practice. Examples are situations in which tissues and organs may be disturbed by each other through shared nerves and cord levels.

The injurious factors that may invoke segmental facilitation, other than direct trauma to the spinal cord, are disturbances in afferent input from the musculoskeletal system or the viscera and/or physicochemical disturbances in neuronal excitation and conduction. Some of the consequences of these disturbances are described.

Osteopathy attributes adequate significance to the role of the spinal cord as an organizer of disease processes.

Spinal Cord: Information and Command Center

The spinal cord is the origin of most of the innervation of the body. It is that portion of the central nervous system where, by far, most of the nerves originate. Indeed, every tissue and organ of the body receives some kind of innervation from the spinal cord.

The spinal cord is the site of entry, via the dorsal roots, of most of the "information" about the body itself. It is in the cord that impulses from most of the tissues of the body receive their first screening, gating, arranging, and routing for transmission elsewhere, including the brain. As the site of origin of the "final common path", the spinal cord is also the final command center.

Orders that are issued, consciously or unconsciously, in the higher centers, for most of the motor activity of the body, are issued to the spinal cord, which recodes them, so to speak, and then composes and dispatches the actual orders to the muscles, innervated by motoneurons, and to other tissues and organs, innervated by the autonomic nervous system. The latter includes blood vessels, viscera, sweat glands, et cetera, innervated by the sympathetic nervous system, which has its entire origin in the spinal cord, as well as those visceral structures that receive their innervation from the sacral portion of the parasympathetic division of the autonomic nervous system. For the moment, our concern will be with the activity of the skeletal musculature. In a sense, therefore, the spinal cord is the keyboard on which the brain plays when it calls for activity or for change in activity. But each "key" in the console sounds, not an individual "tone", such as the contraction of a particular group of muscle fibers, but a whole "melody" of activity, even a "symphony" of motion. In other words, built into the cord is a large repertoire of patterns of activity, each involving the complex, harmonious, delicately balanced orchestration of the contractions and relaxations of many muscles. The brain "thinks" in terms of whole motions, not individual muscles. It calls, selectively, for the preprogrammed patterns in the cord and brainstem, modifying them in countless ways and combining them in an infinite variety of still more complex patterns.

Each activity is also subject to further modulation, refinement, and adjustment by the afferent feedback continually streaming in from the participating muscles, tendons, and joints.

Our concern until now has been with muscles and motor activity, but it is important to recall that the spinal cord is the site of origin also of the Sympathetic Nervous System. This anatomic intimacy between the sympathetic division of the Autonomic Nervous System, and the Somatic Nervous System is most appropriate, since it is one of the main functions of the Sympathetic Nervous System, continually to tune visceral, metabolic, and circulatory activity to the rapidly changing requirements of the skeletal musculature.

Every motor activity, organized via the somatic innervation originating in the spinal cord, also involves the simultaneous, coordinated activity of the Sympathetic Nervous System and the tissues and processes regulated by it. "Spinal patterns", therefore, must be viewed not merely as motor reflex patterns but as somatosympathetic patterns.

Myths and Misconceptions

Among the most persistent myths is that the 2 divisions of the Autonomic Nervous System:

1. The Sympathetic,
2. The Parasympathetic;

Are equal and opposite moieties, one being inhibitory where the other is excitatory, one positive, the other negative.

The implication usually conveyed is that normal life is a nicely balanced tug-of-war between these two divisions, and that it is the physician's function to redress "autonomic imbalance", usually with appropriately -lytic or -mimetic medications.

Although this view is widely held by physicians (and others), it will be shown that the 2 divisions are vastly different systems.

Indeed, only one of them, the sympathetic, can truly be called a system.

They differ in their basic design, central origins, peripheral distributions (overlapping though it is), and the sensory stimuli to which they respond." - Dr Korr, Professor, in "Journal AOA" September 1976; "The spinal cord as organizer of disease processes: The peripheral autonomic nervous system", 1979.

Note: **Dr Korr, uses musical analogy for the role of the sympathetic system in "tuning visceral, circulatory, and metabolic activity", necessary for systemic coordination. Extending musical metaphor to the entire Spinal Cord which is the "keyboard on which the brain plays when it calls for activity."**

The vibratory cascade results in a "symphony of motion" – a "complex, harmonious, delicately balanced orchestration."

> ***"Nothing seems too hard, too great, or too difficult for prayer to do. It has obtained things that seemed impossible and out of reach. It has won victories over fire, air, earth and water. Prayer has raised the sick. Prayer has raised the dead. Prayer has procured the salvation of souls."*** *- John Charles Ryle, Anglican bishop of Liverpool, in "A Call to Prayer, 1869.*

The Immune System Runs on Oxygen

"Ed McCabe holds a degree in Educational Media, from the University of Massachusetts, is a leading international author, lecturer of Oxygen and Ozone Therapies. His ongoing involvement with advanced healing modalities encompasses a span of over 25 years. As a journalist, he solely focused upon studying Oxygen Therapies during 12 years of intensive investigation, research and experimentation. He is the first and only one to create a modern mass public awareness of the existence and benefits of Oxygen and took and Ozone Therapies.

One milestone in his career was when, along with Senator Tom Harkin, and former Congressman Bedell organized and brought former "AIDS" patients and their doctors to the top levels of the National Institute of Health.

The Patients Had Become Healthy by Using Oxygen Therapy

> ***"After all your immune system runs on Oxygen, and disease causing microbes like most of the bacteria cannot live in."*** *- Ed McCabe*

His Book "Oxygen Therapies, A New Way of Approaching Disease", 1988, was the first book to detail every known therapy that used **Oxygen to eliminate disease and restore health by ridding the body of toxins and microbes, while simultaneously boosting the immune system.**

> ***"We can do anything unless we believe we can: Consciousness Is Everything. Most importantly, in the healing area, I discovered that there is a triad of concerns that need to be balanced before real long term healing can be effected: Mental, Spiritual, Physical, Emotional. Above and beyond these areas, as if you are looking down on the top of a pyramid, The Spiritual is the invisible thread that ties them all together yet remains apart from their dualistic natures. For us to be in harmony, all four need to be faced, examined, and balanced. You won't be healthy long if you abuse your body in the areas of food, drugs, rest, breath, or exercise, or if you give in to excessive anger, lust, greed, attachment, or vanity. You also won't be healthy long if you dwell upon thinking badly about yourself or others, or deliberately, somehow, reduce or abberate your incoming and outgoing flow of the Life Force. If you do these things, whether by conscious choice or not, disease and suffering follow. If not right away, then eventually, as it is Nature's way of getting you to wake up and see how you are Being, as part of the Whole.***

My Oxygenation Experiences

> ***The first thing that happened was that my intestines emptied accumulated waste-matter heavily for 3 days. A week went by and then I started coughing and***

expectorating. This lasted for about 2 months. This is what happened to me: First, my intestines started dumping out toxins, much like a Colonic, or Enema. This could have included many forms of freshly expired anaerobic bacteria. Then the individual body cells began to be oxygenated, dumping out their own accumulated toxins. My metabolic rate increased to the point of fever, to burn up these toxins for elimination. Then the extra oxygen released into my bloodstream started to bubble out of the blood in the air/blood exchange area of my lung bronchial sacs. This happened underneath the coatings of accumulated toxins left over from my many bouts of childhood bronchitis. The layers loosened, and as they broke up, I expelled them. Other people have had other cleansing reactions such as rashes, or none at all, depending on how clean their cells were when they started. I have since found out that I could have avoided some of the unpleasant reactions by first Cleansing my Colon. I believe the reactions were all beneficial, because I have not been sick since. I used to get the flu and colds constantly. I also Cleaned out my Colon. Here are my "side effects" or results, since the cleansing, they're given to you with my intuitive subjective conclusions: So far, I have not had a cold or flu in over 2 years, where I used to be sick approximately 4 times a year. I also have fewer and lesser allergic reactions now, my hay fever has stopped." *- Ed McCabe, in "Oxygen Therapies, A New Way of Approaching Disease", 1988.*

The Medical Trade Imprisoned Ed McCabe

In 1998 Ed McCabe's was sudden Imprisoned for 18 months.

His house was raided, and his computer, books, and research files taken, through the use of warrants that were "sealed."

Ed was sent to live with criminally insane prisoners in a Federal Mental Hospital for 1 month, of punishment as an "evaluation."

He dared to question in Court what they were illegally doing to him.

He went through 11 other prisons.

For a total of 18 days, he was locked in leg, arm and waist chains.

Despite not breaking any regulations, was locked in solitary confinement, and cut off from all human contact on 5 separate occasions, for a total of 2 months, 4 of them before going to trial.

A Federal Binghampton, New York Judge, a Syracuse NY Magistrate, an Asst. United States Attorney, and 2 IRS Agents were actors to imprison Ed.

There was no valid Grand Jury vote. The court transcript has lies in it.

They allege they convicted Ed, and have records allegedly proving it; but all their paperwork was concocted using the ruse of actually convicting a fictitious person with an assumed fictitious name for non-liable and non-existent tax violations. Then they put Ed in prison." - in "The Ed McCabe Story, How a Regular Guy Became "Mr Oxygen", Flood Your Body with Oxygen", 1988.

Chapter 9

Concerning Trauma: A Major Factor in The Causation of Disease

"The subject of the Etiological Relationship Between Trauma and Disease, though Always Recognized, Has Not Been Given the Attention which its Importance Merits.

The Role of Trauma Is Unquestionably Overestimated by the lay public.

Other Diseases can be Caused, or Accelerated by Trauma.

The purpose of this symposium is to present The Accumulated Knowledge Concerning the Relationship of a Single Trauma to Disease.

With Few Exceptions, There is No One Exclusive Cause of a Disease.

Several Factors, in Varying Combinations, Usually Constitute the Conditions Under which a Disease Develops.

One of the Factors may be constant — e.g., the specific organism in an infectious process. But this constant specific Factor, Acting Alone, Does Not Always Produce its Disease. The Tissues Must be Prepared to Permit the Development and Growth of the Organism.

A Transient Bacteriemia Often Occurs Without Ill Effects; Only When the Bacteria circulating in the Blood light on devitalized or weakened tissue, do they multiply and produce the infectious disease.

The Secondary, inconstant factor (the lessened resistance of the tissues), May Be as Important as is the Bacterium itself.

The Role of Trauma in the Etiology of Disease Is Similar To That of Any Other Secondary, inconstant non-specific Factor.

A consideration of the Role that Malnutrition Plays in the Production of Disease strikingly illustrates this similarity.

Malnutrition is the direct cause of certain diseases: Scurvy, Rickets, Beriberi.

It is a Secondary Factor in causing certain other conditions, notably Pulmonary Tuberculosis. It is a Factor in this Disease, although many cases of tuberculosis develop without it, and although most undernourished people do not develop tuberculosis. Trauma, as a Factor in the Causation of Disease, should be studied in the same way as Malnutrition.

Much has been learned during the last several decades; much still remains obscure. Certain diseases in which trauma was believed to play a part are now known to be entirely unrelated to it. Certain other conditions are now known to be caused by trauma: a skin burn can produce a duodenal ulcer; a cerebral concussion, from which the patient apparently recovered within an hour, can produce an apoplexy some time later; and a back injury, with negative roentgen-rays 6 days after the accident, may be the cause of a compression of the body of a vertebra found 6 months later." - in "Trauma and Disease", 1941.

"Therapists of various clinical disciplines are now becoming increasingly aware that traumatic disorders involve severe dysregulations of both mind and body. The idea that Many Diseases of Unknown Cause; Are Actually Due to Trauma is not new. But is is surprising to learn that Trauma can be the cause of so many familiar physical disorders. Dr Scaer begins with the:

1. *Whiplash Syndrome.*
2. *Chronic Pain Syndromes.*
3. *Phantom Pain.*
4. *Irritable Bowel Syndrome.*
5. *Cystitis.*
6. *Fibromyalgia.*
7. *Chronic Fatigue Syndrome.*
8. *Reflex Sympathetic Dystrophy.*
9. *Autoimmune Diseases.*

The most surprising and novel idea is his finding that an instinctual freeze reaction to a traumatic experience persists as an influence on the body long after the event.
The traumatic shock captures and holds portions of the autonomic nervous system in a tonic grip that affects blood flow, hormonal secretion, and neurotransmitter balances of the brain. Until a person gets over the trauma the physical and mental symptoms do not go away. Dr Scaer's view of dissociation as an instinctual and physiological response rather than simply a psychological defence opens the door to many new possibilities of treatment for many baffling conditions." - *in "The Body Bears the Burden Trauma, Dissociation, and Disease", 1984.*

Time Factors in Malignant Growths

"There is another aspect from which the possible influence of a single trauma can be examined, and that is the length of time which elapses between the appearance of a malignant growth and the beginning of the action of a known agent or lesion which incites it. The best example of this is the Carcinoma which Appears After Roentgen-Ray Injury to the skin. There are now some 200 examples of this type of carcinoma in roentgen-ray operators; in these a fairly accurate record is obtainable as to the time of the original appearance of the skin atrophy, the date of formation of keratotic lesions, usually on the hand, and the appearance of the neoplasm. While there is some variation in the incidence of malignant processes, they rarely occur in a shorter time than 6 years, and the average is considerably higher, being about 10 years from the appearance of severe skin lesions." - Dr Leila C. Knox, BA, MD, in "Trauma and Disease", 1937.

Trauma and Lymphatics

"Acute Lymphangitis is Always Secondary to Some Infection.

Chronic Lymphedema, with recurrent attacks of streptococcus lymphangitis or typical erysipelas, may be stirred up by trauma.

Thus, a woman, aged 25 years, who had a chronic lymphedema with attacks of streptococcus lymphangitis (culture was obtained by biopsy), went to work in her own house, 3 months after the last flare-up. After 2 days, chills developed and prolonged rest in bed had to be instituted again.

Injury to such a lymphedematous leg is always fraught with the danger of infection, since tissues soaked with retained lymph are notoriously susceptible to infection.

The most trifling injury causes a lymph flow and should lymph be infected, a spreading infection results.

It is difficult, at times, to separate Venous Stasis and Lymph Stasis, as the lymphatics run with the large veins, whose closure or inflammation may readily affect the lymphatics and produce a lymph blockade.

The repair of the lymphatics, following trauma is very active, and unless an extensive obliterating lymphangitis develops, a simple block of the lymphatics is quickly overcome. Thus, even a radical removal of all the lymphatics in the axilla is not followed by an edema of the arm, unless an obliterating lymphangitis, infectious or carcinomatous, supervenes.

Trauma and the Vasomotor Apparatus

The intimate anatomical and functional relationship of the bloodvessels to their vasomotor innervation naturally is altered in cases of trauma to bloodvessels. The intricate network of sympathetic fibers is affected by such trauma.

Little attention has been paid, in the past, to the rather vague and poorly understood phenomena arising from this source.

A study of these disorders, however, explains many heretofore ignored or misunderstood signs and symptoms of trauma to extremities." - in "Trauma and Disease", 1941.

> ***"Traumatism may have acted as an exciting factor to be sure; but there must have been a dyscrasiae behind the traumatism, else cancer from traumatism would affect al most every part of the body alike and would be far more common, even, than it is.***
>
> ***The Breasts are Glands. Most Glands are the catch basins for the deposit of unreduced metabolic ash, magazines for the reception of toxins that our systems do not eliminate. Glands are the lowest type of human cell-structures, the least resistant to external influences of all the tissues of the body, and become the choked sewage-repositories of the human residence."*** *- Dr C. E. Fisher, MD, in "The Medical Advance", August 1902.*

> ***"Sloan and Woods call attention to the fact that homonymous defects in the visual fields when present in patients with neurosyphilis appear to be dependent on such factors as Cerebral Trauma and Arteriosclerosis with vascular accidents** rather than on syphilitic involvement of the optic tracts or radiations." - in "Perimetric Studies in Syphilitic Optic Neuropathies", Arch. Ophth., August 1938.*

"Edgren points out that the most widely accepted opinion concerning **the cause of Chorea Minor is that it has some connection with a Rheumatic Infection.**

Bacteriologic examinations of the brain, the spinal fluid, and the blood of patients with Chorea Minor (uncoordinated jerking movements), have yielded Diplococci, Staphylococci, and Streptococci.

The pathoanatomic aspects of the brain vary; **embolisms, congestion and small hemorrhagic foci have been observed.**

Moreover, attacks of Chorea Minor have been known to alternate with attacks of Acute Polyarthritis or Endocarditis, and Infections of the Throat, Measles, Scarlet Fever, and Influenza have been suspected of connection with Chorea Minor.

Other investigators have suggested Dysfunction of the Parathyroid Glands, and Psychic or Physical Traumas, as Causal Factors of Chorea Minor." - in "Etiologic Factors in Chorea Minor", Acta Med. Scandinav., 30 June 1938.

> ***"As to the etiologic factors in Cortical Atrophy (onset dementia affecting vision, caused by damage to brain cells): The records of the few published cases show a variety of causes: Intoxications, such as those due to lead, carbon monoxide and alcohol; trauma, and infectious processes. In my case there was a history of being gassed, followed early by the onset."** - Dr Joseph C. Yaskin, MD, in "Archives of Neurology and Psychiatry", June 1939.*

"Trauma is used here in the sense of a physical injury to some part of the body. Before proceeding with the discussion of our classification, one must bear in mind that within recent years the role of trauma in the etiology of disease has assumed great practical significance.

Previously, psychiatric schools of thought, like those in other branches of medicine, were interested mainly in direct causes.

However, the development of compensation laws has led to the need for a reorientation of thought.

The practical demands for medico-legal opinions concerning the partial, in addition to the complete, part played by trauma in the causation of an illness have required more consideration of the influences of trauma as an accessory factor. In Neuropsychiatry this problem is particularly complicated because one must take cognizance of both organic and psychogenic factors, especially when the injury is directed toward the head and brain.

With much available knowledge yet at the descriptive level, some so-called syndromes are not specific.

In many instances neuropsychiatric syndromes may be caused by either Organic, or Psychogenic agents, and Constitutional factors are always important.

The diagnosis of each neuropsychiatric condition must be approached with this threefold concept (that of the: Organic, Psychogenic, Constitutional factors), and the most that can be said in many cases is that there is a combination of all 3, probably with especial emphasis on one factor.

In the final analysis, each case must be judged separately after a complete investigation of the previous constitutional tendencies, the psychogenic shock and the specific physical effects of the trauma." - Dr Kart M. Bowman, MD, Dr Abram Blau, MD, in "A Revised Classification of Mental Sequelae of Trauma to the Head", Archives of Neurology and Psychiatry, June 1939.

> ***"Axon regeneration failure following central nervous system trauma and disease often leads to permanent functional disability."*** *- in "Axon growth and synaptic function: a balancing act for axonal regeneration and neuronal circuit formation in CNS trauma and disease", Developmental Neurobiology, 9 September 2020.*

"Injury does act as a real precipitating factor in a small proportion of cases of nearly every disease.

And a truly scientific study of how trauma lights up (say) poly-arthritis or cancer would throw some light on the mechanism of the disease.

15 years ago I secured a copy of G. B. Stern's brilliant and exhaustive monograph "Trauma in Internal Diseases", 1945.

Furthermore for years before that I had preserved G. F. Walker's excellent article "Injury and Internal Disease", British Medical Journal, 3 May 1941.

Both of these distinguished men were recognized authorities, and they had treated injury in a detached and scientific fashion, as a factor which must be taken into account when it has immediately preceded the onset of any disease." - Dr Michael Kelly, MD in "Archives of Internal Medicine", 1963.

> ***"Concussion of the spinal cord may cause immediate symptoms, or they may be delayed for several weeks.***
>
> ***The more severe traumatism usually produce the more immediate symptoms.***
>
> ***A subacute myelitis may not give symptoms until a month after the accident.***
>
> ***Other Spinal Cord Diseases more or less degenerative in character, such as tabes and chronic myelitis, May Follow Trauma, though no doubt In Most Cases the Traumatism Only Cooperates with Other Causes, especially syphilis.***

> ***Many cases of progressive muscular atrophy apparently originate from severe strain or other injury to a limb. The muscular atrophy depends on a damaged nutrition of the motor cells, this derangement being the effect of morbid impulses from the irritated nerves of the injured joint."*** *- in "Trauma and Disease of the Nervous System", Brit. Med. Jour., 30 April I904.*

"Skeletal remains can preserve a record of events in the life of the individual, including traumas, which are any type of wound or injury, and disease.

The effects of such events provide significant information about the past, both recent and distant, in which the individual lived.

Far example, a high frequency of healed fractures or wounds in males may suggest continual wars or raids, and a high frequency of pathologies in young children may suggest inadequate supplies of weaning foods.

Fractures are among the most common traumas that affect the bones.

A wealth of tumors and tumor-like processes may permanently affect the bony skeleton. Aside from the gross appearance of a tumor, its location may provide clues as to its origin, since different tumors occur characteristically in different regions of the skeleton.

However, it is easy to confuse exostoses, or irregular outgrowths of bone, resulting from injuries (as when extensive hematomas ossify) with exostoses caused by cancer or similar disease processes.

There is little information on the incidence of such pathologies in ancient populations. A relatively common tumorous condition is an osteoma, which is observed as a lump or mound of compact bone, varying from a small button osteoma to a quite large growth. Osteomata are benign tumors formed in areas in which the bone normally ossifies intramembranously, for which reason they are common on the vault bones. It is not unusual for an individual to show several osteomata. They are often asymptomatic during life.

Malignant bone diseases include osteosarcomas and multiple myelomas.

Osteosarcomas typically involve the production of malignant bone tissue, osteoid, or cartilage; the most common site is the distal femur.

They usually occur in individuals between the ages of about 10 and 25.

In contrast, multiple myelomas occur almost exclusively in individuals over 50 years of age.

They involve a cancerous growth of Plasma Cells in the Bone Marrow and therefore are found predominantly in bones that contain a lot of marrow in adults: the vertebrae, ribs, pelvis, and cranial vault." - in "Trauma and Disease", The Human Skeleton, 1985.

Axillary Lymph Node Metastasis

"The main route for Lymphatic Metastasis from breast carcinoma is through the axilla, the Axillary Nodes being the first to be involved in the regional lymphatic filter. For a variable period of time the Axillary Nodes are usually the only regional nodes involved. The best proof of this is the fact that a considerable proportion of patients with not too extensive Axillary Node involvement are cured by radical mastectomy in which the Axillary Nodes, but none of the other regional Lymph Node groups, are removed.

Age of the patient has any significant relationship to axillary metastasis.

The Relationship of the Site of the Primary Carcinoma in the Breast to Axillary Metastasis." - in "The Lymphatics in Cancer", 1972.

The Emunctologist should know that Faecal Stasis (Constipation), which results from Bad Food Choices: Is The Major Factor in the Burden placed upon the Lymphatic Circulation, which then leads to Lymphatic Stasis; which in turn Becomes Toxic, and thus Carcinoma appears first in the Axillary Nodes.

If then this Toxicity spreads (metastasis) via the Lymphatic System, to the Breast Lymphatic Nodes, then Breast Cancer (Carcinoma) will settle and grow in the Breast Area.

Cancer of the Colon and Rectum

"1. Chronic Irritation:

The so-called Benign Lesions of the lower bowel, are the chief factors in the production of cancer in this region. Cancers of the Colon Originate in the Crypt Cells. While all carcinomas of the colon may not originate in polyps, evidence is accumulating that most of them have their origin in just that way.

2. Trauma:

It must not be overlooked that the cecum and the rectosigmoid are the most common sites of Colonic Stasis, and they are also hosts of the Great Majority of Carcinomas of the Large Intestine." - Dr Charles J. Drueck, MD, FACS, in "Cancer of the Colon and Rectum", Journal of The National Proctologic Association, November 1941.

Chapter 10

The Importance of The Microbiome

*“**The Microbiome: 100 Trillion Bacteria of Several Hundred Species.**” - in “Microbes Maketh Man”, The Economist, 18 August 2012.*

What Immunity Means?

*“**Immunity Means That No Abnormal Cell Can Grow or Develop in the Body With Normal Metabolism.**” - Dr Max Gerson, MD, in “A Cancer Therapy”, 1958.*

*“**I learned about the importance of Microbiome and Immunity because of the importance of the relationship between inflammation in the gut and the immune system.** Then around the year 2000, that's when the medical literature started talking about **the Bacteria, and it's the Bacteria that matter.** That was in 2000, now we actually have something called the “**Human Microbiome Project**”, which is very similar to the “Human Genome Project”.” - Dr Joel Evans, MD in “Interconnected”, Docuseries, 2018.*

“I've been doing Microbiome testing since it first became available.

I started doing the earlier stool testing where you look for certain organisms to see if they would grow, look at them under a microscope.

But then **when the DNA Testing came out, we called this Sequencing Based Testing. I was an early adopter. At first there was a lot of excitement about it.**

We though, okay, we are going to find the one bug that caused Rheumatoid Arthritis, or the one bug that caused Autoimmune Thyroiditis.

And we had pretty good literature that appeared to show those associations.

The problem is that when I actually started doing the Testing I didn't find those bugs.” - Dr Robert Rountree, MD, in “Interconnected”, Docuseries, 2018.

*“**The question is, a lot of people have Helicobacter.***

***Only a few people get ulcers, and a few people get stomach cancer. So why is it those people and not the others?**” - Dr Martin Blaser, MD in “Interconnected”, Docuseries, 2018.*

*“**So the key concept is once your Microbiome loses its diversity you lose tolerance. And as your Microbiome goes more diverse you gain tolerance, and then you're not as reactive to yourself or to the food proteins or chemicals around you.**” - Dr Datis Kharrazian, Research Fellow, Harvard Medical School, in “Interconnected”, Docuseries, 2018.*

"All of us are constantly seeding the world with our microbes.

Every time we touch an object, we leave a microbial imprint upon it.

Every time we walk, talk, scratch, shuffle, or sneeze, we cast a personalised cloud of microbes into space.

Every person aerosolises around 37 Million Bacteria per hour.

This means that our microbiome isn't confined to our bodies.

It perpetually reaches out into our environment.

The microbes in our bodies are part of our immune systems and protect us from disease. In the deep oceans, mysterious creatures without mouths or guts depend on microbes for all their energy.

Bacteria provide squid with invisibility cloaks, help beetles to bring down forests, and allow worms to cause diseases that afflict millions of people.

Many people think of microbes as germs to be eradicated, but those that live with us — The Microbiome — build our bodies, protect our health, shape our identities, and grant us incredible abilities." - Ed Yong, in "I Contain Multitudes, The Microbes Within Us and a Grander View of Life", 2018.

"Over 80% of the bacteria on your right hand are not found on your left hand.

Some part of the mother's milk is not used to nourish the baby, but the developing microbiome in the baby. So we see breastfeeding as obviously a way of nourishing an infant. But it turns out that about 10% of breast milk consists of these sugars that babies can't digest, and instead they are there to nourish microbes. To nourish specific strains that are specifically evolved to really efficiently eat these sugars. And in return they feed the baby's cells, they shore up the lining of the gut, they quench inflammation. So a mother who's breastfeeding isn't just nurturing her infant, she's also creating this entire world in her baby's body, selecting which microbes get to live with her child.

Fiber is a good thing, fiber consists of a wide range of complex carbohydrates from plants, and that nourishes an equally diverse range of microbes in the gut.

And fiber has many other benefits in the microbiome too, so that's one piece of solid advice. Many animals rely on their microbiome in order to break down these chemicals in plants. Humans do, to an extent (something like a cow), gets 70% of its energy from microbial metabolism. The animal would not be able to survive if it didn't have microbes as partners in digestion." - Ed Yong, in "The World According to Microbes", Science Friday, 5 August 2016.

> ***"It's traditional wisdom that the immune system responds to bacteria,*** *but customarily we think of infectious agents and how the immune system attacks microbes that may be invading us.* ***But what we've learned over the past decade is our immune system is actually augmented, or primed, by the Microbiome. In other words, the Microbiome improves the function of our immune system. It augments certain activities that are not found in the absence of a Microbiome."*** *- Dr Sarkis Mazmanian, Prof. Microbiology Caltech, in "Interconnected", Docuseries, 2018.*

> ***"Remember, one of the key functions of the microbiome is to maintain the gut lining integrity and that part of your immune system. So, helping that to heal after an insult can be really important.*** *And* ***then eating lots of whole, generally plant-based foods. Those fibers, and those whole foods feed the good bugs, and the good bugs grow."*** *- Dr Robin Berzin, MD in "Interconnected", Docuseries, 2018.*

"The immune system actually requires certain bacteria, non-infectious bacteria, for its optimal activity. And if the immune system doesn't function properly then that actually results in human diseases." - Dr Sarkis Mazmanian, Prof. Microbiology Caltech, in "Interconnected", Docuseries, 2018.

> ***"I realized how the Intestinal Tract was the biggest immune organ of the body. The Intestinal Tract could create inflammation if we weren't eating the right things, if we were eating foods that we were sensitive to, and that inflammation could be the underlying cause of so much of the chronic complex illness that we see today."*** *- Dr Joel Evans, MD in "Interconnected", Docuseries, 2018.*

"If you look at a lot of Chronic Diseases, like Heart Disease, and Hypertension, and Diabetes, and Obesity, non-alcoholic Fatty Liver Disease.

All of these Diseases Have a component of Inflammation.

Many of these diseases have probably been made worse by Poor Dietary Choices. Diet matters. There is this idea of food as medicine. And, **what we eat, and the nutrients that we take up, feed all of the cells in our body, just as they feed all of the Bacteria in our Microbiomes."** - Dr Claire Fraser, Director Institute Genome Sciences, University of Maryland, in "Interconnected", Docuseries, 2018.

"So what we like to do is, we like to look at a more personalized approach.

Our heart panel has 27 different markers, **and one is a marker called Trimethylamine N-oxide (TMAO) which is reflectively directly of the Inflammation in the Gut. Again, fire in the gut, fire in the heart.**

And if a person has autoimmune disease she's 10 times more likely to have a Heart Attack. So the inflammation fire of an autoimmune illness can drive the fire of a Heart Attack, and, or Stroke, and most likely Dementia or Alzheimer's as well." - Dr Mark Menolascino, MD in "Interconnected", Docuseries, 2018.

Your greatest ally in health is your microbiome: the Trillions of bacteria that are the control center of your health! One way to improve the microbiome is via Microbiota Transfer Therapy (Fecal Microbiota Transplant):

> ***"Coincident with Autism Spectrum Disorders (ASD), many children and adults, also experience significant Gastrointestinal (GI) symptoms, such as Constipation, Diarrhea, and alternating Constipation/Diarrhea, which correlate with ASD***

severity. Such GI symptoms appear to be due, in part, to dysbiotic gut microbiota and perhaps their missing roles on modulating metabolites that affect GI function and neurobiological conditions, such as ASD and Anxiety.

Many children with ASD often undergo increased oral antibiotic treatment during the first 3 years of life, which is thought to destabilize their gut microbiota, and open opportunities for competitive potential pathogens to contribute to ASD severity.

A number of studies reported that children with ASD have altered gut bacteria profiles compared with neurotypical children.

Children with ASD have lower abundances of fermentative bacteria (e.g., Prevotella copri), and lower overall bacterial diversity. Thus, gut microbiota appears strongly associated with ASD. Together, these findings suggest that Microbiota Transfer Therapy is safe and well-tolerated in children with ASD ages 7–16 years.

Microbiota Transfer Therapy led to significant improvements in both GI- and ASD-related symptoms. This shifted gut microbiota of children with ASD, toward that of neurotypical children." *- in "Microbiota Transfer Therapy alters gut ecosystem and improves Gastrointestinal and Autism Symptoms", Microbiome, January 2017.*

Bacteria Are Pleomorphic Rather than Monomorphic

Bacteria occur in Various Distinct Forms and Shapes (Pleomorphic), rather than existing in only one form (Monomorphic).

Pleomorphism is the ability of some Microorganisms to alter their Morphology, Biological Functions, or Reproductive Modes: In Response to Environmental Conditions. Bacteria may regress or downgrade back to harmless particles, but this process is only possible in a healthy host organism.

"Understanding Pleomorphism, is essential to the understanding of cancer and its cure, and the cure of many other diseases.

In 1975, using the electron microscope, Parmley showed "microorganism-like structures" in lymph nodes in some untreated patients with Hodgkin's disease.

These round forms with "internal composition" were found within and outside of the cells and resembled mycoplasma and cell wall deficient bacteria, suggesting "subclinical infection."

Swiss oncologist Christian Sauter and pathologist Michael Kurrer discovered "intercellular rods" and "spheres" in 6 Hodgkin's disease patients, by use of a special Periodic Acid-Schiff stain, a traditional stain used to detect fungal infection of tissues. When blood pH is shifted out of its narrow range, these tiny microorganisms can no longer live. In order to survive, they change to a form which can survive. It is these new forms that can become aggressive, parasitic and pathogenic agents within the blood.

> ***"Medical Mycologists and Physicians understand that yeasts such as the common Candidas are just a different form of the same fungi. There are many fungal moulds that can turn into a yeast and some of these yeasts turn into a mould. We see this routinely in the laboratory. It is a phenomenon called dimorphism, some of these fungi will also take on additional forms and are known as Pleomorphs. This has been observed for over a 100 years and we now fully understood how and why these various morphologies come into being."*** *- Dr M.J. Dvmanov, Professor of Medical Mycology*

The job of Candida albicans is to recognize and destroy harmful bacteria:

Without it, we would be defenseless against many pathogenic bacteria.

If the number of friendly bacteria is decreased, the immune system is weakened, or other conditions for yeast proliferation occur (diet high in sugar, improper pH in the digestive system) Candida albicans will shift from yeast form to mycelial fungal form and start to invade the body. In the yeast state, Candida is a non-invasive, sugar-fermenting organism, while in fungal state it is invasive and can produce rhizoids, very long root-like structures. Rhizoids can penetrate mucosa or intestinal walls, leaving microscopic holes allowing toxins, undigested food particles and bacteria and yeast to enter the bloodstream. **This condition is known as Leaky Gut Syndrome and that is an explanation for many food and environmental allergies.**

Over the past 100 years there has been much research implicating a microbe as, not the initial cause, but as the final state of cancer. Final cause meaning tumors are not distinquishable from the infections that inhabit them. Rife claimed that the microbe involved in cancer changed forms depending on the terrain it lived in.

Pleomorphic means that bacteria may be different forms of the same microbe.

These microscopic invaders get their energy from blood sugars which our bodies are supposed to be using, and they grow and multiply by eating our bodies' proteins. Their needs can turn into our cravings.

These bacteria are ubiquitous and exist in the blood and tissues of all human beings, part of the basic fabric of life. **Modern medicine refuses to acknowledge the obvious, that bacteria and fungus are omipresent and are just waiting for the right conditions in which to begin rapid multiplication.**

We see this process universally with in death of tissues or in spoiled food.

Rot is an underlying biological mechanism inherent in all earthly species being the natural process of biological decay. In terms of human physiology in the absence of a protective immune response, cell wall deficient bacteria may become pathogenic and foster the development of cancer and many other diseases of unknown etiology.

Cancer cells with their defective cell physiology would certainly create fertile soil for the uncontrolled expansion of bacteria and fungi drawing down upon themselves the full wrath of these infectious agents.

How then can we separate the cancer from the infection when the process would be continuous?

Certainly we know that cancer patients are highly prone to bacterial infection.

> ***"Microbiologists do not recognize or accept the various growth forms and the bacterial "Life Cycle" proposed by various cancer microbe workers. Most bacteriologists do not accept the idea of a bacterium changing from a coccus to a rod, or to a fungus."*** *- Dr Alan Cantwell*

"Under appropriate conditions, bacteria can lose their cell wall and become amorphous, smaller, highly pleomorphic "cell-wall deficient forms."

Under suitable conditions, mycoplasma can enlarge to giant-sized forms ("Large bodies") resembling fungal and spore-like forms. It is vital to be aware of and to recognize such unusual and hard-to-detect forms in tissue microscopic sections because, in my experience, this mycoplasmal form is the form the cancer microbe takes inside the body in human disease.

Microbiologists love to separate (and classify) bacteria, mycoplasma, and fungi, as distinct entities.

In Fact: **There Is Interplay Between All of Them. Besides inhalation, people can become exposed to mould through skin contact and eating mouldy food.**

Toxic Moulds Can Produce Several Toxic Chemicals called: Mycotoxins That Can Damage Your Health.

These chemicals are present on the spores and small mould fragments that are released into the air.

Dr Young states that All Illness Is But This One Constitutional Disease, Its Result Is Mycotoxicoses (Toxicity Caused by Mycotic Infection), or in other words, a yeast and fungus infection - the great decomposers of living and dead bodies.

Blood Is Under pH Control. Ideally it has a pH in a narrow range around 7.3, which is slightly alkaline. A pH around 7.3 is the perfect environment where the normal pathogens in the blood Live In Harmony With The Body.

However, when blood pH is disturbed and is shifted out of that narrow range then Native Microorganisms, in order to survive, would Change To A Form Which Can Survive.

It is these new forms; that become aggressive, parasitic and pathogenic agents within the blood. Dr Guenther Enderlein, a German bacteriologist, contended there are thousands of forms and many of these are able to overcome the body's defense mechanisms, causing multiple disease situations.

When the body's Blood pH changes away from the ideal, it can become an environment for opportunistic microorganisms to grow and flourish." - Dr Mark Sircus, MD, in "Sodium Bicarbonate: Nature's Unique First Aid Remedy", 2014.

The Relation Between Food & Health

"Dietary Factors (Food Choices) contribute to:

1. Hypertension,
2. Obesity,
3. Heart Disease,
4. Stroke,
5. Type 2 Diabetes Mellitus,
6. Cancers, especially Gastric and Colorectal Cancers.

Fundamental concepts in Nutrition, such as the relation between the Gut and Immunity, and the role of the Gut Microbiome in Health and Disease. Highlight How Food is Selected, Ingested, Digested, and Metabolized, allowing clinicians to tailor it as Prevention and Intervention for Many Common Diseases." - in "Nutrition in Medicine", New England Journal of Medicine, 11 April 2024.

> *"When I decided to go into medicine I met Dr Dean Ornish, MD who came to Omaha, Nebraska when I was a senior in high school and showed that if you had a Heart Disease and were scheduled for a Heart Bypass that you could use lifestyle medicine and not need the bypass. Now, 35 years later, we found he was right.* ***And a big factor of the inflammation in the heart that causes Heart Disease is the Inflammation in the Gut. I think of it as fire in the gut, fire in the heart, and also now fire in the brain because what happens in the Microbiome of the gut can drive the Microbiome Inflammation throughout the rest of the body."*** *- Dr Mark Menolascino, MD in "Interconnected", Docuseries, 2018.*

> ***"The normal function of our immune system in this cohabited body of ours is just proper management of relationships. That's your Immune System."*** *- Dr David Relman, MD, in "Interconnected", Docuseries, 2018.*

> *"I shall not enter on the interminable subject of* ***Human Aliment, except to give one or two Hints; Never eat too much."*** *- in "The Physician", The Belfast Magazine and Literary Journal, 1825.*

> ***"Do not ye yet understand, that whatsoever entereth in at the mouth goeth into the belly, and is cast out into the draught? But those things which proceed out of the mouth come forth from the heart; and they defile the man. For out of the heart proceed evil thoughts, murders, adulteries, fornications, thefts, false witness, blasphemies; These are the things which defile a man."*** *- Matthew 15:17-20*

Food: Is The Gateway to Heal Disease

Healthy Nutrient-Dense Food is a powerful tool capable of preventing, and reversing chronic conditions.

> *"I became really passionate as* ***I started to see Food as the Gateway to my Healing. About 18 months later I could really see some drastic improvements. Food was was number one, but so was meditation. So was reclaiming those Periodic Rhythms, those Circadian Rhythms protecting my body from unnatural light, and getting my feet in the ground and you know the Electricity. So I became really passionate about why don't we get taught this stuff? Why is this been removed from our education system?*** *Why are we facing greater, and greater levels of chronic disease?* ***That led me to not just heal myself but turn myself into a vessel for healing."*** *- Jessica Bell, in "Young Builders: Modern Motherhood", Solari Report, 19 May 2026.*

The Healthy Foods bring vital nutrients to cells, supplying:

I. Vitamins.
II. Minerals.
III. Antioxidants.

Directly Influencing:

1. **Inflammation.**
2. **Energy Production.**
3. **Disease Prevention.**
4. **Cellular Repair.**
5. **Hormone Regulation.**
6. **supporting immune function.**

Whole Nutrient-Dense Foods (immune-boosting foods rich in nutrients, antioxidants, and bioactive compounds) a diet rich in prebiotic fiber - rather than Processed Foods (altered from their natural state) - are the most effective way to optimise gut health, regulate blood sugar, and strengthen the immune system.

> ***"The food we eat is one of the leading causes of illness.*** *As malnutrition increases, so too do the associated diseases." - in* ***"How your diet can treat diseases",*** *Follow the Food, BBC, 2022.*

Not Learned to Indulge in Excess Eating

"He Had Not Learned to Indulge in Excess of Eating:

For better or for worse the choice had been made, and the fruit of the tree of the knowledge of good and evil had brought the seeds of death to man as the Law-Giver had promised. Of good for who will deny that man's capacity for service is not greater in the communal life, and, of all the creatures, he most has set himself to succour and to save his kind. For suffering has come with the Law of the Artificial. Man may or may not "save his soul" by the care he lavishes upon the stricken. It is certain he destroys his fellow wholesale and himself in the result.
In the last stages of a civilisation now passing as others have passed, and by the same way:

The Multiplication of Hospitals, Sanatoria, and Lunatic Asylums, on the one hand, and on the other the Elaboration of the Science of Medicine and Surgery, bear eloquent, and all too convincing Testimony to the fact that the outraged Law of the Wild has called for the price of outrage, and civilised man is passing, passing, downhill to the extinction that awaits the Unfit. A county medical officer published lately a statistical account of the health of the school children in a large English county, and the appalling statement was made that: Practically No Healthy Children Remain." *- Dr A. White Robertson, LRCP, S. Edin., in "Studies in Electro-Pathology", 1918.*

All the Gut's a Stage And All The Microbes Merely Players

"The microbiome is an ecosystem of microscopic life (bacteria, fungi, etc...) that exists within and on our bodies. *The genes contained within the microbiome outnumber our own 100 to 1.* ***We are colonized by our microbiome at birth, and the nature of our birth (vaginal or C-section) and the food we eat (breast milk or not) significantly influence which specific organisms colonize us.*** *The host's genetic variation affects microbiome composition, and* ***diet shapes gut microbiota.*** *Research also suggested that humans have even acquired genetic material, in our own DNA, directly from our microbiome through horizontal gene transfer." - in "Biological Anthropology in 2015", American Anthropologist, 2016.*

"How Infection Works:

There is a close connection between Microbes and Humans.

Microbes occupy all of our body surfaces, including the:

1. Skin
2. Gut
3. Mucous Membranes

Our bodies contain at least 10 times more Bacterial Cells, than Human Cells, blurring the line between where Microbes end, and Humans begin.

Microbes in the human Gastrointestinal Tract alone comprise at least 10 Trillion organisms, representing more than 1,000 species, which are thought to prevent the gut from being colonized by disease-causing organisms.

Among their other beneficial roles, Microbes synthesize vitamins, break down food into absorbable nutrients, and stimulate our Immune Systems." - in "What You Need to Know About Infectious Disease", National Academy of Sciences, 2010.

Taking Medical Trade Medication Increases Risk of Infection

"Researchers, analyzed data on 564,969 people 20 to 80 years old, including 188,323 who had been Prescribed Acid-Suppressing Medications.

These Medical Drugs included Proton-Pump inhibitors (such as: Nexium, Prilosec, Prevacid), and histamine blockers, also called H2-receptor antagonists (such as: Tagamet, Zantac, Pepcid). **None of the participants had Inflammatory Bowel Disease, or Bowel Cancer. Over 14 years 22,705 positive test results for Gastrointestinal Infections attributed to C. Difficile, Campylobacter, Salmonella, Shigella, E. Coli bacteria were reported. People who took Acid-Suppressing Medications were about 3 Times as likely to have had a Gastrointestinal Infection as were those who did not take the Heartburn Drugs.**

Acid-Suppressing Drugs may alter the Gut Microbiome, the balance of microbes in the intestine and Increase Risk for Infection." - in "Acid Suppression Medications and Bacterial Gastroenteritis", British Journal of Clinical Pharmacology, 5 January 2017.

> ***"Forget the theory of the microbic origin of the disease, but do not neglect to keep the patient in as near an aseptic condition as possible. Treat the disease with reference to the indications present, and do not treat it as a direct infection."*** *- Dr Finley Ellingwood, MD in "Treating Pneumonia", The Eclectic Medical Gleaner, January 1910.*

"Disease Germs"

"Disease Germs": are mostly man's friend. Their main mission in life is destruction of filth. They are produced by and bred in disease. If you don't want their presence or help, Keep your bodies from Gathering filth, and live on live foods. Most Acute Illnesses are Nature's (God's) method of ridding our systems of waste, which would otherwise cause disease. They are "house-cleanings", "healing crises", preventing collection of dangerous dirt. They are Nature's protecting reactions against existing disease. But for Acute Illnesses, the human race would have ceased to exist long ages ago. Suppression of such protective reactions, however seemingly adroit, is usually the height of unwisdom. A big proportion of chronic disease is a direct result of suppression of Acute Illnesses. Yet the one really impressive achievement of modern Medical Trade "Science", is the increasingly effective suppression of acute illnesses. Believing these Illnesses caused by the "germs", Medicine kills millions of germs, and almost as many men.

Abolishing Symptoms, which are Nature's warnings, or (worse still) evidences of her efforts to heal, without adequate measures to deal with their cause, is merely preventing Nature from achieving her beneficent purpose of protecting us from the consequences of error or sin.

To employ to this end *(as the Medical Trade does)*, means almost invariably destructive and disease, producing in themselves, is surely to plumb the last depths of human ignorance." - Dr Ulric Williams, M.B., Ch.B. in "Hospitals and Hooey or Health?" 1941.

> ***"We are all afraid of germs because we are all ignorant of them. What we should be afraid of is lowered resistance which comes from within. The folly of our topsy-turvy notion leads to much preventable confusion and despair. Instead of developing a proper respect for our own extraordinary powers, conferred upon us by Mother Nature, we endow germs with unnatural powers which they should not possess. Here let me repeat one solemn truth which should be repeated over and over each day until everybody comprehends its meaning and acts upon it. Normal resistance to disease is directly dependent upon adequate food, normal resistance to disease never comes out of pill boxes. Adequate food is the cradle of normal resistance, the playground of normal immunity, the workshop of good health, and the laboratory of long life."*** *- Dr Charles H. Mayo, MD, surgeon and founder of the Mayo Clinic, USA.*

> ***"It is important to remember that the mere introduction of germs into the living organism does not ensure their multiplication or the production of disease. The condition of the organism itself has much influence on the result. Pasteur has certainly made a hasty generalization in declaring that the only condition which determines an epidemic is the greater or less abundance of germs."*** *- John Shaw Billings*

The Relation of the Microbiome Between Health and Disease

"The idea that the intestinal content can cause a number of physical and psychological ailments is very old. Charles-Joseph Bouchard wrote a book about Autointoxication in 1894, and the Royal Society of Medicine discussed the role of Alimentary Toxaemia at a symposium in 1913.

The human body contains about 10 times more microbes than human cells, and the gut harbours around 1,000 different bacterial species.

Regarding its size and metabolic activity, the "microbe organ" is comparable to the liver. Communication between microbiota and their hosts has been denoted as "inter-kingdom signalling." The Gut Microbial Flora performs several protective, structural, and metabolic functions, and may be incriminated in a number of disorders and diseases.

When I started studying medicine more than 60 years ago, I heard two statements about the gut:

1. The gut has a brain, if not a mind, of its own.

2. Bacteria constitute up to 50% of feces' mass and may be of importance for its texture.

The functional importance of gut microbes was obvious, and today, it is generally accepted that "Man – Microbes - Superorganism," and there is increasing consensus that "Gut - Microbiota - Superorgan."

Absence of the probe coding for E. coli during the first month of life was associated with rapid growth during early life while the presence of Bacteroides spp at 1 month was associated with reduced growth.

Our study shows that the absence of E. coli may be tied to adverse child health outcomes, since its absence was tied to rapid growth which is an early marker of the risk of obesity in later life.

We hypothesize that E. coli may play an important role in very early life, maybe due to cascading events set in motion by the very early colonizers.

Autism Spectrum Disorders (ASDs) are a family of neurodevelopmental conditions of rapidly increasing incidence.

The condition was originally prevalent in approximately 1 in 30 in Korea.

ASD comprises behavioural symptoms, including communication and social impairments, sensory abnormalities, and restricted and repetitive behaviour, often with self-injurious behaviour.

In many children and adults with ASD, co-morbidities include restrictive eating, gastrointestinal symptoms, and seizure disorder. "Common infections, chronic antibiotics, and clostridia colonization contribute to carnitine collapse, Colitis, Convulsions, and Compulsions" impairment of carnitine metabolism from a variety of causes may be central to Autism Pathogenesis and Regression

Of note, impairments in carnitine metabolism are a common feature in ASD and in our PPA rodent model Although the underlining cause of a relative carnitine deficiency reported in ASD remains unclear, we have noted that diverse neurodevelopmental conditions with gastrointestinal symptoms linked to ASD, such as Reye syndrome, valproate toxicity, propionic acidemia, and mitochondrial disorders, often collectively show disruptions in carnitine metabolism. Bacteria should no longer be seen as pure enemies.

Nowadays, there are enough evidences to place microorganisms as key elements in Human Homeostasis. It is known that a balanced human Intestinal Microbiota, constitutes an important protection against the establishment and overgrowth of pathogenic microorganisms, e.g. Clostridium difficile (CD) causing intestinal disorder in the host. The Intestinal Microbiota has a Pivotal Role in the Maintenance of Health of the Human Beings, Especially in the Defence Against Pathogenic Microorganisms." - in "Microbial Ecology in Health & Disease", 2015.

Chronic Bacterial Infections of the Bowel A Major Factor in the Causation of Disease

When the Intestinal Mucosa is well, Bacilli Coli performs normal, and helpful functions; but, when any drastic changes in the contents of the host gut disturbs the intestinal mucosa, this influences the balance, and change the metabolism of B. Coli. Any major alterations towards illness, are mainly initiated by Bad Food Choices, which results in the creation of an environment in the gut, which makes for the bacilli to adapt to its new environment, in order to live. A balanced composition of the gut microbiome is critical to human health. Individuals with disorders such as: Inflammatory Bowel Disease, Autism, Chronic Fatigue Syndrome, and others, have predominantly Gastrointestinal Health Issues, in the causation of their symptoms.

"The work begun on this subject by Dr Bach, and myself, with some help from Dr MacGowan, has been continued during the last year by myself alone. Since the laboratory aspect has been, for the time being, surveyed, the clinical side of the work has become of more importance. **I am glad to be able to report that the investigation may be regarded as completed.**

It has fallen into 3 stages:

1. The confirmation of Dr Bach original researches into Chronic Bacterial Infections of the Bowel as the Prime Cause of Chronic Disease, presenting many and varied symptomatologies. The comparison of these infections with the "Psora of Hahnemann and the suggestion that this latter is really a masterly and prescient conception of Intestinal Toxæmia, and should be regarded (at any rate) in that light."

2. Taking infections of the Gaertner type as much the commonest infections, we concentrated chiefly on these, **and have been able to show that successful treatment by Vaccines and successful treatment by homoeopathic remedies act curatively in identical ways, and that a greatly increased output (excretory probably) of bacilli is the main feature of it.**

3. **I have experimented with potencies of the Gaertner bacillus and have been successful in showing that patients respond to potencies as successfully as they do to Vaccines. This means that a new and most potent remedy has been added to the homoeopathic materia medica,** and this is a result upon which homoeopathists are entitled to congratulate themselves, this new "Nosode." - Dr C. E. Wheeler, MD, in "The British Homoeopathic Journal", 1911.

Internal Vaccination

"What excuse has the homeopathic physician for **desiring a New Form of Vaccination?** This question was put to me by a member of the board of health in Chicago. Let's look at the ordinary method, which is an improvement upon Jenner's barbarous way of smearing the scarified arms of the pure and innocent with the filthy corruption of the diseased bovine. **First, vaccination, although successfully performed, does not always prevent an attack of small-pox, or does not prevent a modified form, as varioloid, which may itself be as dangerous to health and life.** This array of symptoms are so very similar to the diagnostic symptoms of small-pox that they will be easily remembered. The sharp stitching pains in head, chest and back, the offensive and fetid odor, the severe chill and high fever, together with the skin symptoms, complete the picture of the remedy on which we base our claim to a new, scientific, safe and cleanly method of preventing, abridging and curing small-pox. **Variolinum (Variolinum Lymph from smallpox pustule, Dose 6C, 12C, 30C); administered in the homeopathic potencies will not only immunize one from the ravages of small-pox**, but they cannot be successfully vaccinated after taking the remedy, and up to the present time there is no record of persons so protected having taken the dread disease, although repeatedly exposed by nursing cases sick with small-pox. **I have the statements of 40 qualified physicians in good standing in regard to the efficacy of variolinum in the prevention of small-pox, and many of them speak in the highest terms of the method.**

> ***"I have used Internal Vaccination for years and have never had a failure.***
> *Of late years **I refuse to use (External) Vaccine matter, in or under the skin, to avoid being a party to crime**, for, with my experience, **it would be such to introduce a poison that might disfigure a patient for life."** - Dr William W. Lemon, MD, Kansas*

"I Believe the Homeopathic Vaccination Is The Most Rational of Any." *- Dr A. C. Pattee, MD, Greensburg, Kansas*

"I believe Homeopathic Vaccination to be Superior to Ordinary (Medical) Vaccination, and an Effective Preventive of small pox." *- Dr Edward H. Holbrook, MD*

"I Believe the Homeopathic Vaccine is an Effective Preventive of small-pox if not limited to 1 dose of variolinum. I believe It To Be Superior to Ordinary (Medical) Vaccination, and the only rational method." *- Dr H. E. Messenger, MD, Iowa*

"I believe the Homeopathic Vaccine to be an Ideal Preventive of small-pox." *- Dr F. Austin Stowell, MD, Massachusetts*

"I have had an extensive experience with Homeopathic Vaccine, and Always Found it Effective." *- Dr Ernest Clark, MD, Michigan*

"I have used no other but the Homeopathic Vaccine for 30 years and have never been disappointed in the result." *- Dr John C. Nottingham, MD, Michigan*

"I Believe the Homeopathic Vaccine to be as Effective, as and much Less Dangerous Than the Ordinary (Medical) Vaccine." *- Dr Wm. Tyler, MD, Michigan*

"Statistics on Vaccination against Small Pox in the Philippines when the United States took over are instructive. Reports run thus: In 1918, the Army Forced the Vaccination of 3,285,376 natives when No Epidemic Was Brewing, only the sporadic cases of the usual mild nature. Of the Vaccinated persons, 47,369 Came Down with Small Pox, and of these 16,477 Died. In 1919 the experiment was doubled, 7,670.252 natives were Vaccinated. Of these 65,180 cases Came Down with Small Pox, and 44,408 Died. One sees here that the Fatality Rate Increased in the Twice Vaccinated cases." *- Professor Dr William Frederick Koch, MD, in "The Survival Factor In Neoplastic Diseases", 1961.*

Variolinum
(Variolinum Lymph from Smallpox Pustule)

"Dr Fellger reports, giving Variolinum to hundreds of people, and none of them were ever attacked with small-pox.

In one family where the father had confluent small-pox, he gave Variolinum as a prophylactic, and of the others, although not 1 had been vaccinated, not 1 of them took the disease. He reports a case of a broker in Philadelphia who was well pitted from small-pox; when a child he was vaccinated, and he became idiotic in consequence. When 16 years old he had a violent attack of small-pox, after which he recovered his reason. Variolinum is indicated in small-pox where there is not much pain; the patient can even eat fairly well; the skin looks natural between the pustules; the appearance of the eyeball is white and natural; **the mild uncomplicated cases of small-pox are the ones calling for Variolinum."** - Dr Henry Clay ALLEN, MD, in "The Materia Medica of the Nosodes", 1910.

Bowel Nosodes

The first published paper on this concept, was presented by Dr Edward Bach, MD in "The Relation of Vaccine Therapy to Homoeopathy", The British Homoeopathic Journal, April 1920.

Dr John Paterson, MD, a co-worker of Dr Bach, carried on the Clinical Research on Bowel Nosodes after 1929.

Studying the characteristics of Bowel Flora especially their behaviour in both Health and Disease. He conducted research for 20 years, and examined 20,000 stool specimens. **He came to the conclusion that the non-lactose fermenting non-pathogenic bowel flora, undergoes definite changes in the disease condition.**

And observed that after the administration of the suitable Bowel Nosode, the curative process begins. Following this, the non-lactose fermenting bacteria begins to mutate to other groups, and ultimately disappear.

This occurs simultaneously with the disappearance of the symptoms, and the efflorescence of the skin eruptions ultimately clear, and a marked increase in the vitality of the patient.

Bowel Nosodes, Have the Ability to Transform the Outcome of Chronically Ill Patients.

Any clinical discussion dealing with the Micro-Ecology of the Bowel would not be complete without a dedication to Dr Edward Bach, and John Paterson, work.

Their bacteriological investigations, and clinical correlations spanned 40 years, systematically gathering data, and analysing thousands of bacteriological cultures from patients.

The Use of Autologous Vaccines in Chronic Disease

The potential role of autologous vaccines in chronic disease was investigated by Bach (Bacteriologist), and Wheeler (Clinician) who, under joint authorship, published a treatise: "Chronic Diseases - a Working Hypothesis", 1925.

In this paper they selected 500 cases, which had been under observation for at least 6 months, and had received no treatment other than the Autologous Vaccine.

> *"Dr Thomas Dishington conceived the idea of having the autologous vaccines of patients potentised and from a collection of autologous vaccines making a proving." - Dr Bach*

Indications for the use of Intestinal Nosodes in Diseases of Children.

The Bach Polyvalent Nosode was a potency prepared from the intestinal vaccine already in existence.

In association with Thomas Dishington, John Paterson made clinical observations on the effects of the polyvalent nosode at the Scottish Homeopathic Children's Hospital, and by 1927 **they were satisfied that the nosode had clinical value.** Wheeler, Bach and Dishington published a conjoint clinical paper in 1927.

Outfit for Collecting Specimens (Paterson)

1. Hard glass test tube 6 inches x 3/8 inches.
2. Cork (must stand 160 degrees dry heat)
3. Nickel probe with:
   a. Sharpened end - for insertion into cork.
   b. Roughened end - carries cotton wool tip.
4. Label for patient's name, address, etc...
5. Wooden container - for transit.

Bowel swabs are sterilised by dry heat 160°C. for 30 minutes.

Taking Specimens

1. Use clean dry receptacle to receive faeces.
2. Withdraw cork from glass tube.
3. Do not touch metal probe or cotton, wool tip with fingers.
4. Dip point into the faecal material so as to soil cotton
5. Shake off any loose pieces and replace probe into tube.
6. Replace tube, firmly corked, into wooden container ready for transit.

Bulk specimens of faeces are not required, and are unsuitable unless for immediate culture. **Specimens taken by "bowel swab" retain their primary characteristics for long periods without change.**

Secondary change may occur in bulk faeces retained for any length of time.

After presenting their paper at the Quinquenial International Homeopathic Congress of 1927. Paterson visited Bach and learned his bacteriological techniques, prior to establishing a bacteriology laboratory in Glasgow." - in "Systems & Symbiosis - The Bowel Nosodes Reappraised", 2007.

The Rediscovery of Psora (Intestinal Toxaemia); Historical Review of Bach's Nosode Therapy

"The object of this paper is to continue the discussion of the problems presented by Dr Dishington on certain Nosodes prepared from abnormal organisms in the intestinal canal, which have been brought before your notice on different occasions during the past 8 years. I want to describe how these Nosodes have been developed, and evolved, and the processes of thought, reasoning and practice which have placed them in the position they now hold.

3 Main Principles had to be realized before the present effective state of these Nosodes could be obtained:

1. The discovery of the group of bacilli which formed their basis;
2. The value of Hahnemann's laws with regard to repetition in the application of the doses;
3. The fact that the Nosodes would be effective in a potentized state.

About 1912 it was recognized that there were to be found in the intestinal content of both apparently healthy as well as diseased people a class of bacilli which had hitherto been considered unimportant, but which were then proved to be associated with Chronic Disease. These organisms were the various types of non-lactose fermenting bacilli belonging to the great coli-typhoid group, very closely allied to such organisms as the typhoids, dysenteries and paratyphoids, yet not giving rise to acute disease and, in fact, not associated with any specific morbid conditions.

1. Effect of Treatments

Owing to the frequency with which these bacilli were found to be present in such a large percentage of cases when no other abnormal or pathogenic organisms could be isolated, **it was decided to try the use of these in vaccines to see if any benefit could be obtained in cases of chronic disease, and it was found that in**

spite of them being non-pathogenic in the ordinary sense of the word, great benefit could be obtained when they were used as a therapeutic agent in this manner.

It was shown that by such vaccines a mild exacerbation of all the symptoms in a chronic case could be produced, and that in favourable circumstances a definite improvement followed.

2. Period of Dosage

Cases of good results were recorded when patients were so treated, but in those days the percentage of these was comparatively small, owing to the fact that the injections were given much too frequently and a stated intervals, such as 7 or 10 days, with a consequent result of serious over-dosing and interference with the starting of a beneficial reaction.

At the present time several bacteriologists and a considerable number of clinicians can testify to the undoubted connection that exists between these organisms and chronic disorders, and between them and Intestinal Toxaemia with its consequent morbid results, so that there no longer remains the least doubt as regards this relationship.

Some hundreds of practitioners have proved this point from the clinical results that have been obtained by the use of preparations made from these organisms, and the evidence has now grown so large that there is no longer any room for doubt on this point.

A certain amount of laboratory evidence has also been accumulated to prove that there is a relationship between these groups of organisms and disease.

If specimens of a patient are plated out day by day for a considerable period, it will be found that these abnormal organisms are not persistently and constantly present, but that there are negative phases when they are entirely absent, and positive ones when they are present in varying proportions.

Moreover, **the total numbers during the positive phases vary from day to day.**

If we start plating during a negative phase, after a time they begin to appear in the specimens, at first in small numbers, then steadily rising each day until the maximum is reached, when the percentage again falls until they disappear.

Both the maximum percentage and the length of the positive and negative phases may vary very considerably in different subjects, but the interesting point is that the health of the individual, whether in disease or in an apparently normal condition, varies directly with these phases.

Most commonly in cases of chronic illness, the symptoms are worse towards the end of the negative period, and are relieved when there is an output of the abnormal organisms (and generally speaking), the greater the output the more benefit the patient receives. In the apparently healthy, if there are any times when the individual tends to be below the normal standard and is not up to his usual form, these generally occur at the same period of the cycle.

If daily charts of the results of the examinations are kept, it is generally possible to know from these the condition of the patients, and how they are progressing, and they have very often been a useful guide in selecting the correct time for the repetition of doses.

Thus, from a clinical and a laboratory standpoint, there can no longer be any doubt that these groups of Organisms bear a distinct Relationship to Chronic Disease.

The next step **(the discovery that the doses should be given not at stated intervals, but according to the response of the patient),** came as follows:

In the laboratories at University College, in treating cases of Pneumonia with vaccine, it was found that better results were obtained when doses were given according to how the patient reacted to the injection, and that if after a dose the pulse rate and temperature fell, the results were much more satisfactory if no further treatment was given as long as this improvement continued, repetition only being made when the pulse-rate and temperature tended again to rise.

The cures occurred more quickly, and with a higher percentage of successful results, and considerably fewer doses of vaccine were required.

After this had been definitely realized and proved, it logically followed to try the same method **with all types of acute febrile cases, and the same beneficial results were found to occur.** When this had been definitely established, it occurred to the same workers that this law which appeared to apply to all acute diseases might possibly be the same for cases of a chronic type.

So it was tried, and the results again were more than had been anticipated.

In chronic cases a minimum interval of 3 weeks was allowed to elapse before a dose was repeated, because it was found that in some instances benefit did not begin much before that time, and if at the end of 3 weeks improvement had started no further dose was given until every trace of improvement had ceased, and that either the condition had become stationary or there was a tendency to relapse.

On these lines, it was found that the period of amelioration varied in cases from 2 or 3 weeks to intervals as long, in rare examples, as 12 months, and that by refusing to repeat during the time of improvement enormously better results were obtained, and a higher percentage of good results occurred, while of course a much smaller amount of vaccine in each case had to be given.

Such was the success that this method has been persevered with up to the present time.

We Arrived at 2 Conclusions:

1. **This particular group of non-pathogenic non-lactose-fermenting bacilli of the intestine were undoubtedly associated with chronic disease.**

2. **Vaccines made from them were very valuable curative agents, if given according to the laws of Hahnemann,** and studying the response of the patient, and not, as had hitherto been done, at regular intervals.

It was at this stage that, coming to your hospital as your bacteriologist, one was introduced to the Science of Homeopathy.

On reading Hahnemann's "Organon", for the first time, one instantly realized the fact that **the work of the modern Immunity School was merely the rediscovery, by a different method, of facts that had been realized by him a century before**, and in conjunction with some of your physicians homeopathic principles were at once applied to these various groups of bacilli and preparations made from them, potentizing them in the same way as you do your remedies.

It required only a very short time to prove that Nosodes so prepared were of very great therapeutic value, and the further research of the last 8 years, in which many hundreds of cases were treated, has more than justified the earlier hopes.

Today in England, Germany, America, France, Holland and Switzerland, these Nosodes are being used.

Looking at it from the homeopathic point of view, the first important point to be considered is whether these preparations are in accordance with the laws of Hahnemann and whether it is an extension of his work.

Many of us feel, that this is the case, **as the founder of homeopathy in more than one instance uses the morbid product of disease as the basis of a remedy,** and one has little doubt that if he had been in a position to isolate these organs they would have been used. Moreover, **it is still uncertain whether these organisms are the cause, the result or an attempted cure of disease.**

We can do little more at the present time than say that There Is An Association.

3. The Bactenal types in Chronic Disease

It is not at all improbable that these bacilli are a variation of the Bacillus Coli, and the latter, from its universal presence in our modern civilization, not only in men, but in animals, birds, &c, must be considered more or less as a normal inhabitant of the intestine.

Experiments tend to indicate that during great basic fundamental changes in the body the intestinal flora may alter, as if attempting to keep in harmony, for it is not impossible that these groups of bacilli, are the normal B. Coli altered to meet certain needs, **compelled to do so by the altered state of the host**, and that when the bacteria are in this condition they are undoubtedly valuable therapeutic agents when potentized.

Science is tending to show that life is harmony (a state of being in tune), and that disease is discord or a condition when a part of the whole is not vibrating in unison.

In a differentiation of these organisms it is interesting to note, that the sugar lactose is used. Lactose differs from the rest of the sugars in that it is an animal product, the others being vegetable. Recent research indicates that **for a ferment to be able to act upon a substance, the ferment must be able to vibrate in tune with the atomic weight of the substance which has to be fermented.**

Hence, it means that organisms capable of fermenting lactose are able to vibrate in tune with animal tissue, whilst those which are unable to do this are equally unable to be in harmony with substances other than of the vegetable type.

If this theory is able to stand the test of time, it will get us a considerable way towards the understanding of things of fundamental nature, and it means that we have here a method of differentiating organisms which are beneficent from those which are adverse to the human subject.

It is at such a time as they are adverse that we choose to potentize these products and use them as therapeutic agents in the cure of disease.

On all other points, of course, **the Nosodes are identical with Homeopathic Remedies, and their preparation is exactly in accordance with the laws of Materia Medica.**

No one who has studied Intestinal Toxaemia to any extent can possibly fail to see the similarity between this and the basic, fundamental disease described by Hahnemann as Psora (Intestinal Toxaemia).

Dr Gordon of Edinburgh, is going to draw this similarity for you at length at some future date, when he will point out to you the indubitable provings of **the nature of Intestinal Toxaemia which Hahnemann classified under the name of Psora. Hahnemann lays great stress on the impossibility of having more than one disease at the same time.**

This we find in regard to the work on intestinal flora; it is surprising that only in the very rarest cases does one find more than one abnormal type of organism present in one individual, another point of confirmation of the theory that the two states are identical.

In spite of there only being one type of organism present at a particular period, this type may certainly be changed by means of a vaccine (Enema), or Nosode, or remedy administration, indicating that the type of organism depends on the condition of the patient, and that it varies its nature in conformity with the soil in which it has to live.

Generally speaking, in people who have not been treated by homeopathic methods, the organism remains much more constant to its type over a prolonged period of time.

During the past few years Besredka and others have done an enormous amount of work proving the efficacy of giving vaccines by mouth, both as prophylaxis against and also as a cure of disease.

Large numbers of experiments have shown that animals can be rendered immune against live organisms to which they are very susceptible by a few doses of dead emulsion of the same bacteria given by mouth.

Moreover, **tests done among troops have very hopeful results as to the power of the same preparations to protect against infection from typhoid, dysentery, &c, in ordinary life, so that at the present time, both for prophylaxis and treatment, the oral vaccine is becoming an established factor and firms are engaged not only in this country, but on a much greater scale on the Continent, in the manufacture of these preparations in large quantities.**

The suspensions are not potentized in the full sense of the word, but owing to the minuteness of bacteria the total quantity present is very small indeed and probably corresponds to about a 2x or 3x of a Homeopathic remedy; hence they are very closely allied to your potencies.

4. Comparison with Hahnemann

Again, Hahnemann's work is being rediscovered, and a vast number of remedies prepared, though only in low potencies. An attempt is being made by the old school to form a complete Materia Medica, using as their base the various types of organisms, of which of course there are very numerous varieties.

To give you an example, the following is a quotation from the quarterly bulletin:

> *"The vaccine-therapist claims a multiple variety of cases in which the use of vaccines by subcutaneous injection is beneficial.*
> ***One must admit, however, that there are many conditions in which the administration of vaccine by injection is contra-indicated. Acute febrile cases and nervous patients who are hypersensitive may be mentioned as the more important examples.***
> ***It is not generally known that in staphylococcal and streptococcal infections oral vaccines, administered by the mouth in the same way as ordinary medicines, are equally if not more effective than vaccines given by injection.***
> ***Frequent visits for injections are unnecessary as the patient can easily take the oral vaccines at home at the times ordered by the practitioner.***
> *In the treatment of boils and carbuncles some striking successes have been obtained."*

Hahnemann realized well enough comprehended the fact that in Nature might be found an infinite number of remedies to meet all occasions that might arise.

> ***"When thousands of exact, and tireless observers, instead of one as hitherto, have laboured at the discovery of these first elements of a rational Materia Medica, what will it not be possible to effect in the whole extent of the endless kingdom of disease!"*** *- (para 122).*

These Nosodes may be looked upon as great cleaning powers improving the condition of a patient and in certain cases effecting a complete cure, in others so cleaning up the whole state that the patient, who before gave no response, now receives marked benefit from other remedies.

Such has been the success of the practical results of these preparations, that already more allopaths have used them than there are homeopaths on the Register in England; some of them have entirely discarded the syringe and the old hypodermic method of injection for the use of the Nosode, and one can see a distinct danger ahead if this practice spreads too widely without the control of a ruling body, as it should be used only by men who have had distinct training.

The existence of homeopathy in this country depends to an extent on its ability to cure cases where allopathy has failed.

In conclusion, I want to remind you of paragraphs which ended a paper I read to you in April 1920, which are as follows:

> *"Meanwhile it should be realized that science in a totally different manner is confirming the principles of Homeopathy. To Hahnemann should fall all the honour for having anticipated science by more than a century. The attitude today of the medical profession in general is one of regard towards homeopathy; but when, as is shortly certain to happen, it is generally recognized and appreciated that all modern research at the hands of allopaths is rapidly proving and drifting in the direction of Hahnemann's laws, then will homeopathy be acknowledged to be the wonderful science that it is. Let all the members of your Society see to it that they are proud to be amongst the pioneers; let them see to it that they do not err one jot from the fundamental laws of their great founder. For science is proving him in detail — the like remedy, the single dose, the danger of hasty repetition."*

5. 7 Group-Types

We are making every endeavour to replace the bacterial Nosode by means of plants and have, in fact, matched some of them almost exactly; for example, ornithogalum in its vibrations is almost identical with the Morgan group, and we have discovered a seaweed which has almost all the properties of the dysentery type, but there is yet one thing lacking, and that one point keeps us checkmated in the effort to avoid using bacterial Nosodes.

6. Potentising and Polarity

This vital point is polarity: The remedies of the meadow and of Nature, when potentized, are of positive polarity, whereas those which have been associated with disease are of the reverse type, and at the present time it seems that it is this reversed polarity which is so essential in the results which are being obtained by Bacterial Nosodes.

Perhaps at some future date a new form of potentizing may be discovered, which will be capable of reversing the polarity of the simple elements and plants, but until that time comes we have no alternative.

The beneficial effect of these Nosodes is now accepted internationally, and the daily amount of good which is being accomplished in the fight against disease is on an enormous scale, so that it does not seem that this benefit should be withheld from humanity until such time as we may have found a particular method of combating the Psora of Hahnemann by a means which will fit in with the aesthetic mentality of the most fastidious type. Infinitely more important it is that this work should be acknowledged as a continuation of that of Hahnemann, and though not in itself perfect, as leading the way to further discovery.

Its growth and development should be watched and directed by the homeopathic school, and not be allowed to fall into abuse in the hands of men who do not understand the fundamental principles on which it is established." - Dr Edward Bach, MD in "The Rediscovery of Psora", British Homeopathic Journal, January 1929.

The Problem of Chronic Disease

1. Intestinal Tract

"From the earliest records of medical history we find evidence that what we know today as Intestinal Toxaemia was consciously or unconsciously recognized, as evidenced by the drugs and remedies used by the earliest physicians, many of which were laxative and liver stimulating and hence intestinal cleansing in their effect. The alimentary canal must of necessity be of the utmost importance.

Its superficial area is greater than that of the skin surface of our bodies; moreover, it has the power of absorbing from that in which it is bathed — a property not possessed by our external surface in any similar degree; you may sit in a bath of potassium cyanide with no ill-effects, a very small amount of which would be fatal in the stomach; you may wash in water loaded with typhoid or diphtheria or other bacilli without harm, but if a microscopical amount enters the mouth the result may be serious or fatal.

2. Bacteria and Disease

The content of the tract is the fluid in which we live; from which we obtain our fluid and our food; it is to us similar to the water in which the unicellular amoebae moves. It is essential that it should be pure and contain the necessaries of life, and free from any substances which if absorbed may be harmful to the body and against which there is no protective mechanism.

It is surely one of the marvels of Nature that she has been able to cope with such diversity of intestinal content as that with which different races have tested her powers of adaptation.

3. Unnatural Food

Consider the varying diets of different countries; think of the vastly varied composition of the intestinal content as a result; and yet the races, generally speaking, survive. As yet the penalty is not death — merely disease; not extinction — merely degeneration.

4. A Suitable Diet

In all probability the human race was originally intended to live on raw material, the fruits and foods of the tropics, and the human alimentary canal was evolved to deal with such a diet; yet offshoots of that race have migrated to temperate climes and many nations live almost entirely on food which has been cooked, completely altering the intestinal content — and yet the race survives; but humanity does not escape entirely.

It may live, but it suffers; it suffers from a hundred and one diseases, from a lowered standard of health and strength and a loss of physical vitality.

When a race lives on unnatural food, the intestinal content changes chemically, physically and bacteriologically.

All these factors matter, but in people such as those with which we are dealing the bacteriological change matters most.

The chemical and physical characters can be brought somewhat within range of normal by a diet not too far removed from that of civilization by the addition of fruit, salad, &c., and by such means the extreme variance from the normal in both the chemical and physical condition can be remedied even within the limits of diets and select such food as will keep the intestine reasonably clean.

Where there has been an infection of long standing, or where the infection is deeply seated, the bacterial element will resist for at any rate a long time the improvement in the intestinal content, and other methods have to be devised to hasten its removal; hence the greater importance of the bacterial infection as opposed to the abnormal chemical and physical state, owing to the greater difficulty in correction.

Has it ever occurred to you what difference there is between the content of the large intestine of an individual living on raw food and one living on cooked food?

In the latter instance such as is met with in civilized people the content is foul in odour, dark in colour, alkaline in reaction; containing many products of putrefaction such as indol, and the bacterial content is composed of Bacillus Coli, streptococci and spore-bearing organisms.

Contrast this **with the healthy individual who lives on raw material.**

The large intestinal content is of no odour, light in colour, acid in reaction; free from putrefactive products, and the bacterial content consists of the lactic acid bacilli together with some Bacillus coli.

In many cases cure can be accomplished without alteration of even an unnatural diet, where no amount of dieting would give marked benefit, though I do not deny that the combination would be better and more lasting.

5. Vaccine Treatment

They may be the result, but I do maintain that **this group of organisms (lactic acid bacillus) are persistent in patients; that they are associated with chronic disease, and that by the use of preparations made from these bacteria**

themselves we have a most powerful weapon in the fight against chronic disease of all types.

I turn now to the consideration of these organisms, indicators of potential, if not of present, disease whenever they are found, and found they can be in the vast majority of our fellow citizens.

It may be asked why, if they are so deadly, is disease not always-demonstrable?

The answer is that **their immediate virulence is small, and bodies that start with a reasonable measure of health can face their toxins for years without apparent inconvenience.**

But as life advances with all its various stresses the strain of keeping back these organisms, or possibly the conditions which give rise to them, begins to tell, and presently there is a breach in the defences and obvious illness declares itself. The germs of which I speak are bacilli — Gram-negative, of the great coli typhoid group; the important point being that they are incapable of fermenting lactose — a point which distinguishes them from the Bacillus coli itself.

Their number is enormous, it must be understood that each group contains a host of varieties, differing from one another in some minute detail.

Bacteria Types

Non-lactose fermenting bacilli:

1. Dysentery
2. Gaertner
3. Faecalis alkaligenes
4. Morgan
5. Proteus
6. Coli mutabile

They are grouped according to their powers of fermenting certain sugars, and only a few sugars have been used so as to keep the number of groups small.

If an autogenous vaccine is used, the exact definition of the organism is of no importance for treatment, and the polyvalent throws a very wide net and contains many representatives of each class. **These, are the bacilli which for the most part are considered harmless, but which are really the indication and, if properly used, a means of cure of chronic disease.**

The clinical evidence of the power to cure is too well established to admit of doubt, and will be referred to presently, but the laboratory is accumulating evidence of a non-clinical nature which demonstrates **the connection between these organisms and disease.** By daily examinations of the faces of a patient it is possible, by recording the percentage of organisms present in the form of a chart, to show the relation between the condition of the patient and the percentage found. The ratio between the abnormal nonlactose-fermenting organisms and the number of Bacillus coli present.

Generally speaking, it is considered normal for coli alone to be present, but these abnormal bacilli may be found in anything from 1% to 100% of the total colonies obtained.

From the alteration in percentage during treatment it can be ascertained to a certain degree how well a patient is likely to respond.

As a general rule the organisms found remain true to type for any given case.

That is to say, Gaertner does not seem to change to a Morgan or a proteus.

If a patient's faeces are plated daily and the percentage of abnormal bacilli charted, it will be found that these are not uniformly present, but that they occur in cycles. Perhaps for a period the specimens are free, and then the organisms appear, rapidly rise in numbers, remain at the highest point for some time, and then diminish until they disappear.

The intervals of freedom from them, the periods of the positive phase of their presence, the highest percentage of them reached, vary in different cases, but the clinical condition of the patient bears a certain relationship to the curve of organisms present in the specimens.

More than one type of curve exists; there is a definite relation between clinical conditions and bacterial percentage, and as an example of this the most brilliant result after vaccine treatment occurs when there is a short negative phase followed by a higher and more prolonged positive phase than that which is the patient's usual routine. Those cases where there is little or no alteration from their usual type of course do not do so well. It is extraordinary how rapidly the bacterial content may alter. Perhaps after weeks of negative plating, within 36 hours the specimens may contain as high as 100% of these abnormal bacilli.

What happens to produce this result; whether it is a changed condition of the intestinal content or of the patient himself that causes this change gives room for much research, and when that problem is solved we shall have made a great advance towards the knowledge of the cause of disease. It is already established that the percentage of these bacilli in the specimens bears a direct relation towards the condition of the patient in his varying phases from a clinical point of view.

Another curious feature is the stability of a particular type of bacillus in a given subject. Over several years, no matter how often examinations be made and whatever the condition or disease of the patient, the particular type remains true.

It is rare to find more than one type in the same case, although this may happen in a small percentage. There are certain symptoms which occur more frequently with one type than with another, and it is not improbable, when further observations are made, that it will be found there is a close relationship between certain disease symptoms and definite types of these organisms.

Whether these organisms be the cause or result, they are - associated with chronic disease, and an enormous amount of benefit can be obtained by the use of vaccine made from them. This has certainly been proven conclusively during the last 12 years.

I have previously referred to the fact that the clinical evidence of the value of this method of treatment is sufficient to leave no room for doubt.

Hundreds and thousands of patients have been treated on these lines, by a considerable number of practitioners; by both hypodermic and potentized preparations; 80% of those patients have shown improvement (to place it at a moderate figure), some only a little benefit, the majority very definite relief, a good many brilliant results, and about 10% practically miracles.

Years of experience and experiments, the observation of thousands of cases, that I place this proposition; the co-operation and observation and experience of practitioners throughout the British Isles, who support this evidence.

Patients may be treated with vaccines of these organisms given by hypodermic injection, as has been done now for a considerable number of years.

> ***"Hahnemann shows that most chronic diseases, originating in a common source and being related amongst each other, a special class of remedies designated by Hahnemann "anti-psorics", should be used in the treatment of those diseases. This common source of most chronic diseases, according to Hahnemann, is Psora."*** *- in "The Chronic Diseases: Their Specific Nature and Their Homeopathic Treatment", 1889.*

The point I wish to stress is that as good, and I and others believe better, results are obtained by potentized preparations of killed organisms.

These have been in use for about 7 years, and extensively for the last 2 years, by homeopaths and allopaths alike, **and there are allopaths who have discarded the syringe for their use.**

These Potencies may be of 2 Varieties:

1. Autogenous
2. Polyvalent

An Autogenous preparation means that the bacillus of a particular patient is potentized and used for that patient.

A Polyvalent implies collecting organisms from some hundreds of patients, mixing together and potentizing the whole.

It is this preparation which has been submitted to you on previous occasions, as a Nosode worthy of your consideration.

The autogenous is of use only for the subject from whom it was prepared, or possibly any patient having an identical infection. The polyvalent, on the other hand, is prepared with the object of covering as many cases as possible.

It is hoped that by various tests it will be possible to ascertain whether the polyvalent, autogenous, or even a mixture of 2 or 3 strains, will be the perfect form of administration for any particular patient.

It is necessary, to give you the exact technical details of preparation so that any competent bacteriologist can prepare these potencies.

6. Preparing Nosodes

I. Autogenous Nosode:

Feces are plated on McConkey's ribipel agar, incubated 16 hours.

When this is done organisms grow as red, or white colonies.

If they ferment lactose with the production of acid, that acid reacts on the neutral red in the medium to give a red colony; if they be non-lactose fermenters no acid is formed, no action on the neutral red and the colonies grow white. Hence the only interest is in those colonies which after incubation are white in colour. Cultures made from white colonies, rejecting the coloured, on agar slopes, incubated 15 hours and sugar reactions determined to group the organisms.

One culture washed up in 2 cc distilled water Sealed and killed at 60° C. for 30 minutes.

Triturated with milk sugar, the whole in g or the whole in 99 grm of milk sugar.

This makes 1st decimal or 1st centesimal potency, according to the amount of milk sugar used. Further potencies are made by trituration up to the 6th c or the 12th x, and thereafter with the usual fluid mediums. Special care is necessary in sterilizing all apparatus used to free them of a previous potency. Dry heat of at least 140° C. for 15 minutes is probably more effective than steam or moist heat.

II. Polyvalent Nosode:

The Polyvalent Nosode is obtained by collecting cultures from several hundreds of cases; by adding them as they are obtained to a sterile bottle, and when a sufficient number have been reached 1 cc of the whole well mixed and shaken is potentized as above.

It is a link between the allopathic and homeopathic schools; discovered by a member of the allopathic vanguard, it is found to be in line with homeopathic principles.

I submit this Nosode to you as a remedy worth including in your pharmacopoeia; useful especially as a basic remedy in cases which fail to respond to ordinary drugs, or where no remedy is especially indicated, though its use need not be restricted to these cases.

The Nosode I submit to you is being tried in America and Germany, and in this country it is being used by a considerably larger number of allopaths than homeopaths. Some of the former, **who for years have been getting good results with the hypodermic variety of the vaccine, have completely discarded the syringe in favour of the potency.**

I believe that the proper use of this nosode is to regard it as a basic remedy, and I have no doubt that the most brilliant results will be obtained when it is followed by homeopathic treatment, matching the symptoms with the appropriate remedy.

The nosode is capable of removing a greater or less amount of a really profound basic trouble. Hence, brilliant though the results are which have been obtained by allopaths, in your hands they should be even better.

In the case of giving vaccines hypodermically it is almost essential to have an autogenous to get the best results; here **95% of the patients do much better on their own vaccine,** and only about 5% respond more definitely to the polyvalent; such is the success of the polyvalent that I **am inclined to think in some cases it is better than, and in a large majority of cases equally as good, as the Autogenous, though there probably will be always certain cases that will only respond to a personal nosode prepared from their own organisms.**

The nosode, the remedy prepared from the material of disease, antedated bacteriology and the vaccine; but the relation of the latter to the former is obvious.

To your school, pioneers in the clinical use of disease to cure disease, **I offer a remedy which is, I believe, potent against the deepest of all diseases, that Chronic Toxemia which Hahnemann divined and named.**

I am confirming and extending his work." - Dr Edward Bach, MD in "International Homeopathic Congress", London, 1927.

The Role of Bowel Flora in Chronic Disease

"The result of 20 years observations as physician and bacteriologist upon the role played by the non-lactose fermenting bacilli of the bowel in chronic disease. In 1880 the bacteriologist Eberth succeeded in isolating and identifying the B. typhosus - a non-lactose fermenting gram negative bacillus - and **it was easy to provide the experimental evidence of the role this played when found in the intestinal tract.**

From that date onwards other organisms were noted as present in the intestinal tract, and their isolation and identification as members of the coli-typhoid group easy to establish, but as they failed to give any experimental evidence of pathogenesis, they were dismissed as having no significance in the bowel flora.

The publication of the work by Bach and Wheeler, in "Chronic Disease, A Working Hypothesis", 1925. Their conclusions were in opposition to the then accepted theories, as the following quotation shows.

> ***"A point which we particularly wish to stress is that a non-lactose fermenting gram negative bacillus in the faeces, whether it falls into a known variety or not, may be the cause of Toxaemia even though it may not give rise to obvious lesions. In fact the great majority never do, nor can, cause locally anything more than at the most, a little mucous colitis or some affection of that nature. Vaccine therapy principles warrant the belief that if disease symptoms disappear or are much ameliorated after the use of a vaccine made from a particular organism, then that organism counts at least for something in the production of the disease symptoms."***

Acting on that assumption a polyvalent vaccine of all types of non-lactose bacilli from the bowel was prepared for hypodermic use, and the results of treatment of 500 cases of a variety of chronic diseases published.

The results are rather striking:

Swift and striking................15%
Gradual and excellent 65%
Some definite effect.............15%
Unaffected................................5%

Our conclusions are based on 10 years work, Bacteriological and Clinical.

Within the Homeopathic School the oral vaccine displaced the hypodermic preparation, and the potentized vaccine (nosode) the bacterial emulsion.

1. Observing the clinical symptoms present when a particular organism was identified in the bowel.

2. **Observing the clinical symptoms which were ameliorated or disappeared after the giving of a particular bowel nosode**, it was possible even at that time (after some 8 years work) to give some tentative indications of the pathogenesis of certain types.

After 20 years work, combining clinical and laboratory observations, I can with confidence record the pathogenesis of each of the named types on that list.

After 10 years work Bach and Wheeler invited as wide a testing as possible of both their conclusions and practice.

After 20 years of clinical and bacteriological research I hereby confirm their hypothesis, that the non-lactose fermenting gram negative organisms of the intestinal tract do have a role in the causation of chronic disease, and that in the bowel nosodes I find myself possessed of a new and powerful weapon for treatment.

The Morgan (Bach) group — which includes all the sub-types - **has action mainly on the vegetative system of the body: on the mucous membrane of the whole alimentary tract from the mouth to the anus, and the prolongation of the tract into the liver, it also acts on the mucous membrane of the whole of the genito-urinary tract.**

While internally it acts on mucous membrane, it has also marked action on the skin.

From the list you will notice that the main Morgan group has been subdivided into (A) Morgan (pure) and (B) Morgan-Gaertner.

Is there any clinical significance of this sub-typing?

In the laboratory technique introduced by Dr Bach the organism was named according to the sugar reaction at the end of 18 hours incubation.

An organism which produced acid and gas in Glucose only, irrespective of what happened thereafter, would be named Bacillus Morgan. In my laboratory observations I noted that some types thus named B. Morgan (Bach) remained true to the usual maximum period of incubation of 72 hours, and to this I gave the name B. Morgan (pure). In other cases after the initial 18 hour period a change was noted, so that at the maximal period of 72 hours the sugar reaction was that of B. Gaertner, and to this type I gave the name Bacillus Morgan-Gaertner.

All the members of the Morgan group have selective action on the liver, but there is a difference in the degree of action of the sub-types.

B. Morgan-Gaertner has been found in the stool more often in the case of acute inflammation of the gall-bladder, acute cholecystitis, and B. Morgan (pure) is usually associated with the more chronic phase of gallstones.

The more acute action of Morgan-Gaertner is also noted throughout the genito-urinary tract, but its main action is upon the kidney with the formation of renal calculus. B. Morgan has outstanding action upon the skin.

It is known that the bowel mucosa has its peculiar enzymes which act as a barrier to the bacterial invasion of the body proper.

It is reasonable to presume that the chain of reactions set up may affect these enzymes, and thus finally affect the Bowel Flora. On this hypothesis each of the bowel nosodes - products of bacterial cell activity - can be assumed to be a very complex structure of the nature of a mosaic with each of - the remedies in each of the particular groups forming the units which make the pattern.

It matters not if they are simple or compound, animal or vegetable each has a part in the completed structure.

Homeopathic potencies are capable of altering the flora of the bowel.

Metchnikoff advanced his sour milk theory - that the B. Bulgaricus found in sour milk could alter the flora of the bowel, and by supplanting harmful organisms promote good health and long life.

“A Treatise on the Transformation of the Intestinal Flora with special Reference to the Implantation of B. Acidophilus”, Yale University, 1921.

The work was conducted at the Sheffield Scientific School of Yale University.

The Conclusions are as follows:

1. B Acidophilus given in whey broth cultures in sufficient amounts (300 c.c.) can alter the bowel flora by suppressing or supplanting other organisms.

2. Lactose (sugar of milk) when given in sufficient quantities, 300 to 500 grams per day, can also change the bowel flora with the appearance and preponderance of B. Acidophilus.

3. Combining the administration of B. Acidophilus with lactose, comparatively small amounts were required to maintain the change in the bowel flora. (150 grams lactose and 150 c.c. whey broth)

> ***"The simple character of the new flora persists, so long as one or other diet or preparation is continued, but reverts gradually to the normal or usual mixed type within 5 or 6 days after a return to the basal diet."***

Keeping in mind the point made earlier in this paper - **that bacteria are peculiarly adaptable to environment, and indeed must train themselves to utilize whatever media is available in order to survive**, it is not difficult to explain the change of bowel flora under such a set of experiments.

If one made up a mixed culture of bacteria containing but a small proportion of B Acidophilus and inoculated this into whey broth to which lactose had been added, there would be an immediate reaction.

Subsequent plating would show that there was an overwhelming preponderance of B. Acidophilus even to the suppression of all other types.

In these experiments the conclusions reached must be my answer to the diet critic - that in a matter of days after the return to the normal basic diet, the bowel flora returned to what it was before.

The change was due entirely to the supply of sufficient pabulum.

The question arises as to the type of bowel flora present before the change over.

Whence cometh the non-lactose bacilli?

Were they present before, but in such small amounts as to escape attention?

I think the control examination made over considerable periods negatives this suggestion in numerous cases, and the general opinion would be **to accept the fact that the change is an example of Mutation of Bacteria.**

The role played by the B. Coli is generally considered to be a normal inhabitant of the large bowel, is little understood or even taken notice of.

From the moment the infant is put on to other than mother's milk, coliform organisms appear in the stool and persist throughout life in great numbers.

The Bowel Flora forms a Physiological Unit, and is not a miscellaneous collection of germs. In my working hypothesis I accept the fact that organisms which live together on the same media (in this case the intestinal tract), are either in symbiotic or anti-biotic relationship to one another, and if one can isolate a single type of organism and from the culture prepare and administer the potentized remedy (nosode), it may be possible to disturb the balance and set up a chain of reactions in the manner I have already described.

The bacteriologist must now accept the evidence of the physician that these organisms are pathogenic it means "originating disease", but I would modify this as meaning "associated with disease". I visualize the germs as being present, but not necessarily causing the symptom complex; the disease. Such an Interpretation is more Scientifically Correct.

Discussion

Dr Briggs - **"I must thank Dr Paterson for a series of interesting papers which has to a great extent influenced, my life during the past 10 to 20 years.**

I was an orthodox bacteriologist of the 1908 school and in those days we were all taught that the germ caused the disease and that was such a plausible explanation of disease that it was eagerly seized upon. We add the germ to the subject and we get disease. Fortunately we had a few deeper thinking people in the profession who saw beyond what seemed to be a really very plausible theory. Even today we think of the B. Typhus as the cause of typhoid. But, is it?

We know that so many people take it and never have the disease.

We had some some interesting results. For instance, I had one stool which was completely negative, i.e. showing no non-lactose bacteria: 1 week later it showed 100% non-lactose organisms and 3 days later it was back again completely negative. Well, we want to know the reason for that.

I looked up the clinical record in this case and found that the patient had not received any treatment in hospital but she had had a long string of remedies given at various intervals, from 24 hours, to 2 or 3 weeks, from the medical attendant before she had been admitted to hospital."

Dr McCrae - **"When I get a list of drugs referring to a particular subject, I always enjoy their examination from the point of view of their Electro-Physical relationships.**

In this work of Dr Paterson's therefore he has struck a law of relationship in the Bacteriological sphere which corresponds in a striking manner to the law of Electro-Physical relationships.

Dr Paterson has added evidence of great value to our annals of homeopathic research.

His meticulous work has pointed to a very remarkable laboratory technique which shows the influence of potency energy on the human body before any other customary laboratory investigation can do so."

Dr Julian - **"Again, it seems to me even although you can show in a diseased case that there is variation in the bowel flora, the explanation of the disease does not lie so much in the changes of the flora as in the conditions of the bowel which made those changes in the flora possible.**

That is to say, the patient is not ill because he has pathogenic organisms, but the pathogenic organisms are there because he is ill!"

Dr Brown - **"The question of food being able to alter the nature of the bowel flora. I think everyone will realize that, but there is one food which is particularly evident in that respect and that is sugar.**

Before Hahnemann's time, the consumption of sugar in Europe was comparatively low and the health of the people in general, apart, from specific infective diseases, was comparatively good.

With the introduction of sugar to the diet at the time of the Napoleonic Wars, a large group of diseases began to appear.

In 1819 in Britain, the consumption of sugar was about 18 lbs. per head per annum. In 1926 it was 106 lbs. per head per annum.

Appendicitis is said to have appeared as a disease at a time when the sugar consumption was about 60 lbs. per head per annum, about 1880.

If we consider the bowel flora associated with cholera and other intestinal disorders, it is of considerable importance to realize that when the sugar consumption reaches 3-4 ozs. per diem per person, the intestinal reaction is converted from normal alkalinity to intermittent or constant acidity.

An intestinal reaction which is perpetually acid must have an effect on the intestinal flora, as Normally the Intestinal Contents Should be Alkaline.

When sugar consumption reached 60 lbs. Per head per annum, appendicitis appeared as a disease and it is about that figure, roughly 3 ozs. per diem, that we get this change from alkalinity to acidity.

In connection with diet, it is of interest to take patients who have had the operation of appendicostomy performed. One can, by varying the sugar consumption , have a varying reaction. In our struggle to overcome the ravages of chronic disorders, we lose sight of certain foods in our bodies. In particular we lose sight of the fact that sugar has only recently become a part of our diet. The primitive races, who consume practically no sugar, are almost entirely free from the chronic disorders which affect the civilized races."

Dr Lees - **"I was interested in the cases reported by Dr Hamilton.**

All the cases had Mental Symptoms; but the other symptoms of each case were either Digestive or Skin.

This suggests that there may he an alternation of Skin and Digestive symptoms similar to the alternation we find with Asthma and Skin.

When we consider the individual (and we should be eternally grateful to Hahnemann that he always dealt with the sick individuals and not with the diseases), we find 2 quite different parts; the Head, and the Metabolic parts.

They stand opposite one another even in the it anatomical structure, and one part has a counteraction on the other if a worrying excitable person develops a duodenal ulcer, etc. This interaction should be held in mind.

Dr Brown and Dr Wilson both spoke about the effect of taking sugar.

Dr Brown emphasizing the difference of the bowel flora in primitive races and civilized peoples because the latter consumed so much sugar.

I think we must take into consideration here the quite different Mental Attitudes of these people as the nervous tension and pace of living in civilized countries affects the bowel flora."

Dr Boyd: **"I do think out of this discussion there has come one very clear issue put by Dr Julian and by some other speakers. I think the point at issue which I should just like to sum up is that there has been put forward the view that these organisms are pathogenic. At the same time there has been put forward the point of view that organisms cannot cause disease, i.e. that they cannot determine the pathogenesis. There is also the point by Dr Julian that the organisms may be accompaniments.**

They do not cause disease but they are present when the patient is ill. The other point, a practical one, is an opinion based on a great number of cases by the emanometer. I am quite convinced that the general nosodes as supplied, i.e. the Morgan Co., Morgan (pure) and so on which have been produced, I believe, by collecting a large number of cultures of the particular type and then by the potency eventually being made from these, are of much greater value than what I would call auto-nosodes. I have noticed repeatedly that if a culture is made when a patient is under the influence of a remedy, the auto-nosode has no permanent or continuous effect at all and I am almost dogmatic on it as I have come across it in so many cases. If the patient is under the influence of a remedy I find that the dose of the auto-nosode is merely antidotal. It is far better to get a culture potentized, give it, wait so long and then a second culture and tincture from it is much more likely to give effect. The auto-nosodes vary from day to day according to the state of the patient and therefore potencies from them are not apt to be of such general use as the general nosodes"." - Dr John Paterson, MD, in "The Role of Bowel Flora in Chronic Disease", The British Homeopathic Journal, January 1949.

> ***"Everyone now says that border-line sciences are important. Chemical reactions have long been studied in isolation: in a cell these reactions occur in a co-ordinated manner, and in particular the autosynthetic process assumes a dominant role.***
> ***The question whether any of the modes of thought and work to which the chemist is accustomed in dealing with inanimate systems help in understanding the behaviour of the living cell is one which must be asked unless the traditional method of proceeding from the known to the unknown is abandoned.***
> ***If the answer is negative Nature will not hesitate to give it, but it is better to be put in one's place by her than by any other authority."*** *- Sir Cyril Norman Hinshelwood, 1956 Nobel Prize in chemistry, in "The Chemical Kinetics of the Bacterial Cell", 1952.*

Chapter 11

The Gut-Brain Axis

"There is no doubt that research in the last decade has established a link between Gut Microbiota and Brain Function. There is substantial buzz about the bidirectional nature of these seemingly infinite relationships.

We have learned several things:

1. Gut Microbiota are important to healthy metabolism and brain function.
2. Gut-Brain communication pathways include neural connections.
3. Gut Microbiota are significant during early development and can influence the wiring of stress circuitry in the Brain.
4. Probiotics (good bacteria), have been shown in animal and human studies to have a beneficial impact on mood symptoms.

Microbiota (an important modulator of health), must be considered as one component of a complex, multifaceted communication system needed to establish a healthy balance for brain development and function.

Thus, Gut Microbiota are important to healthy brain development.

In particular, Microbiota may influence the development of Brain regions involved in our response to stress, and control stress-related conditions such as: Anxiety and Depression.

Having established connections among Gut Bacteria, the Brain, and Behaviour, it is intriguing to consider the ways that microbiota may communicate with the Brain.

Classical thinking tells us that there are neural connections from the body to the Brain through Peripheral Nerves, and, in particular, the Vagus Nerve, which provides information from the Gut to the Brain.

Commensal Bacteria play an important role in maintaining the integrity of the Intestinal Tract, and in situations of stress or disease, increased intestinal permeability can contribute to increased inflammation.

Increased Intestinal Permeability (Leaky Gut), can lead to translocation of bacteria out of the lumen of the GI tract across the intestinal layer.

This is an additional pathway that microbiota, and pathogenic bacteria use to communicate with the brain via the Immune System or through activation of local neurons in the Enteric Nervous System (ENS).

The Enteric Nervous System is a part of the Autonomic Nervous System that is housed in the Gut, and is responsible for gut motility and other normal gut functions. It is a vast network of Neurons that are the first points of contact for Microbiota in the Intestinal Lumen and are an important component of the Brain-Gut Axis." - in "Gut Feelings: Bacteria and the Brain", Cerebrum, 2013.

The Link Between Gut Bacteria and Neurodegenerative Diseases

“The Intestinal Microbiota influence neurodevelopment, modulate behavior, and contribute to neurological disorders.

Parkinson’s Disease (PD) represents a growing health concern.

Antibiotic treatment ameliorates, while microbial re-colonization promotes, pathophysiology in adult animals, suggesting that postnatal signaling between the gut and the brain modulates disease.

Oral administration of specific microbial metabolites to germ-free mice promotes neuroinflammation and motor symptoms.

Colonization of mice with microbiota from Parkinson’s Disease-affected patients enhances physical impairments compared to microbiota transplants from healthy human donors.

These findings reveal that gut bacteria regulate movement disorders in mice, and suggest that alterations in the human microbiome represent a risk factor for Parkinson’s Disease.

The observation that gut bacteria from Parkinson’s Disease patients compared to healthy controls enhance motor deficits in a mouse model provides evidence for a functional contribution by the microbiota to synuclienopathies.

We provide evidence that the gut microbiota are required for postnatal events that promote hallmark motor deficits in an animal model.

What Causes Dysbiosis in Parkinson’s Disease?

Physiological functions in affected individuals, such as altered intestinal absorption, reduced gastric motility, or dietary habits, represent factors that may change the microbiome.

Epidemiological evidence has linked specific pesticide exposure to the incidence of Parkinson’s Disease**, with some pesticides known to impact microbiome configuration.**

Metabolites produced by a deranged microbiota may enter the circulation (or even the brain), and impact neurological function.

Certain neurologic conditions that have classically been studied as disorders of the brain may also have etiologies in the gut.” - in “Gut Microbiota Regulate Motor Deficits and Neuroinflammation in a Model of Parkinson’s Disease”, Cell, 1 December 2016.

"In order to maintain health and ward off disease, people needed to carefully monitor their intake of food, habits of sleeping and waking, physical exercise, frequency of "excretion" (urination and defecation), access to clean air, and regulation of sexual activities and "passions" (emotions).

The stomach was accorded a primacy among the bodily organs reflective of its importance in sustaining life as the seat of digestion. In this humoral paradigm, the process of digestion was seen as the direct instigator of sleep.

Eighteenth-century neurologist Robert Whytt (1714–66) developed the concept of nervous "sympathy" to explain how the organs of the body interacted with each other, thereby creating a mechanism for a brain-gut connection in Neurology.

Digestion and the Causation of Sleeplessness

The role of the gut as an instigator of sleep loss has a long history.

In the 18th century, William Cullen observed:

> ***"Persons who labour under a weakness of the stomach, as I have done for a great number of years past, knowing that certain foods, without their being conscious of it, prevent sleeping."*** *- in "The Croonian Lectures on Functional Derangements of the Liver," Lancet, 1874.*

In the early 19th century, Sir Henry Holland expounded:

> ***"No rules are more important than such as apply to the relation between digestion and sleep."*** *- in "Medical Notes and Reflections", 1840.*

By the 1870s, the eminent Sir Dyce Duckworth was confident in declaring:

> ***"Dyspepsia is not only one of the commonest, but also one of the least recognised, of the causes of loss of sleep; and amongst reasons for this statement are the facts that the symptoms of digestive disturbance are sometimes, indeed frequently, not appreciable, or not at all prominent, at the time of retiring to rest; and also, that the diurnal digestion may be in a comparatively vigorous state. Most persons are familiar with acute dyspepsia as occurring in the night, and supervening upon errors of diet; and in such cases a disturbed sleep is rudely broken by an attack of cardialgia or acid vomiting."*** *- in "Observations on the Causes and Treatment of Certain Forms of Sleeplessness", 1874.*

Ian Miller has argued that:

> ***"They confirmed the long-standing view (which stretched back to Hippocratic-Galenic medicine) that there was an intimate relation between the stomach and the psyche that was far from being laid to rest by mechanical models of the stomach or pathological systems that emphasised brain and nerves.***
> ***The ongoing linking of poor gastric health with the mind, supported by Abernethy and others. Coleridge recorded in his diary that his chronic stomach disorder had affected his nervous powers. Being unable to call Coleridge's attention to its pain while asleep, Coleridge's stomach had offered a stark reminder of its turmoil by producing a horrifyingly vivid dream via the nervous system."*** *- in "Bellies, Bowels and Entrails in the Eighteenth Century", 2018.*

But how exactly was indigestion believed to be acting to cause sleeplessness?

And how might this fit in with physiological theories about circulation, nerves, and sleep causation?

While searching for one coherent explanation in the cacophony of medical writings on sleeplessness would be an impossible task, sleeplessness and indigestion often occupied the same conceptual space.

To that end, English physician Joseph Mortimer Granville's formulation of "Visceral Consciousness" illuminating the connections between the brain and gut in paradigms of sleep loss.

Granville argued one of the most common physical causes of sleeplessness was what he described as "visceral consciousness" — or "mental impressions arising in connection with one of more of the visceral organs," often in the form of pain, bloating, flatulence, or other discomfort.

These messages of pain would then be relayed to the brain via the nervous system. In short, it was often the body, not the brain, that was the problem in the case of sleep loss.

Granville's conception of the brain-gut connection emerged from a longer history of thinking around "gastric sympathy."

Like medical writers earlier in the century, Granville perceived the connection of physically separate organs in the body, particularly the brain and gut, in terms of a "nervous sympathy": the spinal cord relayed messages from the viscera to the brain, which could prompt sleep disturbance or even unwelcome dreams depending on the state of the digestion.

Granville believed that the viscera would "awake" before or even independently of the brain — meaning that abdominal pains or dyspepsia, communicated via the sympathetic nervous system, could lead to sleepless nights without the patient even being consciously aware of the source of the problem. Like many of his contemporaries, Granville was convinced that the digestive system could block patients from sleeping either as a result of this "sensibility" or because of the negative effects of fermentation.

He observed:

> ***"The presence of undigested food in the stomach is a common cause of sleeplessness. There is no greater error than to suppose that general, and really refreshing, sleep can be obtained while the digestive organs are busy with food."*** *- Granville in "Sleep and Sleeplessness", 1879.*

The result of trying to sleep while the digestive organs were busy at work was unusual dreams, headaches, pain, irritation, and flatulence — all of which were calculated to disrupt repose.

Overloading of the digestive system was sure to "set up irritation," which, passed along the nervous system, disturbed sleep.

Granville advised his readers to be mindful of leaving sufficient time between dinner and bed so that digestion could be completed before taking their rest—avoiding disruptive fermentation of food left over in the stomach.

This meant that people needed to know how long different foods might take to leave the stomach, for which he turned to the work of the "father of gastric physiology," American Army surgeon William Beaumont (1785–1853).

Eating the wrong foods at the wrong time often resulted in one of the most common, and potentially most embarrassing, causes of sleeplessness—flatulence. Constipation was also commonly linked with sleeplessness.

The "torpid" bowel interacted with the wakeful mind in numerous ways.

First, frazzled nerves meant that the nervous system was no longer able to enliven the digestion and leading to an eventual stasis of the bowels.

Second, the distention and irritability of the bowels might act more directly by disrupting the circulation.

Finally, Constipation might itself instigate sleeplessness through a process of "Auto-Intoxication," whereby accumulated fecal material would begin to rot and its poisonous emissions were absorbed into the blood stream.

In "Acute Toxemia," this overloaded blood would in turn affect the proper functioning of the brain and hinder sleep.

Brown appealed to his readers that the common experience of headache as a result of Constipation, was proof enough of this intimate connection between congested bowels and the brain.

Indeed, constipation might act to set up the dyspepsia that so many authors linked with sleep loss by contributing to congestion in the liver.

Brown recommended practitioners to begin their attack on sleep loss at the liver in order to purge the digestive system.

Other suggestions included regular enemas and live cultures such as those found in yoghurt to counter "intestinal stagnation."

Diet and Hygiene in the Treatment of Sleeplessness

While the digestive system was often perceived as the cause of sleep loss, it was also through the bowels that a cure could be found.

By the early 19th century, Sir Henry Holland asserted that:

> ***"A great source of inequality and disturbance in sleep is doubtless to be found in the state of the viscera."*** *- in "Medical Notes and Reflections", 1840.*

To tackle sleeplessness, Holland recommended **wholesome diet and "supper at bedtime" in order to remove "irritation" of the viscera, and hence the undue excitement of the nervous system."** - in "Visceral Consciousness; The Gut-Brain Axis in Victorian Sleep and Sleeplessness in Britain and America, 1850-1914", Bulletin of the History of Medicine, 2021.

The Influence of the Microbiome Upon Health And Disease

"The effect of food choices (nutrition), on the commensal flora, and its influence upon the organs and tissues.

The importance, and role of commensal flora in the treatment and prevention of disease.

1. **Mouth**
2. **Skin**
3. **Respiratory Tract**
4. **Gastro-Intestinal Tract**
5. **Genito-Urinary Tract**

When he presented his reflections on "Neurasthenia, or Nervous Exhaustion" for the first time, in a lecture to the New York Medical Journal Association in 1869, he opened by stating that Neurasthenia, literally meaning 'want of strength in the nerve', was one of the most common causes and effects of disease at the time.

He compared the condition to anemia, arguing that:

> ***"Anæmia is to the vascular system what Neurasthenia is to the nervous.***
> ***The one means want of blood; the other, want of Nervous Force."***

This "Want of Nervous Force" and Exhaustion of the Nervous System could, according to Beard, lead to the development of a vast range of symptoms, including:

1. **Tiredness.**
2. **Headaches.**
3. **Palpitations.**
4. **Anxiety.**
5. **Depression.**
6. **Sexual Impotence.**

The general clinical examinations did, however, rarely reveal any pathological findings. Since the late 1980's Neurasthenia has also figured in debates, where it has been suggested as a historical forerunner of several contested diagnoses of our time, most notably: Chronic Fatigue Syndrome (also called Myalgic Encephalomyelitis / ME).

Neurasthenia in its heyday, in many cases Was Perceived as a Disorder which Was Closely Associated With The Gut.

Several physicians reported that Gastrointestinal Complaints Constituted a Predominant part of the clinical picture in many Neurasthenic patients, and some of these physicians felt the need to define a sub-entity of the wide neurasthenia diagnosis.

Nerve-gut interactions in neurasthenia contain several elements that may be seen as important historical precedents for the current debate about the Brain–Gut Axis in functional gastrointestinal disorders.

Digestive symptoms played a part already in the earliest writings on American Neurasthenia; George Beard as well as Edwin van Deusen mentioned Dyspepsia as one of the most common complaints in their first papers on this condition.

Beard's attention towards this part of the neurasthenic picture grew throughout the following years, and in the text that came to be the first standard work on Neurasthenia, "A Practical Treatise On Nervous Exhaustion", 1880, he elaborated on the topic and described "Nervous Dyspepsia" (also referred to as "Dyspepsie Asthénique") as one of Neurasthenia's core characteristics.

According to Beard's experience with neurasthenic patients, Nervous Dyspepsia was in many cases "the first noticeable symptom of nervous exhaustion", and "the earliest sign that the body is giving way."

The way he saw it, a Functionally Disordered Stomach could be the only sign of Neurasthenia for several years, Before Nervous Symptoms Began to Develop in other parts of the body. Nevertheless, he insisted that nervous dyspepsia should be seen as a part of "the same general pathological condition as all the orders of symptoms here noted", and as symptoms which might "follow or accompany as well as lead this multitudinous army" of other neurasthenic symptoms. The first to coin the term neurasthenia gastrica, or gastric neurasthenia, was possibly also an American physician.

In a lecture to the Rhode Island Medical Society on 15 September 1880, William F. Hutchinson presented "Three typical cases of neurasthenia".

In one of these cases, which was presented under the headline 'Gastric Neurasthenia', the patient was a 47-year-old widower from New York.

Among the clinical features noted, was a **"facial expression anxious in the extreme, with dark circles around eyes", and his general appearance was described as "bad."**

Moreover, he was described as "nervous to a distressing extent", and as a person who "sheds tears upon any sudden emotion, and finds it impossible to keep still a moment".

The patient's most bothersome complaints, however, were located to the gastrointestinal tract:

> *"After drinking a large quantity of lager beer, some dozen glasses or more', the patient had been* ***'attacked with severe nausea and long continued vomiting', which later developed into a chronic 'congestive irritation of the entire digestive apparatus, attended by obstinate constipation."***

The following year, an abstract of Hutchinson's paper was presented to German medical readers through the "Schmidts Jahrbücher der in-und ausländischen gesammten Medicin", 1881.

The abstract – and the disease label in particular – caught the attention of Rudolph Burkart, who at the time worked as the physician-in-charge at the water cure resort (or Wasserheilanstalt) of Marienberg.

During this practice, Burkart had noticed that a large number of his neurasthenic patients presented with stomach complaints as a predominant part of their clinical picture.

Wilhelm von Leube, who a few years before had published his first paper on nervous dyspepsia (Ûber nervöse dyspepsie. Deutsches Arch. f. klin. Medizin. 1879). According to Leube, the symptoms of nervous dyspepsia were due to a local affection of the gut; a 'direct mechanical irritation of over-sensitive nerves'

Some symptoms seem to have been perceived as more common and typical for neurasthenia gastrica than others. Among these were a feeling of 'fullness' or pressure in the epigastrium (upper part of the abdomen), epigastric pain and a sense of 'burning' in the stomach, in addition to heartburn, nausea and 'eructations of inodorous and tasteless gas'.

These gastric symptoms were typically reported to be aggravated by intake of food.

Other authors suggested that certain kinds of food generally did cause more trouble than others.

In 1912 John Honeyford stated that:

"In most cases of gastric neurasthenia the carbohydrate portion of the food is not sufficiently acted upon"; in other words suggesting an impaired digestion of carbohydrates.

Honeyford also pointed to **'highly seasoned dishes, smoked and cured foods, sauce and condiments' as 'indigestible' foods which would aggravate symptoms.** Although suggested by the name, the symptoms of neurasthenia gastrica were not limited to the stomach.

Symptoms from the intestines were also reported as quite common, constipation in particular, but also sensations of 'fulness' or pain in different regions of the abdomen, flatulency and variable/ abnormal stools.

Moreover, as was noted already in the works of Beard and Burkart, a number of authors also reported that **the gastrointestinal complaints of neurasthenia gastrica in many cases were accompanied by symptoms apparently 'remote' from the digestive tract.**

For instance, J. Campbell McClure **pointed to tiredness, inability to concentrate, capricious memory, headaches, palpitations, sleeplessness as well as vague pain in muscles and joints, as some of the most common non-gastric symptoms associated with gastric neurasthenia.**

Robert Coleman Kemp made particular mention of 'a sleepy feeling, or even weakness or dizziness', and 'marked mental depression' as commonly associated symptoms, while Charles D. Aaron reported that **"fulness of the head, cephalalgia, migraine, inability to work, vertigo, lassitude, insomnia, hypochondriac and melancholic illusions," were some of the most common general symptoms of Gastric Neurasthenia.**

In the understanding of how general neurasthenia could develop with such a wide range of symptoms, the two most essential elements were 'loss of nerve power' and 'morbid exaltation of nervous sensibility', often condensed to 'irritable weakness' or, in German, 'reizbare Schwäche'.

Correspondingly, the basic understanding of the disease mechanisms of gastric neurasthenia, was that the manifold symptoms were caused by an increased irritability and marked weakness of the nerves innervating the stomach.

However, according to several physicians, the irritable weakness of the nerve-supply of the stomach might just as well develop 'in a fit constitution after the excessive expenditure of nerve force'. Some of the most commonly suggested factors suspected to drain the nervous system of energy, were overwork, worry, emotional excitement, 'overstudy' and other forms of mental over-exertion.

According to Dr John Harvey Kellogg, Superintendent of the Battle Creek Sanitarium:

> ***"Overactivity or too prolonged activity of the brain, especially worry and harassment of the mind, unquestionably excite the abdominal brain to a harmful degree and lead to gastric and other visceral disturbance."*** *- in "Neurasthenia or nervous exhaustion", 1915.*

Moreover, neurasthenia gastrica was observed to develop in the aftermath of other diseases, such as influenza, malaria or venereal disease. Reflex irritation from other organs of the abdominal cavity – predominantly the uterus, was also described as a common cause. In 1915, Captain J. Campbell McClure pointed to the ongoing war as a particularly common cause of gastric neurasthenia.

As physician to the Red Cross Clinic for Physical Treatment of Officers in London, he had seen 'several cases in which the foundation of a neurasthenia of a definitely gastric type was laid during the sieges of Ladysmith and Mafeking.'

He explained this by "the nerve-racking strain maintained for weeks, insufficient and coarse food, and the physical exhaustion of continued vigil', and found it conceivable that the war would continue to 'produce a large group of cases of this kind both in our navy and our army."

As to how **the different nerve centers could communicate with each other, and thus produce symptoms from several parts of the body when an 'irritable weakness' of the nervous system had developed.**

George Beard, for instance, based his views on **Reflex Theory**:

> ***"The body is a bundle of reflex actions. An irritation in one part is liable to produce an irritation in some other part."***

This was "true of all parts of the body", he continued, but he singled out the stomach as one of the most important of the reflex centers. McClure pointed to the importance of the exhaustion of the vagus centres, while William van Valzah, and J. Douglas Nisbet, on the other hand, assumed that the Communication Between the Gut and the Nervous System Occurred Primarily Through the Solar Plexus:

> ***"The solar plexus, receiving all the impressions from the abdominal and thoracic organs, is very intimately associated with the cerebrum. Through it sensation, thought, and emotion influence digestion. Through it and the pneumogastric nerves digestion affects the activity of the brain. It is the connecting link between the moral, the intellectual, and the vegetative life. It is this highest and greatest assemblage of sympathetic centers which unites the nervous symptoms of neurasthenia gastrica."*** *- in "The diseases of the stomach", 1898.*

The Solar Plexus was also in focus in the writings of Dr J. H. Kellogg, MD, who suggested there were actually 2 Brains to be considered in Neurasthenia, and they had the ability to mutually influence each other:

> ***"The region of the stomach is the seat of the solar plexus, the great Abdominal Brain which exercises a controlling influence over all the functions of digestion blood-Circulation, Elimination – All the Automatic Processes of Animal Life.***
> ***The Great Sympathetic Chain of Ganglia is the Center of the Organic life of the body.***
> ***Through the close Association of the Abdominal Brain and the Cerebrum there is an Intimate Connection Between Digestion and Mental Action.***
> ***It is through this Association of the Cranial Brain and the Abdominal Brain that Mental States Affect Digestion so Profoundly, and the Reverse."*** *- in "Neurasthenia or Nervous Exhaustion", 1915.*

Thomas D. Savill, physician to the West-End Hospital for Diseases of the Nervous System in London. In his Clinical Lectures on Neurasthenia (1899), Savill was, for his own part, convinced that Neurasthenia in the majority of cases was a result of a (primary) Gastric Disorder, and he explained why he had come to this conclusion.

After careful history-taking of 102 of his own Neurasthenia patients, he had found out that as many as 74 of these patients had experienced symptoms of "gastric derangement" prior to the development of other symptoms of Neurasthenia. Moreover, his experience was that when patients were efficiently treated for their Gastric Problems, their neurasthenic symptoms faded as well.

Savill's explanation was that gastric disturbances might produce neurasthenia via an "Autointoxic condition of the blood", in which the 'Toxic products of digestion may have a specifically poisonous effect on nerve structures'. (Clinical lectures on Neurasthenia, 1899).

He was not the only one to think along these lines. **The theory of Intestinal Autointoxication, commonly ascribed to the French physician Charles Bouchard, was embraced by many medical doctors during the latter half of the 19th century, and was a commonly suggested disease mechanism for a wide range of disorders.**

At its core was the assumption that Toxic Putrefactive Products of Digestion could cause systemic disease after being absorbed from the bowel:

> ***"The absorption of Toxins from the Intestinal Canal – caused by changes in the digestive juices, by imperfect digestion, fermentation and by bacteria – constantly takes place, and is the chief cause in perpetuating the trouble."*** *- J. T. Wright, in "Neurasthenia", JAMA, 1905.*

The Toxic Products of Digestion were in turn assumed to impair "in varying degrees the anatomical elements of the different organs and notably the nervous centres." Thus, by toxic attacks on the nervous system, the products of a disturbed digestive process could produce not only the local symptoms of gastric neurasthenia, such as "laborious digestion", but also almost any kind of

the previously mentioned "remote" nervous symptoms commonly associated with the condition, such as exhaustion, headache, insomnia, palpitation and melancholia. In 1891 the French physician Champagnac claimed that autointoxication was the true 'point of departure' of neurasthenic disturbances, and two other French physicians, Gilbert Ballet and Adrien Proust, ranged it as the **most important of all the modern 'theories, which ascribe the origin of the neurasthenic conditions to disorders of the gastric functions'.**

In Neurasthenia, the process of Intestinal Autointoxication was often perceived as being associated with, and facilitated by, a flaccid (atonic) stomach.

A weakness and loss of tone in the stomach walls was assumed to lead to poor motoric function (peristalsis), with constipation as a possible consequence.

"Intestinal Stasis" was in turn assumed to contribute greatly to an 'imperfect' process of putrefaction and, consequently, Intestinal Autointoxication.

Gastric Atony [Gastroparesis] (condition where stomach muscles fail to contract normally, causing severely delayed food emptying without physical blockages), was also reported to be associated with a dilatation of the stomach. Moreover, **Gastric Atony** was reported to be a common characteristic of the Neurasthenic Stomach, in its own right. For instance, in 1917, when describing his experiences with soldiers who had developed neurasthenia during the war, J. Campbell McClure pointed to **Gastric Atony as a condition which at the time was 'a source of considerable trouble to those who are dealing with war neurasthenics'.**

He told that during the past 2 years, he had met:

> *"A large number of soldiers suffering from neurasthenia, either with or without a definite history of shell shock, who, in addition to the physical exhaustion and psychasthenia common in these cases, have suffered definitely from sensations referable to the abdomen, such as aching in the left hypochondrium, pain in the epigastrium, a sensation of constriction in the lower sternal region, and a general feeling of sinking referred not only to the epigastrium but perhaps to the whole abdomen."*

In addition, the soldiers frequently suffered from loss of appetite and a feeling of distention of the stomach after eating, which could persist for several hours.

An X-ray examination of the stomach did, according to McClure, in the majority of cases show "a stomach slightly more capacious than normally and rather slow to empty." He distinguished between two classes of such cases, with slightly different underlying mechanisms:

> *"In the former class, who recover quickly and apparently completely after suitable treatment, I believe that the gastric atony is due to over-influence of splanchnics. In the latter class, whose convalescence is long and too often incomplete,* ***it appears likely that the nervous fault which produces the gastric atony is failure of impulses due to exhaustion of the vagus centres."***

As for the actual cause of gastric atony in these cases, McClure pointed particularly to the "emotion of fear":

> *"All these men have been subjected, apart from definite shell shock, to experiences which are exhausting physically and mentally trying. One has to remember in dealing with such patients at the present time that in the cases of the bravest man* ***the emotion of fear, or if we choose to call it so, of anxiety, is a contributing factor in the production of any condition of muscular and nervous weakness."*** *- Campbell McClure J., in "Gastric atony and war neurasthenia", Lancet, 1917.*

In 1903, Ballet and Proust concluded that "it seems certain that gastro-intestinal atony is more often the effect than the cause of the affection".

A few years later, however, the American surgeons MacLaren and Daugherty argued that gastric atony was 'the original cause of neurasthenia'.

Another suggested characteristic of the gut in gastric as well as general neurasthenia, was the so-called ptosis (sagging, downward displacement) of the stomach and/or intestines and other organs of the abdominal cavity, referred to as gastroptosis, enteroptosis, and visceroptosis, respectively.

Ptosis could be associated with gastric atony and was also described as a possible facilitator for Intestinal Autointoxication; the latter through 'stagnation' of the contents of the stomach and intestines.

It was also assumed that the descended organs could produce changes in the circulation of the various viscera of the abdominal cavity, with unfortunate consequences.

The physician who was usually credited for having been the first to describe a possible causal association between such "sinking of the viscera" and neurasthenia in the early 1880s, was the French physician Glénard.

During the following decades, several other physicians reported to have observed this abnormality in a number of neurasthenic patients, and some of them even went so far as to call it a "stigma neurasthenicum" – a distinct sign of neurasthenia.

One of them was the Canadian physician Hugh McCallum, who in 1906 stated that he looked upon "**ptosis of any of the abdominal viscera as a stigma of neurasthenia, and quite as pathognomonic of it as a sharp haemoptysis is of pulmonary tuberculosis."**

In a previous paper, he stated that as many as 90% of female cases of neurasthenia were "victims of visceroptosis", and he argued that the symptoms of visceroptosis were practically the same as those of neurasthenia – 'with or without local distress', which suggested a direct causal link.

Examples of symptoms of gastric neurasthenia which were also reported in visceroptosis, were a disturbed appetite, "a sense of fullness in the epigastrium, belching, acid taste" and burning pain in the epigastrium after eating.

The general nervous symptoms included "general weakness, changeable and

depressed moods, headaches and fulness of the head, vertigo, disturbance of sleep", and a number of other ailments (Ewald CA. The diseases of the stomach, 1900). Among the etiological explanations for the visceroptosis as such, were a "bad standing posture", "badly-fitting garments", high-heeled shoes and corsets, 'the imperfect use of the lower zone of the thorax, the absence of fat, and the want of tonicity in the abdominal musculature leading to defective intra-abdominal pressure'. In other words, as in the case of gastric atony, and other alleged abormalities of the neurasthenic gut, the nature and directionality of the relationship between these gastrointestinal conditions and the symptoms of gastric and general neurasthenia were in no way clear-cut matters.

In 1903, Ballet and Proust made the following summary of the situation:

> *"In short, the relations between dyspeptic states and neurasthenia may, we think, be summed up as follows:* ***"In the majority of patients suffering from nervous exhaustion the dyspepsia has merely the value of a symptom, but of an important symptom, since it may contribute largely to keeping up the neuropathic state. In certain cases – sufficiently numerous it seems – the disorder of the digestive functions has been the primary cause of neurasthenia; and it is against it that the treatment must principally be directed."*** *- in "The treatment of neurasthenia", 1903.*
>
> ***"There is no doubt that Massage Improves the Nutrition of the muscles and nerves, and favours a vigorous circulation, metabolism, and regular evacuation."*** *- Hemmeter JC., in "Diseases of the stomach", 1898.*

A more literal way of 'recharging' the nervous system could be performed through Electrotherapy. According to George Beard, electricity was one of 'the very best' remedies for the nervous dyspepsia associated with neurasthenia.

The therapy could take many forms; it could be general and directed towards the whole nervous system, or it could be more locally targeted.

One example of the latter, in the therapeutic recommendations for neurasthenia gastrica, was described by W. Fenwick:

> *"For the stomach a constant current of 3 to 5 milliampères is passed through the epigastric for 20 minutes daily, the negative electrode being applied over the lower dorsal region and the positive one immediately below the left costal margin." - Fenwick WS., in "Dyspepsia – its varieties and treatment", 1910.*

Other authors preferred 'direct electrisation of the organ by means of a metallic wire inserted into the ordinary stomach-tube', but Fenwick found this procedure 'unpleasant to the patient and tedious of application'.

Electricity could also be used as a remedy specifically targeted to relieve constipation, based on the following procedure:

> ***"One pole is inserted into the rectum and the other, consisting of a large metal disc, is successively applied to the surface of the abdomen at different points along the course of the large intestine. The interrupted current is to be preferred to the constant one, and each sitting should last for about half an hour."*** *- Fenwick WS., in "Dyspepsia – its varieties and treatment", 1910.*

Kemp argued along the same lines:

> ***"The diet should be abundant, the patient avoiding highly seasoned food, alcohol, strong coffee, and excessive smoking."*** *- Coleman Kemp R., in "Diseases of the stomach and intestines", 1910.*

Honeyford recommended a decreased intake of carbohydrates and an increased amount of proteins (fresh meat). Occasionally a 'fattening cure' was prescribed, particularly in severe cases associated with anorexia and weight loss.

A general advice given with respect to the intake of food, was that 'In every instance mastication must be thoroughly performed, a sufficient time be allowed for each meal, and no exercise permitted for an hour afterward.'

Moreover, s**everal authors, such as Riegel, emphasized the importance of so-called psychic treatment in neurasthenia gastrica:**

> ***"Psychic treatment is still more important than all these methods, for the personal influence of the physician is of fundamental importance in the treatment of these cases. Only if the patient has full confidence in the physician can we expect any good results."*** *- Riegel F., in "Diseases of the stomach", 1903.*

Hugh MacCallum, too, **stressed the importance of the 'training of the mind' for the patients.**

> ***"It has become my practice to reach certain patients by way of the printed page after failing with oral instruction. Often a passage from the Bible is more impressive than volumes of secular literature."*** *- MacCallum H., in "Gastric neurasthenia", British Medical Journal, 1906.*

One particularly popular therapeutic regime for neurasthenics in general, which included most of these elements to a smaller or lesser extent, was the so-called **'rest cure'** developed by the American neurologist Silas Weir-Mitchell.

The cure typically lasted from 6 to 8 weeks.

Strict bed rest, and isolation from family and friends were some of the key elements of the regime, in addition to overfeeding (a fatty diet mainly based on large quantities of milk), Massage and Electrotherapy.

The cure also had a moral element, and the personal qualities of the doctors and nurses in charge were important for a successful result. Weir-Mitchell's rest cure was also recommended for sufferers from gastric neurasthenia, and in cases of neurasthenia gastrica associated with visceroptosis, the Weir-Mitchell cure was described as 'the only proper treatment'.

In many cases of gastric neurasthenia the longlasting immobilization usually included in the Weir-Mitchell cure was considered to be harmful; particularly in those cases where gastric atony was assumed to be a part of the clinical picture.

In these cases, **immobility was thought to make matters worse and increase the gastrointestinal atony and associated constipation, and a 'partial rest cure', with Massage, 'passive movements' and faradic electricity was recommended instead.** The element of overfeeding in Mitchell's cure was another topic for debate when it came to the gastric form of neurasthenia.

As pointed out by McClure:

> ***"One has to remember that in all these cases there is present a stomach which has lost its tone in greater or lesser degree, which is unusually capacious, and which is very slow to empty. Rest in bed and over-feeding will not help this local condition."***

In those cases where **some kind of abnormality of the gastrointestinal tract was understood as the cause of gastric (and general) neurasthenia**, the therapeutic advice given was somewhat different. For instance, **when Intestinal Autointoxication was considered to be the primary problem, the aim of the treatment was to remove the source of Toxemia.**

This could be done by improving the 'elimination' and reducing the often associated constipation, by the means of 'Colonic Flushings'. Moreover, yoghurt was assumed to inhibit the toxic putrefactive processes of the intestines (Borgbjærg A. Combe: Bekæmpelse af Kvælstofforraadnelsesmikrober i Tarmen ved Indførelse af antagonistiske Mikrober. Ugeskrift for Læger, 1909). In some cases, a more radical and invasive mode of treatment option was suggested.

As pointed out by Campbell McClure:

> ***"In a certain small proportion of cases it may be even necessary, on account of long-continued and severe Gastro-Intestinal Toxæmia which resists any other form of treatment, to remove the colon and implant the ileum into the sigmoid, as recommended by Sir Arbuthnot Lane."*** *- Campbell McClure J., in "Neurasthenia gastrica", Lancet, 1915.*

Sir Arbuthnot Lane, was a British surgeon who became particularly associated with surgical treatment of Intestinal Autointoxication (Alimentary Toxæmia), and he also recommended this Treatment for Neurasthenics.

The Microbiome-Gut-Brain Axis

One interesting parallel is the understanding of the vagus nerve as having a crucial role in the brain–gut communication; which is acknowledged today, which was also (although more vaguely) suggested by some of the authors writing about neurasthenia gastrica.

Moreover, **the notion that we have an 'abdominal brain' which is interacting with our other brain, as was suggested in the debate about neurasthenia gastrica, would fit very well with the language in the current debate, where the enteric nervous system is frequently referred to as our 'second brain'. With the causal theory of Intestinal Autointoxication, the history of gastric neurasthenia also contains an element which may be seen as a historical forerunner of the present-day interest in the potential role of the microbes of the gut in the development of functional gastrointestinal (and other) disorders (The Microbiome-Gut-Brain Axis)."** - in "'Neurasthenia gastrica' revisited: perceptions of nerve-gut interactions in nervous exhaustion, 1880–1920", Microbial Ecology in Health and Disease, 2018.

The Microbial Organ in the Gut

"The innervation of the digestive tract is involved in determining the patterns of its movements, in the control of gastric acid secretion, in regulating movement of fluid between the gut lumen and body fluid compartments, in changing local blood flow, in release of gut hormones, in modifying nutrient handling and interacting with the gut immune system. **The gastrointestinal tract differs from all other peripheral organs in that it has an extensive intrinsic nervous system, the Enteric Nervous System (ENS), that can control functions of the small and large intestines even when they are completely separated from the Central Nervous System (CNS). But in reality the ENS is not autonomous. The neuronal control of gastrointestinal function is an integrated system in which local enteric reflexes, reflexes that pass through sympathetic ganglia, reflexes that pass from the gut and back through the CNS and central control systems interact.**

The Extrinsic Innervation of the Gastrointestinal Tract

At the gastrointestinal level, the mucosal surfaces are the first location where immunogenic particles, environmental toxins and microorganism-derived antigens gain access to the immune system.

The regulation of gut physiology is also achieved through the activity of both the Enteric Nervous System (ENS) and the Central Nervous System (CNS).

Enteric Nervous System is an extensive neural network, also known as the second brain, containing approximately 100 million neurons embedded in the gastrointestinal lining, similar number to the spinal cord. The ENS contains sensory neurons, inter-neurons, and motor neurons, which primarily control motility, absorption and secretion, but also visceral sensitivity. In addition, the Enteric Nervous System is wired with multiple terminals from ascending and descending Central Nervous System pathways that help to control gut function. To understand gut physiology and pathology, it is of particular importance to consider the role of the autonomic nervous system, and the Hypothalamic Pituitary-Adrenal Axis (HPA) because both systems also establish a vast and complex array of integrative and bidirectional interactions between the brain and the gut, the Brain Gut Axis.

Connections between the gut and the central nervous system can be conveniently classified as vagal, spinal thoracolumbar and spinal lumbosacral. Each of these includes afferent (sensory) innervation and efferent (motor innervation). The efferent pathways contain pre-enteric neurons that end within enteric ganglia and control or modify the activities of enteric neurons.

Pathways from the CNS also contain neurons that directly innervate a restricted number of gastrointestinal effectors, such as striated muscle of the esophagus (vagal innervation), sphincters (sympathetic innervation) and intrinsic blood vessels (also sympathetic innervation).

Vagal Innervation

The human abdominal vagus contains about 40,000–50,000 axons.

These fibers provide a sensory innervation and efferent (motor) control pathways for the upper gastrointestinal tract and digestive organs.

The afferents include mucosal mechanoreceptors, chemoreceptors and tension receptors in the esophagus, stomach and proximal small intestine, and sensory endings in the liver and pancreas.

There is a less prominent vagal afferent innervation of the distal small intestine and proximal colon.

Sensory information concerning luminal contents is detected by EEC cells which release hormones that act on vagal afferent nerve endings. This indirect chemoreceptor activation is important for the detection of nutrients and also potentially noxious agents in the gut contents. The functions that are regulated by the vagal sensory innervation include appetite and satiety, esophageal propulsion, gastric volume, contractile activity and acid secretion, contraction of the gallbladder and secretion of pancreatic enzymes.

Vagal Efferent Pathways

The vagal efferent pathways arise from the dorsal motor nucleus of the vagus and the nucleus ambiguus.

Most of these neurons are pre-enteric, that is, they form synapses with neurons in enteric ganglia, but some run directly to the striated muscle cells of the esophagus. The major roles of the vagal innervation are to control esophageal propulsion, to relax the lower esophageal sphincter for swallowed food to pass, to increase gastric capacity, to facilitate antral contractions, to relax the pylorus, to increase gastric acid secretion, to contract the gallbladder and to promote pancreatic exocrine secretion.

Throacolumbar Innervation

The thoracolumbar spinal cord connects with the gastrointestinal tract through spinal afferent neurons with cell bodies in dorsal root ganglia (DRG) and through sympathetic efferent pathways.**A high proportion of the afferent neuron endings is around arterioles in the gut wall.**

The axons of spinal afferent neurons also provide a sparse network of varicose axons in the myenteric ganglia.

Thoracolumbar afferent endings also branch within the lamina propria of the mucosa throughout the gastrointestinal tract, although their branching patterns have not been defined.

Rare thoracolumbar afferent fibers are found in the muscle layers.

As they pass through sympathetic prevertebral ganglia, the axons of spinal afferent neurons provide collaterals that form synapses with cell bodies of postganglionic neurons.

There is little evidence that pain comes from the healthy gastrointestinal tract. In fact, it seems remarkably insensitive to stimuli, such as cutting, that would cause pain elsewhere.

Gastrointestinal pain is associated with inflammation, and postinflammatory disorders. Experimental studies indicate that inflammation causes long term changes in the properties of spinal afferents, that causes unresponsive neurons to become sensitive and responsive neurons to become hypersensitive.

The sympathetic efferent pathways have 4 primary targets: myenteric ganglia, submucosal ganglia, blood vessels and sphincter muscle.

The preganglionic sympathetic neurons have their cell bodies in the intermediolateral columns of the spinal cord.

Postganglionic neurons of vasoconstrictor pathways are in sympathetic chain and prevertebral ganglia.

Postganglionic (pre-enteric) neurons with cell bodies in prevertebral ganglia provide a dense innervation of myenteric and submucosal ganglia.

In both cases these are inhibitory; the sympathetic innervation of myenteric ganglia inhibits excitatory effects of enteric neurons on the muscle of the stomach and intestine, thus slowing passage of the contents of the gastrointestinal tract.

The innervation of submucosal ganglia inhibits secretomotor neuron activity (see later section "Neural Control of Fluid Movement: Secretomotor and Vasomotor Reflexes").

Sympathetic post-ganglionic neurons contract the sphincters of the gastrointestinal tract, which, like the innervation of myenteric ganglia, inhibits transit of contents.

Pelvic Innervation

The distal colon and rectum are provided with afferent and efferent innervation via the pelvic nerves and sacral plexuses.

The pelvic nerves are commonly regarded as providing an innervation to the distal gut similar to that provided by the vagus to the proximal gut.

Neural Control of Fluid Movement: Secretomotor and Vasomotor Reflexes

It is essential that the movement of fluid between the lumen of the intestine and the body fluid compartments is regulated.

More than two blood volumes cross the mucosal epithelial surface each day, and disruption of fluid transport regulation, such as occurs in cholera intoxication, is life-threatening. One reason for the large flux is that the absorption of sugars (monosaccharides) and amino acids is through cation-coupled transporters.

Thus the absorption of a glucose molecule through the sodium/glucose linked transporter (SGLT) brings with it a sodium ion together with counter ions, mainly chloride. It is calculated that 100 gr of absorbed glucose takes with it 1.8 Litre of water. Enteric reflexes, through activation of secretomotor neurons, return water and electrolyte to the lumen. This fluid is drawn from the circulation and from the absorbed fluid. **Enteric secretomotor reflexes cannot act in isolation, they must be modulated to take into account whole body fluid balance.**

This control is exerted through blood volume and blood pressure detectors that change the activity of two sympathetic pathways, vasoconstrictor pathways and secretomotor inhibitory pathways.

The fine control of fluid balance through local (Enteric Nervous System) and systemic (sympathetic) reflexes is thrown into chaos when there is an excessive luminal content of certain pathogens or their toxins.

These agents, including Cholera Toxin, and pathogenic E. coli, activate enteric secretomotor neurons. **In mild cases, this stimulates diarrhea that helps expel the pathogens and their Toxic Products. When there are high levels of pathogens or toxins, the intestine is overwhelmed and a pathological, life-threatening hypersecretion can ensue. The hypersecretion results in copious diarrhea.**

The Enteric Nervous System and Gastrointestinal Innervation: Integrated

Neural control of the gastrointestinal tract is exerted by integration of signals that originate in the Central Nervous System and **Enteric Nervous System**. **Gastrointestinal function is maintained in the absence of influence from the Central Nervous System, but if Enteric Nervous System control of the intestine is lost, propulsion of content in the affected region is ineffective, which is life-**

threatening. Three major regions of the Central Nervous System connect with the gastrointestinal tract, the brain stem through the vagus nerve, the thoracolumbar spinal cord through spinal afferent and sympathetic efferent pathways, and the lumbosacral spinal cord through pelvic nerve afferent and efferent pathways.

Vagal afferents carry mechanoreceptive and chemoceptive information from the esophagus, stomach and intestine to the Central Nervous System, but do not signal pain. Thoracolumbar and lumbosacral afferents both signal pain of gut origin. In addition, there is cervical afferent innervation of the upper esophagus.

The primary control centers for the smooth muscle esophagus, lower esophageal sphincter, stomach, gallbladder and pancreas are in the Central Nervous System; they exert control through vagal efferent pathways.

The vagal neurons that control gastric motility, acid secretion and hormone release form synapses in the Enteric Nervous System.

The major efferent connections of sympathetic pathways are to myenteric ganglia, through which gastrointestinal movements are inhibited, to submucosal ganglia, through which fluid movement into the lumen is inhibited, and to intramural arteries that are constricted by sympathetic nerve activity. The efferent pelvic nerves convey the outputs of the lumbosacral defecation centers. The enteric nervous system consists of many thousands of interconnected ganglia that extend from the upper esophagus to the internal anal sphincter. These ganglia in human contain in total about 200–600 million neurons. Motor neurons in the enteric ganglia supply all major effectors in the gastrointestinal tract. In the small and large intestines, the Enteric Nervous System contains full reflex pathways that are essential to direct the movements of these parts of the digestive tract. Another critical role of the Enteric Nervous System, in concert with signals from the Central Nervous System, is whole body fluid balance. This is necessary because of the very large fluid load that is contributed to by water and electrolyte movement that is associated with nutrient digestion and absorption. The Enteric Nervous System contains a type of neuron not found anywhere else in the periphery. These are intestinofugal neurons, with cell bodies in enteric ganglia, that send their axons to sympathetic ganglia, to other organs (the pancreas, gallbladder and trachea), and to the Central Nervous System via the vagus and pelvic nerves. Thus the digestive tract is controlled through integrating centers in the brainstem, spinal cord, sympathetic ganglia and gut wall that are extensively interconnected through conventional afferent and efferent pathways and via the intestinofugal neurons.

The Vagus Nerve

The vagus (10th cranial nerve) innervates the pharynx, larynx and visceral organs. While it contains both motor and sensory fibres, it is the main afferent pathway from the abdominal cavity to the brain.

Information from the heart, lungs, pancreas, liver, stomach and intestines are delivered tonically to the brain via sensory fibres in the vagus nerve.

Sensory vagal inputs arrive in the Nucleus of the Solitary Tract (NTS) via the nodose ganglion which is chiefly made up of sensory visceral afferent fibres.

From there fibres ramify to widespread areas of the Central Nervous System, including the cerebral cortex and medulla oblongata.

There are 30,000–80,000 vagal afferent nerves that supply the intestine with a 9:1 ratio of afferent to efferent fibres in peripheral nerve bundles.

Vagal primary afferents innervate the muscular and mucosal layers of the gut with the coeliac branch supplying the intestine from proximal duodenum to the distal part of the descending colon.

Vagal innervation is densest proximally but is still significant in the colon.

The Vagus and Gut Bacteria

There is now strong evidence from animal studies that **gut microorganisms can activate the vagus nerve and that such activation plays a critical role in mediating effects on the brain and subsequently, behaviour.**

The field of microbial endocrinology developed out of need to understand the paradox in which stress resulted in increased death from a bacterial challenge at the same time greatly increasing the phagocytic activity of the immune system.

In considering the microbiota as an interactive player in the host that can both respond to signals from the host and influence the host through the provision of the very same host signaling molecules (i.e., neurochemicals) that are more commonly associated only with vertebrates, but in fact have a long evolutionary history involving the prokaryotes, the potential role of the microbiota in brain functioning and its potential for treatment of mental disorders becomes apparent.

A fuller understanding of the capabilities of the microbiota to interface with the brain and form the microbiota–gut–brain axis, but will also provide detailed examination of the consequences of the microbiota-driven gut to-brain communication for both health and disease.

> ***"If you are right that the bacteria in the gut can communicate with the brain and induce cognitive behavioral changes such as anxiety****, then why aren't all the patients we give antibiotics to in the hospital running around the floors crazy?" - NIH Director's Pioneer Award Study Section Member, July 2008.*

The spectrum of neuroactive compounds produced by bacteria that can potentially interact with the host also includes a number of neuropeptides.

That many of the described neurohormones produced by bacteria also function in mammals as part of the neurophysiological system suggests, that their production within the mammalian host can impact the neurophysiological aspects of the host including cognition.

What is still incompletely understood for the majority of bacteria from which neuroendocrine hormones have been isolated is the simple question of "why".

Why do bacteria produce neuroendocrine hormones?

There have been numerous reports since the 1930s regarding **the ability of specific bacterial species to produce and/or recognize through specific receptors neuroendocrine hormones many of which are involved in key aspects of neurotransmission. Given that bacteria are prolific producers of neuroendocrine hormones, as well as other neuroactive compounds, it would seem reasonable to conclude that such bacterial production of neuroactive compounds within the gut lumen could influence either host-specific neural receptors within the gut or extra-intestinal neuronal sites following luminal uptake into the portal circulation. There are a number of reports that provide support that neurochemical production by bacteria within the gut can influence behavior in both humans and animal** model systems. Most often, these reports employ probiotic bacteria, such as Lactobacillus or Bifidobacterium, many of which species belonging to these two genera are prolific producers of neurochemicals for which well-defined neural mechanisms are known by which behavior may be modulated. **Tantalizing evidence that microbial endocrinology does indeed play a role in microbiota-gut-brain interactions that ultimately culminate in changes in behaviour.**

If we are to understand how host and microbes together produce the full spectrum of health and disease phenotypes, we will need to determine which alleles are represented and expressed in the host, which microbes are present and where in the gut micro-environment the microbes are found and, for both host and microbes, how genes are expressed to produce metabolites within activated pathways. To understand the state of the human and microbial ecosystem in the gut, therefore, requires an accounting of an ecosystem of phenomenal complexity.

There are on the order of 3 billion base pairs in the human genome, but there are ~10 times more bacterial cells within the human body than bacterial cells and encoded within the genomes of those microbial cells is likely more than 100 times more distinct genes than are encoded within the human genome.

The importance of maintaining epithelial permeability tight to prevent the passage of noxious substances, was emphasized in the early 1990s, and reiterated by many authors thereafter." - in "Microbial Endocrinology: The Microbiota- Gut-Brain Axis in Health and Disease", 2014.

The Gut-Brain Connection: How it Works and The Role of Nutrition

"The communication system between your gut and brain is called the gut-brain axis. They're connected both physically and biochemically in a number of different ways. They influence each other.

The Vagus Nerve

Neurons are cells found in your Brain and Central Nervous System that tell your body how to behave.

There are approximately 100 Billion Neurons in the human brain. Interestingly, your gut contains 500 million neurons, which are connected to your brain through nerves in your nervous system.

The Vagus Nerve is one of the biggest nerves connecting your Gut and Brain.

It sends signals in both directions.

Neurotransmitters

Your gut and brain are also connected through chemicals called Neurotransmitters. Neurotransmitters produced in the brain control feelings and emotions.

Gut Microbes Make Other Chemicals That Affect the Brain

The trillions of Microbes that live in your gut also make other chemicals that affect how your brain works." - in "HealthLine", 20 August 2020.

Colon Cancer Metastasis to the Brain

"Some cases of Colon cancer can metastasize (spread) to other areas of the body, including the Brain. This occurs when cancerous cells break away from the tumour in the Colon, travel to the brain through the Bloodstream, or Lymphatic System and then begin multiplying within the Brain.

Less than 3% of patients with Colorectal cancer experience Brain metastases (it's much more common for Colon cancer to metastasize to the Liver, since the 2 organs are connected by a Large Blood Vessel).

Colon cancer is still one of the types of cancer most likely to cause Brain metastases (other types include Breast cancer, Kidney cancer, Lung cancer, and Skin cancer). People often mistakenly assume that someone with Brain metastases has Brain cancer. That's actually not the case.

When cancer metastasizes from one area of the body to another, the resulting tumours are still made up of cancerous cells from the original body part." - in "Colon Cancer Metastasis to the Brain", Moffitt Cancer Center, January 2025.

"It has become increasingly evident over the last 20 years that the Large Intestine is a highly specialised digestive organ, which through the activities of its constituent Microflora, rivals the Liver in metabolic capacity, and in the diversity of its biochemical transformations.

Approximately 90% of the 10^{14} cells associated with the human body are Microorganisms, and the vast majority of these reside in the Large Bowel.

The Colonic Microbiota consists of approximately 10^{13} cells which, with the possible exception of bacteria growing in the oral cavity, are physiologically very different to those associated with any other part of the host.

Several hundred bacterial strains and species normally exist in the large intestine, with viable counts typically being in the region of 10^{12} per gram of intestinal contents.

While host tissues and other substrates of endogenous origin (sloughed epithelial cells, mucins, pancreatic and other secretions), are continually being broken down and recycled by intestinal bacteria, the species composition and metabolic activities of the colonic microbiota are primarily determined by diet. Therefore, what we eat, particularly carbohydrate and protein, affects ecological, physiological and metabolic events in the large bowel. **Intestinal Microorganisms play a major role in health and disease, and affect human physiology in a multiplicity of ways. Large Bowel cancer along with Breast, Prostate, Lung, Endometrium, and Ovarian tumours are the leading causes of cancer mortality in the Western countries** (American Institute of Cancer Research, 1997).

In addition to these cancers, other Western diseases that also contribute significantly to morbidity and sometimes mortality, include:

1. Gastrointestinal Diseases:

Constipation, Hiatus hernia, Appendicitis, Diverticular Disease, Haemorrhoids.

2. Cardiovascular Diseases:

Coronary Heart Disease, Stroke, Essential Hypertension Deep Vein Thrombosis, Pulmonary Embolism, Varicose Veins.

3. Metabolic Diseases:

Obesity, Diabetes, Gallstones, Renal Stones, Osteoporosis, Gout.

The development of these disorders appears to be associated with life style and environmental factors of which diet is a major component." - in "Colonic Microbiota, Nutrition and Health", 1999.

Neurasthenia

"1. The majority of cases of so-called Neurasthenia are either victims of:

A. Nerve weariness dependent upon misdirected energy without proper rest at proper intervals.

B. **Nerve poisoning, the result of Constipation, improper food and accumulation of the Ashes of Combustion, Leucomaines and Ptomaines; a disposition to use the stomach too much and the rectum too little, and a failure to appreciate the importance of Pure Air as a Rejuvenator of tired and poisoned nature.**

C. Nerve demoralization resulting from unrelieved peripheral irritations.

2. There is less harm in the victim of disease directing his attention to special organs and peripheral points as the offenders of his comfort, than there is in having his mind absorbed in the contemplation of his nervous apparatus. In other words, it is an evil day for any one, man, woman or child, when the attention is concentrated upon the nerve centers, when the energies are directed toward watching the nervous symptoms; in fact, it would be well for them if they never had a knowledge of the anatomy and functions of their nervous system, and this knowledge should be the last presented to them for consideration.

The best way to cure the discomforts occasioned by nerve weariness and nerve poisoning, and even those of nervous exhaustion, which are far more serious, is to prevent them. Both on the part of the parents and children, we should teach them the importance of proper food, proper clothing and a properly opened condition of the animated system of sewerage.

We should impress them with the fact that the daily visit to the Temple of Cloaca, is as necessary as the morning and evening prayer.

When we recall the fact that 90%, of the women of the world are much more constipated than the traditional owl, we will realise what room there is for improvement in this direction.

A special missionary work should be entered into on the part of the profession among the teachers of our schools, **for they need not only to know the importance of the flushing out of the alimentary canal.**

All along the line **we are safe in keeping; The Cardinal principles both as Preventers and Curers of the condition mentioned:**

1. Elimination
2. Disinfection
3. Nutrition
4. Tranquilization
5. Oxygenation

Large Quantities of Pure Water Serve As Excellent Stimulators of The Eliminative Organs. Food that is Easily Digested and Readily Assimilated Is Important.

Under this head, butter and **milk stand pre-eminent.**

Sleep is indeed “tired nature's sweet restorer”, and it represents the life of the individual. Mothers should be impressed with the fact that children who are poor sleepers run the chance of growing up with wrecked nervous systems.

The average mother, as well as the average child, does not sleep enough.

Let us not forget that the majority of these cases, whether spurious or bona fide **Neurasthenia, Have Usually a Rotten, Crowded Condition of the Alimentary Canal, a long history of Constipation leading us up to Leucomaine and Ptomaine Poisoning and that the entire System of Secretory Glands is deficient and perverted in activity, and that the flushing out of the Emunctory System is called for.**

Change of Scene and Air are often indicated.

The elevated mountainous atmosphere, the ideal water and facilities furnished for drinking it in large quantities, and being hot it is all the more promptly eliminated, and at the same time **the Bathing in the Hot Water is Very Beneficial in the direction of relieving the pains which so frequently accompany these conditions. The judicious administration of Electricity is certainly indicated, but I am strong is the belief that more are benefited by discreet Massage."** - Dr I. N. Love, MD, in "Neurasthenia", Journal of the American Medical Association, 20 January 1894.

In Nature: Where There Is Balance; There Is No Disease

"In nature, where there is balance, there is no disease and the germ, in this case the B. Coli in the intestinal tract, performs a useful function.

Where the intestinal mucosa is healthy the B. Coli is non-pathogenic.

Any change in the host which affects the intestinal mucosa will upset the balance and will be followed by a change in the habit and the bio-chemistry of the B. Coli, which may then be said to become pathogenic, but it should be noted that the primary change, the disease originated in the host, which compelled the bacillus to modify its habit in order to survive.

I would ask you to keep this sequence of events in mind as a great deal of what I have to say about the Intestinal Nosodes is based upon this conception which I have confirmed by clinical and laboratory observations over the last 20 years." - Dr John Paterson, MB, ChB, DPH (Camb.), FF Hom., in "The Bowel Nosodes", British Homeopathic Journal, July 1950.

Viscero-Somatic and Somato-Visceral Spinal Reflexes

"In "Viscero-Somatic and Somato-Visceral Spinal Reflexes", Journal of the American Osteopath Assoc., 1907, Dr Louisa Burns, DO, observed that:

> ***"In the study of the physiology of the sympathetic nervous system it was noted that a lack of clearness was especially evident concerning the locality in which the viscero-sensory impulses affect the viscero-motor nerves. It occurred to me that a study of viscero-somatic and somato-visceral spinal reflexes might assist in determining***

> ***whether this co-ordination takes place chiefly in the sympathetic ganglia, or chiefly in the spinal cord. It is evident that viscero-somatic reflexes would be impossible if viscero-sensory nerves did not enter the cord, or if they did not form either direct or indirect physiological relations with the somato-motor neurons. On the other hand, somato-visceral reflexes would be impossible were not the somato-sensory axons related with the viscero-motor neurons. In all the somato-visceral reflexes the latent period was longer. The somato-visceral reflexes affecting the heart were most satisfactorily studied upon human beings. The results obtained with animals were in harmony with these.***
>
> ***Inferences and Conclusions***
>
> ***A very important, if not the only, pathway of viscero-sensory impulses enters the spinal cord through its posterior roots. Somato-visceral reflexes are much less circumscribed and direct than are viscero-somatic reflexes. Since abnormal conditions of the viscera follow such pressure upon somatosensory nerves as is sufficient to lessen conscious sensation, and since section of somato-sensory nerve is followed by abnormal conditions of the viscera, it is inferred that nofmal visceral activity depends in part upon the stimulation derived from the somato-sensory nerves. The possibility of recognition of abnormal viscero-somatic reflexes as an aid in diagnosis is inferred.”*** *- Dr Louisa Burns, DO, “Viscero-somatic and somato-visceral spinal reflexes”, Journal of the American Osteopath Association, 1 October 1907.*

She had been studying the mechanisms of reflex arcs in animal models to understand better the complex interactions between the viscera, spinal cord, and soft tissues.” - in “Physiology, Viscerosomatic Reflexes”, StatPearls, 1 May 2023.

> ***“Deep Reflexes Everywhere Exaggerated. Coma Preceded Death.”*** *- Dr Julius Mickle, MD, in “On Syphilis of the Nervous System”, Brain, 1895.*

> ***“A helpful part of this book is the exposition of the important influence of the pre-existing State of Tonus in the Vegetative Nervous System on the results obtained by subsequently stimulating it. Neglect of this principle explains much of the confusion and contradiction to be found in the literature.”*** *- Dr Wulf Sachs, MD, in “The Vegetative Nervous System”, 1936.*

Chapter 12

On the Causation of Disease

"When, the food has been properly digested, and elaborated in the stomach, and has passed into the intestines, it solicits admission into the system through those innumerable little vessels called Lacteals, which are distributed over the whole, surface of the smaller intestines, and absorb the fluid portion of the food, which is now called chyle, while they reject the coarser particles.

It is with the chyle only we have to deal, for that only enters into the system.

Well, then, this nutritive mater having been subjected to several previous tests, the eye having scanned it before it entered the mouth, the nose having pronounced it savoury, and the palate having approved of it; and further, it having been purged of its grosser particles at the time it wins absorbed by the lacteals, it is all poured into a single largo tube, called the thoracic duct, which conveys it into one of the big veins (subclavian) in the upper part of the chest close to the backbone.

And now being in the full stream of the systemic circulation it can be carried to every part of the body wherever it is wanted to supply the continual waste — the constant wear and tear which is always going on in every portion of the corporeal system.

But now the question arises, has this chyle, this elaborated alimentary matter, been perfectly purified!

Was every deleterious substance eliminated at the several ordeals through which it had to pass! Certainly not.

Unless the Lacteals had admitted other substances than those which were strictly alimentary, there would have been but little scope for the medical practitioner.

It is by the admission of what may be termed foreign substances into tint food, that the physician is enabled to produce any of the beneficial effects which he contemplates.

But **then that name unreasoning facility on the part of the lacteals of admitting the drugs which the physician prescribes, admits also a great many other things which he doesn't prescribe.**

Some of this deleterious matters, from the use of bad food, or impure drink, may get into the blood, whether we will or no; and there me many others, not positively deleterious in moderate quantities, although not alimentary, which we voluntarily imbibe; and these in their cumulative effect may become poisonous, and the fruitful causes of disease.

I will go on with the Emunctories in their more ordinary operation.

I say ordinary operation, for **even supposing that no foreign substances had been absorbed by the lacteals, but only simple nutritive matter, yet the blood would need cleansing — would need the aid of Emunctories.**

For there is reason to conclude that in the reparation of the constant waste of the body, by every muscular movement, may by every effort of our volition and our thought, and by all the wear of its internal machinery, which is perpetually going; on of itself, some corpuscles of the blood are destroyed and let floating there dead; and if dead then requiring also to be decently buried.

When I employ the word dead of these corpuscle, I am not using figurative speech, for these corpuscles of the blood have a real life of their own; it may be an unconscious life, but is a real life, and they are endowed with instincts to do certain work in a certain fashion, just in the same way that insects; like bees and ants, instinctively do certain work and only in a certain way.

These living corpuscles are fed by the aliments we imbibe, and when their life is over, for every minute they die by thousands, their dead bodies must be conveyed away.

This, then, is a constant cause of deterioration in the purity of the blood, irrespective of any poisonous substances which may have been imbibed by the lacteals.

Judging then, by the many other examples, of ingenuity so obviously displayed in the structured the animal fabric, we might feel quite sure, that there would be means provided for the removal of noxious substances from the blood and for keeping it pure. And so there are.

There are every where throughout the whole of the animal system means and appliances constantly at work pumping away all deleterious matter from out of the great circulation.

These then are the real Emungents of the system, and it will be necessary to speak of them more in detail.

At an earlier stage of anatomies investigation it was customary to call the liver and the kidneys the 2 great Emunctories of the animal system; the former currying off the waste matter which had no ammonia in it, example: nitrogen, the latter carrying off the waste ammoniacal product.

But the term Emunctory, as applied to these two great organs.

Has now been generally given up; because in point of fact, the Emunction or Cleansing of the system is by no means limited to these organs only, but is going on all over the system, and is performed by exceedingly minute organisms distributed everywhere.

I have already said that in the blood there are floating innumerable living corpuscles. The word corpuscle, means a little body; and very properly are they called bodies, because **when speaking of the glands, each has a life and instinct of its own.** They are all living bodies and all incessantly doing work.

Bees and Ants, are only at work by day; but these creatures, are at work by night as well as by day. Whether fixed to one locality as the glandular cellules are fixed, or whether free to move as the corpuscles of the blood are free to move, they are ever actively at work; the fixed ones, viz. those in the glands, resembling more the polyps and the sponges in the realm of nature, the corpuscles of the blood resembling more the bees which fly through the air.

But although alive, they, are subject to death; indeed they surrender their lives in the very discharge of the duty for which they were born.

Their dead bodies if left in the blood would soon pollute it, and highly necessary is it that provision should be made for carrying them away.

The vessels employed in this duty go by the name of the lymphatics, so named because the fluid they contain is not coloured red, as is the fluid which circulates in the arteries and the veins, but is a colourless lymph.

Although therefore they ramify throughout the whole system, they are not so obvious as are the arteries and the veins.

Should you, however, by any accident poison, by some venomous matter getting into a wound, you would very soon be able to trace the whole course of these lymphatics up the arm by their inflamed redness, the redness lining occasioned by the blood coming to their relief.

The direction of these Lymphatics is mainly to the liver, for there they deliver their cargo; the liver being as important, a goal for the lymphatic system as the heart is for the venous.

The liver on receiving these raw materials converts them into bile; and this bile passing through certain ducts is poured into the receptacle of the digested food immediately on its leaving the stomach.

It may excite a momentary surprise in us, that, this bile, which apparently is faecal matter drawn out of the system, should he mixed with the food just as it comes fresh from the digestive organs — defiling it apparently at the very time when it is prepared to he absorbed into the blood.

Nothing is more certain than that the most important prerequisite for health is that all our vessels should he kept clean, or, at all events, free from decaying animal matter. These numerous Emunctories, distributed throughout the interior of our system, are provided for the express purpose of preserving it pure — pure in those intimate parts of our structure which are beyond our own reach.

It is very necessary, therefore, that these Emunctories should be maintained in a condition of normal efficiency.

A morbid condition of the body will generally depend upon the blood being overcharged with matter which ought to be purged away, and the Emunctories must be stimulated to do it.

But sometimes, also, it will happen that the Emunctories, in their own voluntary efforts to drain off foreign matter from the blood, will be excited to too great violence. It is unwise to neglect premonitory symptoms of disorder; but it is still more unwise, nay, even dangerous, ignorantly to prescribe for oneself — tampering with **poisons, which might possibly produce most mischievous effects on the delicate organisms of the body. It is quite true that a man may really become his own best physician.** It was a saying of the Roman Emperor Tiberius that a man must be a physician or a fool by the time he is 30; not, however, by prescribing drugs for himself, **but by so adjusting his habits of food, and sleep, and cleanliness, and bodily exercise as to require no drugs.**

To do this, it requires not only a careful observation of what habits are most conducive to health, but also a firm and courageous exercise of self-control, so as to adhere rigidly to the dictates of experience and observation.

What makes a large degree of cautious observation necessary in the matter of food, is that at our ordinary meals we ingurgitate not aliment only for our sustenance, but many other things for our delectation.

The great majority of diseases owe their origin not to deficiency of nutriment, but to its overplus.

The blood in consequence becomes overloaded with alimentary matter, and the Emunctories, although working night and day, cannot carry it all off.

The corpuscles of the blood are multiplied to an inordinate extent, and the more delicate blood vessels are almost ready to burst with the plethora of the fluid within them.

Gout is not so much a disease, as a beneficent provision to relieve the system, from excess of nutriment is proved by an analysis of the chalk-stones, which are deposited at the points of the gouty man's toes.

They are found to consist of the ingredients which enter into the constitution of his animal food. As for rheumatism, it is only another form of gout.

Unless, the amount be correspondingly reduced, or the superfluity worked off by strong bodily exercise, morbid action of some sort will supervene, simply because the energies of the Emunctory organs are overtaxed.

The diseased action which will ensue will not be the same in every individual, but will vary according to his idiosyncrasy.

If these superfluities should be conjoined with more poisonous ingredients, obtained from (wrong choice of food & drinks, and or), the habitual use of certain specific medicines, then a simple boil may be angered into a carbuncle, or **cumulative poison may even corrode the tissues and the bones.**

Neuralgic pains seem due to the presence of some of these innocent poisons in excess. An overcharged venous system is ever liable to congestion, and should congestion result in the internal rupture of any blood vessel, there is always considerable peril.

True, the lymphatics immediately set to work to convey away the extravasated blood (as we see a black eye regain its colour in a few days), but if this result is not speedily achieved, one of 2 effects follows:

1. If the extravasated corpuscles meet with a thin living membrane, they retain their vitality and begin to build up solid animal tissues in the wrong place, tubercles it may be or hard tumours; but if on the other hand the blood corpuscles should die, they begin to decay, and nothing is more corrosive to neighbouring tissues than decaying blood.

As bleeding gums, unless carefully rinsed, destroy the teeth, so do internal haemorrhages destroy any structures, whether bones or tissues, which lie long in their proximity." - in "The Emunctories", Australian Health Society, April 1883.

The Death From Pneumonia Is Caused by Auto-Intoxication

"As Bouchard says, the causes of diseases may be many, but the processes following those which produce disease can be relegated to 4 types.

These 4 Chief Pathogenic Processes are:

1. **Primary Elementary Dystrophies;**
2. **Nerve Reactions;**
3. **Disturbances Antecedent to Nutrition;**
4. **Infection.**

In attempting to place before you in a concise manner these thoughts upon **Auto-Intoxication**, I will have occasion to refer to the process of **disturbances antecedent to nutrition, this is the most important factor in the development of Chronic Diseases, and one that should not be overlooked when attempting to prevent the development of acute disease.**

To understand the antecedent disturbances, we must first be acquainted with the process which takes place in all healthy tissue, and which we term metabolism.

For the purpose of illustration we may take the instance of a muscle of definite structure; it enjoys a free supply of blood and displays, during contraction, energy, heat and sound. It produces certain chemical substances, carbonic acid, water, etc.

The blood becomes venous, i.e., loses oxygen and certain elements that supply nutrition to the tissue.

The character of the changes that take place in the muscle will depend largely upon the material supplied to the tissues of that muscle.

Thus the protoplasm acts on and alters the lymph, and the lymph acts on and alters the protoplasm, this constituting the vital process, the life of tissues, so that it is apparent that the healthy activity of the tissue will depend upon the kind of material supplied. In considering the metabolic changes in the tissues, we must always remember that if the waste material be carried from the tissues by the blood, these products of cell activity must be eliminated by the Emunctories, that the blood may be relieved of its load of waste in order that it may carry again to the tissues the material prepared for their nutrition and the oxygen that must be incorporated in order to have healthy cell activity.

Now, we can see how much we must depend upon the Emunctories to relieve the system of the poison produced in the metabolism of tissues, and in order that their functions are properly performed, it is necessary that the blood, circulatory apparatus and nervous system be in good condition.

So here we are again liable to have a double reaction, the Emunctories failing to act properly if either the blood, nervous system, or circulatory apparatus become disordered, or the Emunctories fail to functionate properly.

That the primary cause of disturbances in metabolism may be looked for from 2 sources, i.e., the product supplied by the blood for pabulum, and the oxygen, admits of no dispute.

If the plasma takes to the tissues a supply that is over-rich in various constituents, that contains poisons that have not been eliminated by the Emunctories, or that is deficient in nutritive principles, or if the supply of oxygen is insufficient from any cause, the tissues will not be capable of performing their metabolic changes in a proper manner.

We will look for cause of interference with metabolism which originate in the intestinal tract.

For instance, we have a patient, as all have had, who presents himself for treatment and complains of feeling much depressed in the morning upon awakening, slight headache, probably has slept poorly, is dizzy upon attempting to rise from bed, possibly almost falls while washing his face, is very sensitive to slight changes in the temperature, in other words, takes cold easily, disturbances of vision, and possibly contraction of hands, as pointed out by Kussmaul, Beaumetz, and others.

In this case we examine the stomach carefully and find that there is dilatation; there is also eructation produced that may become fetid, still, owing to the inactivity of the muscular coat of the stomach, eructations are not always present. Regurgitation with acid odours may take place.

This is positive evidence that there is fermentation in the stomach.

The faeces are generally acid, and peculiarly offensive; and upon careful inquiry we may find that although the operations are soluble there is a feeling that the act is incompletely performed, and there is likely to be burning about the anus.

In such a case we will find congestion of the liver, because the organ has attempted to prevent the poisons generated in the intestinal canal from getting into the general circulation.

The metabolism in the liver becomes weakened, and eventually the organ becomes indolent, and allows the poison to enter the general circulation and we have, as a result, Auto-Intoxication.

Again, we have the nervous system exposed to a shock; there is a disturbance in the circulation; the cutaneous vessels are contracted, and there is an increased amount of blood in the central organs; the great regulating apparatus, the kidney, does not respond; the equilibrium is not re-established and, as a result, we have possibly a catarrhal condition of the common bile duct which interferes with the outflow of bile.

There is also suppression of the part taken by the liver in dis-assimilation, and waste products that should be eliminated are reabsorbed and the result is Auto-Intoxication which would be of much more frequent occurrence if it were not for the permeability of the kidneys. In this we have a constant menace to the entire economy, for the irritating products which escape by the kidney, are likely to irritate that organ to such an extent that it may fail to eliminate the poisons that have been absorbed from the liver.

Therefore it is the duty of every physician to watch and investigate these important Emunctories, and every care should be taken to relieve them of the injurious effects of the elimination of these poisons by diluting them as much as possible.

In diseases of the air passages, Auto-Intoxication is so palpable to everyone that we need hardly dwell upon the subject.

The accumulation of carbonic acid and other waste products in the system, which should be eliminated by the lungs, is one reason why these diseases are often so difficult to manage, and why Pneumonia, for instance, is such a fatal disease, the gravity of disease increasing in proportion to the amount of eliminating lung tissue involved; **in other words, the death of the patient from Pneumonia is caused by Auto-Intoxication.**

In concluding, **I repeat, that in those cases of serious impairment of the metabolic changes in the tissues; where oxidation is incomplete; where the nervous system is unstable; the circulatory apparatus is defective; the kidneys, lungs, skin, bowels or the liver are being overworked, either from the products of dis-assimilation or mal-assimilation, and in spite of those cases where one or more of the Emunctories are defective in themselves, consider the possibility and the probability of Auto-Intoxication.**

These causes the primary disturbances antedating the nutrition of every form of tissue in the body originates, that in these disturbances we often find the commencement of not only such diseases as Bright's disease of the Kidney, Diabetes, acute Yellow Atrophy of the Liver, but that Carcinoma, Sarcoma, etc., may have their origin from the same cause.

It is the duty of the physician of today to guard against the Accumulation in the System of such products as Poison the Tissue, such as cause Auto-Intoxication, and in this way disturb the General Nutrition." - Dr J. R. Lemon, MD, in "Auto-Intoxication", The Medical and Surgical Reporter, 2 March 1895.

> ***"The Physical Roots of Disease are: Toxic Accumulation, and Vitamin and Mineral Deficiency."*** *- Dr Ulric Williams, MD, in "Hospitals and Hooey or Health?", 1941.*

> ***"It became impossible to find a decisive factor in the vast literature of the production of these malignancies, as physicians looked and are still looking for one specific factor only.*** *The solution is that* ***it is not a single factor but generally one of many factors or an accumulation of one poisoning for a long period of time,*** *as the experiments of Itchikawa and Yamagiva show.* ***They needed about 9 months first to damage the liver, kidneys, etc.*** *— another proof of reactions in their totality. That a very strong poison can damage the liver in a few days and produce a hepatoma in 10 days does not speak against it. This cannot be compared with* ***the slowly progressive deterioration in our system caused by modern civilization.*** *From work in our clinic,* ***we know that many diseases do not appear independent of each other.***

> ***Sinus inflammation is frequently combined with chronic bronchitis or bronchiectasis, also with laryngitis, nephritis, and other distant infections. Chronic cystitis is frequently united with appendicitis. Surely, cystitis is associated with a combination of disturbances in the digestive organs. Gall-bladder diseases, mostly combined with liver alterations, appear together with myocardial changes and later cause cirrhosis of the liver. Consequently, where the defence of the body is essentially reduced, there frequently are bacterial infections of one or several organs.***
>
> *These clinical findings bring us to the conclusion that* ***several different types of pathological changes may occur as the consequence of a deep general cause in the body*** *which* ***we can subordinate under one leading idea, the law of totality or the loss or diminished degree of "healing power".***
>
> ***Thus, the development of disease, its course and healing process, do not depend so much on the type of tissue or organ involved, but more on the general healing power of the entire organism, united or centralized in all its metabolic processes for the most part concentrated in the liver. Contrary to this concept, our textbooks and journals have separated different diseases. There are, of course, differences in the type, development, complications, prognosis, etc., but the basic idea must be maintained that the defense and healing power is an essential part of the whole body and must be restored, whatever organ or organs may be involved or whatever cause the malignancy may have had. I repeat: In general, the recovery from a malignancy means the restoration of the whole body from a kind of degeneration.*** *" - Dr Max Gerson, MD, in "A Cancer Therapy", 1958.*

Auto-Intoxication And Disintoxication

"At the Annual Meeting of the British Medical Association, held in London in July 1910, a paper was read by Dr Guelpa, of Paris, on "Starvation and Purgation in the Relief of Disease", British Medical Journal, 8 October 1910.

Dr Guelpa gave an outline of **a New Treatment**, Combining periods of Abstinence, **with Purgation, which had given him remarkable results in Diabetes and Other Chronic Diseases, and cited 2 cases, 1 of Diabetes with commencing Gangrene, and the other of severe and old-standing Gouty Arthritis, in which the "Disintoxication" Treatment was applied with a success one certainly could not look for with any confidence from any methods of treatment in ordinary use.**

The Importance of Auto-Intoxication As A Factor In The Evolution of Many States of Chronic Disease is becoming more and more widely recognized. It must be borne in mind that the excess of proteid is taken mainly in the form of flesh food (Meat), a form of food rich in purins, and prone to **undergo decomposition in the alimentary canal, with formation of toxic substances probably somewhat of the nature of ptomaines.**

It would appear improbable, on the face of things, that quantities of flesh food largely in excess of the needs of the individual can be consumed day by day without leading in very many cases to evil results; **to a condition of self-poisoning, in fact, or Auto-Intoxication.**

Though the reality of **the Condition known as Autointoxication, and the Importance of the Role It Plays in the Evolution of Diseased States, are very widely recognized nowadays in the medical profession.**

Dr Guelpa, makes the deduction which logically follows from it, and, finding an individual suffering from illness which he considers to be **an expression of a condition of Self-Poisoning, says:**

> ***"The primary object of treatment in this case should be to relieve the patient of the poisonous matters or toxins which are making him ill, and to do this as rapidly as possible."***

This process of removal of toxins Dr Guelpa terms "Disintoxication", and his method of carrying it out is to prescribe complete abstinence from food for a few days, and **a copious daily purge, his object being:**

1. To induce the organism, by the withholding of food, to "burn up", so to speak, its waste, effete and toxic matters.

2. To remove the products of this combustion freely and regularly.

If, a bland saline purgative such as sulphate of soda (Hunyadi Janos water or simply 4 dilute solution of the salt) be used, the treatment can be carried out for a period of 3 days without any hardship or suffering.

Dr Guelpa statements in this regard I have verified repeatedly.

It is in the treatment of Diabetes, a disease which he regards as pre-eminently an expression of Auto-intoxication, that Dr Guelpa has made most extensive employment of his method. The results obtained are very remarkable, and are such as cannot be obtained with any approach to certainty by any other method.

Diabetic Gangrene is generally regarded as an almost certainly fatal complication, and one whose progress it is impossible to arrest by treatment.

In a large percentage of cases the first 3 days abstinence-purgation treatment removes sugar completely from the urine.

All this, it seemed to me, proved, so to speak, mathematically, **that disease is a state determined and kept up by the presence within the body of a quantity of products of fermentation; toxines and the débris of poisoned tissues, which the organism must eliminate before it can return to a condition of health.**

The more rapidly this elimination is effected, the more prompt and perfect is the re-establishment of health, often, indeed, at a level considerably above that obtaining before the illness. These ideas I have applied consistently and without intermission throughout an extended period of busy medical practice, and I have no hesitation in saying that I have invariably seen them confirmed by the event.

So much is this the case that a feeling of weakness on the part of my patients gives me no longer any anxiety; **this false sensation of weakness being, in reality, nothing but an expression of a condition of encumberment with toxic products and cellular débris, of which it is important to relieve the organism as soon as possible. The proof of this lies in the fact that in these cases, if an efficient purge be given, the patient feels, other things held constant, less weak on the following day.”** - Dr G. Guelpa, MD, in “Auto-Intoxication and Disintoxication”, 1910.

What Is Disease?

“Disease is Any Deviation from the Normal Condition i.e., from health.

Health is best and most concisely defined as the condition in which all the vital organs perform their functions rhythmically. A disorder in one organ, upsets the others. Health implies that all organs, are working in harmony.

Disease is either:

1. **Functional**
2. **Organic**

Functional Disease, is one in which the physiological action is disturbed, but does not show pathological lesions or morbid anatomy.

Disease is Organic when it gives indication of morbid anatomy.

A disease may be both functional and organic; but it may be purely functional without showing any change of structure, the physiological action alone being disturbed. Hence a good knowledge of Physiology and Anatomy is necessary in order to understand disease.

The Blood

Arterial blood is scarlet; venous blood is blue; dead blood is black. Under the microscope blood is nearly colourless. It is made up of water and salts and the red and white blood corpuscles. It also contains fibrin forming elements; fibrin itself does not appear in the circulating blood. **The function of the blood is to carry nutrition. If the circulation is disturbed a disturbance of the nutrition will occur.**

Some parts of the body suffer more from interrupted nutrition than others.

A constitutional disturbance carried to the extreme always produces inflammation.

Diseases of the Digestive System

The presence of the food stimulates the gastric juice to flow.

As soon as the acidulation comes up to a certain point, the pylorus opens and the products of digestion (chyme) pass out into the duodenum, where the bile and pancreatic ferments act upon it.

The Action of the Bile is 3 Fold:

1. **Changes the Acid reaction to Alkaline.**
2. **Emulsifies the Fat.**
3. **Acts as a Laxative.**

The Pancreatic Juice contains 4 Ferments:

1. Amylopsin to digest starch.
2. Steapsin to digest fat.
3. Rennin to digest milk.
4. Trypsin to digest proteids.

In the duodenum the chyme is changed to chyle.

In the intestine the food meets with succus intericus, which Pawlow calls the "juice of juices."

The food is absorbed by the villi of the small intestine.

In the villi are the small lymphatics which take in the chyle, carrying it to the receptaculum chyli and from there on through the thoracic duct to the heart; the villus capillaries absorb the other products of digestion and carry them to the liver.

The Stomach is the Fountain of Health; if in good condition the animal is well.

In man Indigestion is the Main Factor Causing Disease, and this is also true in the other animals.

The food is either too bulky, or too concentrated; too rich or too poor; too wet or too dry; contains too much indigestible matter or not enough of it; the animal is either over-fed or not fed enough.

As regards the tendency of digestive organs to develop disease: this depends largely upon the parts of the digestive system most often in use; such parts will be most abused.

In the horse the food is a short time in the stomach, and a long time in the bowels.

Consequently the horse has less disturbance in the stomach than in the bowels; diseases of the bowels are common.

In ruminants the reverse conditions attain; diseases of the stomach are common, and rare in the bowels.**Many diseases come from Bolting the Food.**

It is a recognized fact that wholly digestible food produces paralysis of the stomach. For this reason it is not a good plan to feed a horse on flour: the stomach requires the cellulose covering of the grain."- in "Theory and Practice of Veterinary Medicine: Notes Taken from Lectures", 1911.

What Causes Fever

"Puerperal Fever;

"On the 8 May 1701, the wife of an officer in a royal residence, living about 4 leagues off, having been delivered 3 days before, sent for me by the diligence.

I found her with fever, the abdomen hard, tense, and so painful that she could not bear any thing over it, not even her chemise.

The lochia had ceased for 2 days, and instead of them there exuded a serous matter, reddish, and inclining to black, of insupportable odour, with very violent darting pains, which occasioned my calling the mid-wife, who assured me that the after-birth was quite entire.

But as circumstances seemed to indicate the contrary, I placed the patient in a position as if to deliver her, after which I introduced without difficulty my finger into the interior orifice of the uterus, where I found a small membranous substance.

I put another finger, and between them drew away this small substance.

I then brought away several clots of blood.

These were all most offensive, and several other similar ones came away during part of the night; but the lochia resumed their ordinary course, and in the morning I left the patient free from all the accidents with which on arriving I had found her seized, because by removing the cause, the effect was destroyed, and she became quite well.

Hence, then, whether the blood be vitiated by primary introduction of certain extraneous substances, or by the secondary effects of previous inflammation of the vein, a series of morbid actions will arise, which reproduce all the injuries of puerperal fever.

The views I have advanced as to the real nature of this malady, may be farther supported by an analysis of 3 other series of facts, in all of which, there is a great resemblance to each other, and to the effects seen in puerperal fever.

I mean:

1. The effects of wounds from dissections;
2. The viper bite;
3. The effects of some acknowledged diseases of the fluid, &c.

In all these, with very considerable differences, referable to differing causes, we have striking similarities; and in all, the solids are only secondarily affected.

But I trust, that what I have advanced, will be sufficiently pertinent to my conclusions, to permit me merely to indicate these sources of additional support.

If the reader will compare these with the lesions of puerperal fever, and with those produced by injuries and wounds, after surgical operations, with those produced by injections into the blood-vessels, he will find, that they all agree in disposing the body to effuse its fluids; to set up inflammations, of the most varying kind, in most distant and least connected parts of the body: that the anatomical characters of the lesions of puerperal fever, those following injections into the vessels, and those occasioned by injuries of veins, arising after surgical operations, and those from punctures in dissecting, are extremely alike, and that the variations are dependent, much more on the point at which the circulation has begun to be injured, than on any essential distinction in the nature of the maladies produced.

In puerperal fever the injury is, almost invariably, in the uterus or its appendages; hence the frequent circumscribed peritonitis, metro-peritonitis, and ovarian disorganization.

In punctures, from dissection, the chest is first affected; in injuries of the head, the head and the liver, with which it is so intimately connected.

In 8 out of 10 cases of phlebitis, following bleeding, the head and chest were the seats of inflammation, and in none was the abdomen affected.

In all, there is purulent or fluid deposit, in muscles, cellular membrane, the joints, eye, and in the centre of organs generally.

There is great accordance, even in their exceptions from this law; for, in all, it occasionally happens, that **the commencing point of injury is not the most injured, but that it is passed over while the poison falls on some other part.**

There are some peculiarities deserving attention, in the effects of injections of the arteries. In both Gaspard's and Cruvelhier's experiments, the operation was almost always intensely painful, unlike the effect of venous injections, which were painless.

It was found that gross substances, such as mercury, oil, extract of opium, did not readily permeate the arterial capillaries; and thus producing a mechanical impediment to the circulation, gave rise to rapid gangrene, or serous infiltration, or inflammation.

Cruvelhier's experiments tend to show that substances injected into the arteries will produce varying effects, according to the greater or less facility with which they pass from the arterial into the venous circulation.

If they are arrested in the former, there is gangrene; if they pass into the latter, we have all the complications of the so-called phlebitis, abscesses in muscles, in the eye, the joints, the liver, softening of the various tissues, inflammations of distant organs, and depositions of pus, blood, lymph, or serum.

Both experimenters agree in stating, that in the living body, the transmission from arterial capillary to venous, is extremely difficult.

The quantity of injection, whether in vein or artery, and the vigour of the animal, modified the result, says Cruvelhier, in the most singular way; a small quantity being eliminated by intestinal or urinary secretions, while a larger dose killed.

The quality of the substance also influenced the result.

Alcohol produced less pain than ink (Cruvelhier).

In 6 experiments, in which ink and water, or alcohol, was injected into the femoral vein only, **the ink always caused more pain than the alcohol.**

Many substances were innocuous, while others were extremely deleterious.

In whatever point of the venous system, except in the system of the vena portæ, **foreign substances are introduced, they will ultimately be found in the lung, and there cause inflammation and tubercle.**

It is by these 2 systems of the vena portæ, and of the pulmonary capillaries, that all substances transported in the circulating vessels are at last arrested or eliminated.

And the late experiments of Tiedemann and those of Magendie prove, the one for the liver and the other for the lung, that these 2 organs are the great Emunctories of the frame; and it is owing, perhaps, to this, that they, of all the organs of the body, are the seats of the greatest number of maladies.

The Causes Vitiating the Blood are Particularly Rife in the Puerperal State

We have seen, that all the accidents of P**uerperal Fevers may be produced artificially by vitiating the blood; and that the blood may be vitiated in at least 2 ways: by direct insertion of noxious matter into the blood-vessels, as in inoculation, injections, poisonous bites; or it may be vitiated by injuring the solid vessels mechanically, thus creating inflammation, which Inflammation Furnishes the Matter that is Conveyed into the Torrent of Circulation to Infect the Blood.**

We have also seen, **that putrid animal substances are among the most noxious poisons to the blood; that besides these, there are many animal fluids, which, though not putrid, still are extremely injurious — as pus, lymph, and especially the recent exudations caused by inflammation of the serous membranes.**

We may ask, therefore, whether these 2 conditions of danger are present in the puerperal state:

1. Are the vessels mechanically injured?
2. Are they in contact with any noxious matter?

It will at once, be acknowledged, that the uterus after child-birth combines both these conditions." - Dr Robert Ferguson Murray, MD in "Essays on the Most Important Diseases of Women", 1839.

> ***"Disease is Nature's Method of completing what seems a very superfluous chain of actions, and man's duty is to second her efforts by stimulating the Emunctories."*** *- in "Gaillard's Medical Journal and the American Medical Weekly", 1883.*

The Influence of Vitality Upon Secretion

"As far as I can ascertain the general notion about secretion, it is, that it is essentially an active process; and that increased secretion, as a necessary consequence, implies the idea of increased action in the secreting organ.

Thus we speak of Perspiration as Increased Action of the Skin; Diarrhoea as Increased Action of the Bowels; Diuresis of the Kidney; and the like.

Still farther, we consider that various organs can be stimulated or goaded into increased action, and we find such ideas constantly put into formulas in the following manner: Diaphoretics, Diuretics, Aperients, etc., are Given to Increase the Action of the Skin, the Kidneys, the Bowels, and the like.

Under other circumstances, we have the idea of increased action put in another form; thus, **in Rheumatic Fever we are told that Perspiration is an "effort of nature" to throw off or eliminate a certain poison; in the Diarrhoea accompanying many cases of Bright's disease, we are told that the bowels take on "increaser action" to relieve the kidneys; that in Scarlatina, the kidneys take on increased action so as to supplement the deficient action of the skin, etc.**

In all these instances, and many others we might name, there is a steady idea apparent, that increased secretion implies increased action, and that increased action implies increased power.

This idea receives corroboration from the constancy with which increased secretion from the nostrils, bronchi, urethra, and vagina, are spoken of as produced by "inflammation" of the Schneiderian membrane, of the mucous membrane of the bronchi, etc.

Thee first fact to which I would call attention is, that during the short period of life which elapses between an apoplectic stroke and its fatal termination, we have, in a vast majority of instances, if not universally, an abundant perspiration upon the skin, and a copious secretion (I use the word for want of a better) of mucus in the trachea and the larger bronchi.

Cold clammy perspiration, and the "death rattle" in the throat, have long been recognised in many diseases as immediate harbingers of death." - Dr T. Inman, MD in "On the Influence of Vitality Upon Secretion", The British Medical Journal, 30 April 1859.

"As to "Nerve-Power."

What do we really know of its influence on secretion?

We know that under **certain mental emotions, certain secretions are increased or diminished;** that the effects of dividing nerves, going to certain organs, is uncertain, and there our real knowledge ceases. Per contra, **we see secretion going on in plants, where there is no nervous system.** The same may be said of the "actinia", in which no such system can be demonstrated; and the same of transparent larvæ, whose every nerve we can trace. We can see in the transparent part of the kidney of the triton, that the renal tubes and Malpighian bodies and capsules are unaccompanied by nerves and yet secretion goes on.

We cannot demonstrate the presence of nerves in the membrane lining the Haversian canal, or in the lacunæ of bone or cartilage.

No nerve can be demonstrated in the membrane covering articular cartilage, nor does the anatomist pretend that there is a nerve for every small lobule of the liver, or for every individual air-cell in the lung.

The peritoneum, pleura, and pericardium, are not universally covered with nerves, and I do not think that any microscopist has discovered an abundant supply for the arachnoid, yet all these parts secrete their own peculiar fluid.

If, then , secretion will go on without nerve-power being demonstrably present, we must not appeal to that force to get us out of our difficulties; this is, simply to explain something, of which we know little, by referring it to something of which we know less, a very common error nevertheless.

As a matter of fact, I believe that **all living matter comes under the laws of inorganic force**, in direct proportion to the diminution of organic power.

In that we agree.

My wish is to show that there is a condition of the body intermediate between perfect health and absolute death, which has not yet been sufficiently studied.

The living body has certain powers and tendencies, which we speak of as organic or vital.

The dead body has certain others, which we know as physical and inorganic.

Of the mutual reaction of these opposing forces, when the former is weakened, we really know little.

Circumstances have induced me lately to investigate them as closely as I can.

The results attained are of extreme interest.

I will not enter into them, however; but sum up the question before us in the words of one of the most original thinkers of the day, Mr Lewes. "What is the organic process on which this excess of secretion (in debility) depends? Vitality is only a general phrase.

I cannot help thinking that the old idea is correct which says that increased secretion results from an increased activity of the secreting organ, increased special power, though caused, perhaps, by an organic disturbance which is coincident with diminished general power. The latter point being brought to light, the attention should be directed to the modus operandi."

I doubt myself whether we can consider that "increased special power" can be present in an organ secreting over abundantly, when such secretion is diminished by local stimulants as much as by general ones." - Dr T. Inman, MD in "Influence of Vitality Upon Secretion Reply to Mr Spender", The British Medical Journal, 2 July 1859.

The Body in the State of Pneumonia and its Relation to Other Diseases

"Acute Rheumatism, which we have watched with considerable interest, on account of their presenting the serious complication of Pneumonia of a low type affecting both lungs. **From whatever circumstances it arises, it is an unquestionable fact, that the low forms of pneumonia are far more common in towns. Asthenic Pneumonia, or Typhoid Pneumonia, as it is often called, is a disease of by no means infrequent occurrence, often presenting itself as a complication of some pre-existing disease, sometimes existing as a simple primary affection**; under either condition, it possesses some peculiar features which merit your especial attention. The descriptions of disease which are given in systematic treatises and lectures are generally derived from certain typical forms, and it is necessary that this should be so; but in applying the knowledge you have thus gained to clinical observation, you will be perpetually reminded that the proportion of cases which realise, in all respects, the descriptions you have read, is very small indeed; and you must be prepared to encounter many and wide deviations from the model form which has been placed before you.

Such is eminently the case with inflammation of the lungs.

Perhaps no malady is attended with less uncertainty in its diagnosis than a genuine case of simple sthenic pneumonia: on the contrary, there are few more insidious than the same disease in its asthenic form.

Where asthenic pneumonia exists as a secondary affection, it is not infrequently so entirely destitute of special symptoms that its presence may be entirely overlooked ; and were it not for our knowledge of the circumstances under which its occurrence may be expected, our attention might never be directed to the chest.

In each of the cases at present under our consideration, there was no reason whatever to suspect the existence of the disease prior to the physical examination of the lungs. In feeble or unhealthy subjects, again, pneumonia, although it be the sole or primary affection, is often deprived of some of its most characteristic signs.

When pneumonia occurs as a secondary affection, it is spoken of as intercurrent. **It is a more or less frequent complication of many diseases, which are produced by the presence of a poison in the blood; thus it is met with in the course of typhus fever, in erysipelas and surgical fever, in scarlatina, measles, and influenza, in remittent and yellow fever, and, as we have also found, in acute rheumatism.**

It appears not improbable that it may sometimes exist **as the direct consequence of a morbid poison where no other indications are afforded of the presence of that Poison in the Blood, just as in every epidemic of scarlet fever we find isolated cases in which the characteristic affection of the throat is the only symptom of the disease which is present.**

Thus, whilst erysipelas is prevailing in the wards of a hospital, and the subjects of wounds or of operations are liable to be seized with that malady, instances every now and then occur of patients similarly circumstanced

suffering from asthenic pneumonia, which we have every reason to refer to the poison of erysipelas, although the usual cutaneous inflammation be absent.

But the disease is also met with where we have no reason to suspect the existence of any specific poison in the blood; it may occur after exposure to cold, or to the operation of any ordinary cause of simple inflammation, in enfeebled individuals who have been exhausted by overwork, by anxiety, or by other depressing agencies, or who have lowered their health by intemperance, or by unhealthy habits of life. Such appear to be instances of ordinary inflammation, occurring in a debilitated constitution, which imparts to them their asthenic type.

Yet, in many of these cases the early development of delirium, or of diarrhoea, or, as I have seen more than once, of jaundice, together with a manifest and alarming tendency to sinking, affords reason for the suspicion that some poison has either pre-existed in the blood, or has been produced by the exciting cause of the disease; and this suspicion is strengthened by the observation, that in such cases the urgency of the symptoms bears no proportion to the extent of the inflammation; thus, I have seen these serious symptoms present, and hasten rapidly to a fatal termination, where the inflammation has been limited to one lung, and absent when it involved the entire lower lobe of both lungs. Where pneumonia is present under any of the circumstances I have indicated, the signs of its existence may be obscure; the energies of the constitution may be so deeply depressed by the injurious influences under which they have been labouring, that the power of reaction is prostrated, and the indications of the disease are proportionally deficient. It is surprising what an amount of inflammation may be inflicted upon the body under certain circumstances, without its appearing sensible of its presence.

This want of reaction will generally bear a proportion to the depressing nature of the poison, or of any other cause which has been previously in operation; thus, **the poison of measles does not generally exert any very lowering influence upon the system, and the signs of pneumonia, when it occurs, are sufficiently indicative.** On the other hand, with the extreme prostration which attends the presence of the typhus poison, the greatest vigilance is necessary to render ourselves aware of the occurrence of the inflammation. Such differences arise, not from any diversity in the inflammation itself, but in the circumstances under which it takes place.

Nor is pneumonia singular in this respect; other inflammations, occurring under the like conditions, may be equally insidious. In puerperal fever, e.g., we not infrequently meet with instances in which inflammations of other solid organs, of the serous membranes, or of the joints, even runs on to suppuration, without its presence having been ascertained until it has been revealed by a post mortem examination. In the 2 cases which form the subject of the present remarks, the inflammation affected both lungs.

This is consistent with the usual operation of poisons, and warns us, when we encounter the disease on one side only, to keep our attention alive to the condition of the opposite side.

The Inflammatory Fever

In cases where a specific poison exists in the blood, the inflammatory fever is, of course, merged in the peculiar fever which attends the operation of such poison, and is of a low type. Where no specific poison is present, the inflammation may set in with a rigour, and sometimes with sharp feverish reaction; but the symptoms speedily assume an asthenic character, and may be attended, even at an early stage, by delirium and other serious symptoms; and the patient may manifest a marked tendency to sink. In all these particulars, however, there is great variety. In a case of uncomplicated pneumonia, which I saw the other day, the pulse sank below 100 after the 3rd day. In another similar case, in which both lungs were involved, the intellect was clear, and the pulse was below one hundred after the third day; whilst in 2 others, in each of which only a single lung was affected, the pulse was rapid; there was low delirium, and in one, retching, diarrhoea, and floccitation; and death occurred in both, at an early period, with every symptom of exhaustion. Pain in the flank, or iliac region, is sometimes an attendant of inflammation, probably of the base of the lung. In one remarkable instance, I believe the pain was seated in the pillars of the diaphragm, as it was chiefly occasioned by hiccough, which followed the presence of food in the stomach, and was so intense on any attempt to move the trunk, that it was next to impossible to examine the posterior region of the chest. You may, perhaps, expect me to assign the absence of the chlorides from the urine as an additional diagnostic sign of the presence of pneumonia; but since attention has been drawn to this subject by the observations of Dr Beale and others, the symptom in question has been found to be by no means peculiar to inflammation of the lungs; but to be present in other forms of acute disease. **Pneumonia, though a sufficiently serious disease, has, if uncomplicated, a strong tendency to recovery;** but this tendency may be overcome by the noxious influence of a poison in the blood, or by a state of constitution in which the powers of the body have been prostrated by debilitating influences. **Hence your judgment will be regulated rather by those symptoms which relate to the state of the patient's general health, than by those which indicate the extent of the inflammation. The same circumstances will influence the progress of recovery.** A state of cachexia will not only retard this process, but may even turn it into a very unfavourable direction. **It promotes degeneration rather than repair,** and hence may create a tendency to suppuration or gangrene. We had a striking illustration of the truth of what I have said in the hospital the other day (British Medical Journal, 7 May 1859). **There is one awful accident which sometimes happens in this disease, of which it is very necessary that you should be aware the occurrence of sudden death by fainting.** I have twice seen this unhappy termination to the low form of Pneumonia; and once to acute bronchitis occurring with miliary tubercles, and with the heart in an early stage of fatty degeneration, 2 of the 3 patients had suffered from much anxiety, and from overwork. I have also been told by a friend, of a case of subacute pleurisy, in which death took place in the same manner. **Pneumonia, when uncomplicated, Has A**

Natural Tendency To Recovery. Now in the disease in question, the concurrent circumstances indicate either that **the cause itself of the inflammation seriously depresses the nutritive powers, or that it is allied with some other agency which tends to produce the same effect; and we have to do our best to prevent the favourable tendency of the inflammation from being overborne. The object of stimulants is to keep up the energy of the circulation; and their employment must be regulated by the state of that function. It will, therefore, be desirable not to load the blood with an unnecessary quantity of excremental matter, especially when so important an Emunctory for carbonaceous matter as the lungs, is diseased. I need not say that due attention must be paid to the state of the secretions, and particularly to the alvine evacuations; and that while you secure the necessary relief to the action of the bowels**, you must avoid weakening your patient by the undue administration of purgatives, particularly those of the more powerful class. **Support, by light, nutritious diet, is of great importance.** By the judicious administration of beef tea, in small quantities, at short intervals, you may, in mild cases, even avert the necessity for stimulants, or at least for those of the stronger kind." - Dr J. Russell, MD, in "Clinical Lecture On Asthenic Pneumonia, Delivered To The Students Of The Birmingham General Hospital", The British Medical Journal, 2 July 1859.

Fainting: Important To Note

If a person Faints (lose consciousness – fainting / syncope - from a brief lack of blood flow to the brain. Don't Allow the Person to Fall, but gently Lay Down the person. Don't Hold the Person Up. If the person is held in the standing position, it will delay recovery, blacking out when standing up (syncope), happens due to a sudden drop in blood pressure (postural hypotension), where blood pools in the legs, depriving the brain temporarily of Oxygen. Gently lay down the person, in order to Increase the Bloodstream Flow to the Brain. For Fainting will occur, if there is an impediment to the flow of the blood, to the central portion of the system, and reacting to the pulsations or to the nerve forces in the head, causing a lack of coordinating and equalization in the circulations through the system. If you cut off the circulation, you certainly feel faint. The effect of poisons upon the general circulation, Toxic Forces, which produce Weakness, and incoordination in the Body (these from poor circulation, incoordination of organs with the eliminations), these allow for fainting, thus more Open Air (Oxygen) is helpful for the body. Take that, that acts as a stimuli to the respiratory system, as will allow the oxygen through the lung area to be more effective in clarifying the blood supply. Faint spells, can be resolved through the activity of the heart, by the application of Colonic Irrigations, Osteopathic Manipulations, Chiropractic Adjustments, Healthy Diet, Open Air, these will bring change for the Circulatory System, allowing the respiratory system to act, and be active with the system so that the circulation will relieve it.

The Sequels of Scarlet Fever and Measles

"As far back as the year 1843, I published in the pages of the Gazette some pathological remarks on scarlet fever, showing that this disease is, at a certain period of its course, an inflammatory one, requiring the aid of antiphlogistic measures.

As my experience enlarged, my views become, of course, wider, and I was able to compare scarlet fever with other disorders, especially with measles.

It is not generally admitted, even if it be understood, that there is an essential difference between scarlet fever and measles exhibited in the particular mode in which the poison of either disease subsides of itself, or is eliminated from the constitution-the one subsiding or settling upon the liver, or being eliminated through it, and the other subsiding or settling upon the kidneys, or being eliminated through them.

Whatever depresses the vital forces is the cause of struma - a cause whose habitation is favoured by the congenital or acquired debility of the great nervous centres - the cerebro-spinal axis, which, in the discharge of its several functions, betrays a greater or less imperfection in their respective failures.

Measles and scarlet fever, both of them being a poison eventually set free, the latter through the kidneys, and the former by the liver.

I appeal to those who have carefully attended to these two diseases, and request them to consider whether they have not observed diarrhoea follow upon measles, and renal affections succeed to the scarlatina?

The 3 great Emunctories of the frame, are the lungs, the liver, and the kidneys, by the kidneys are eliminated the azotised or nitrogenous compounds in a fluid form, by the liver the carbonaceous materials in a solid form, and by the lungs the same carbonaceous materials in a gaseous or aerial form - namely, that of carbonic acid gas.

Cruveilhier, in some very striking experiments, has shown, that, **by introducing certain heterogeneous particles into the blood through the veins, one or other of these 3 great Emunctories becomes deranged according to the kind of poison or obstruction that has been introduced.**

The first effect of these deleterious substances is on the veins themselves, that is to say, provided that these substances are arrested in their course before reaching the arterial branches or ramifications of the circulating tree, producing pus in the veins phlebitis, in fact, gangrene, and death.

But if these heterogeneous particles pass forwards from the veins into the arteries, their ultimate effects fall upon the more vital organs far removed from the seat of the original mischief, giving rise to abscesses in the muscles, the joints, the eye, the liver, softening of the various tissues, inflammations in distant organs, depositions of pus, blood, lymph and serous effusions.

Gaspard agrees with Cruveilheir in asserting that, in its course along the current of the circulation, the poison finds great difficulty in its transmission from the arterial to the venous capillaries; while Cruveilheir remarks that, in

successful cases, the poison, when dilute or in small quantity, is eliminated by intestinal or urinary excretion, but that, when large or concentrated, it kills.

Tiedemann and Magendie have, indeed, put the question almost entirely at rest by their experiments, which demonstrate that the liver and the lungs are the 2 great Emunctories of the frame; and it is owing, perhaps, to this, says Dr Ferguson, who has written very ably on this point of pathology, and from whose work on Puerperal Diseases the foregoing observations are chiefly borrowed it is owing, perhaps, to this, that they (the lungs and the liver) are, of all the organs of the body, the seats of the greatest number of maladies.

Surgeons know well enough the fever that follows upon amputation when the veins have been injured, or have become the focus of suppurative inflammation, a fever, which is well known to them in its source as it is in its almost invariably fatal issue.

And the accoucheur knows far better than I am able to describe to him, the formidable symptoms of puerperal peritonitis, its rapid progress, and its lamentable catastrophe, a catastrophe originating, as Cruveilhier has so picturesquely portrayed, in a pathological condition both of the womb in particular and of the constitution in general, precisely similar to that following upon the amputation of a limb, or **the introduction of a morbific poison into the veins; deranged excretions, pus, &c., together with inflammation of the veins, (phlebitis) disturbed circulation, typhus fever, delirium, purulent infiltrations, and death. In fact, the patient dies of poison.**

It is probable that some of the symptoms of the hectic infesting the last stages of phthisis pulmonalis may be attributable to the absorption of pus from the lungs, and that the colliquative diarrhoea which precedes the end may arise from the purulent matter continually welling up from the ulcerated lung, and as frequently swallowed as spat out by the patient; for the pus thus swallowed carries with it the germs of struma, and infects the intestinal glands with it; besides which, diarrhoea is, as is generally known, one of the modes by which pus is evacuated from the system.

I have been led to introduce these remarks in order to show that it is not a private opinion of my own, but that it is the conviction of some of the most approved pathologists in Europe, that the mass of circulating blood may be poisoned, and that the poison thus circulating is eliminated from the blood through the channel of one or other of the 3 great Emunctories of the frame.

Thus, it will be found that, after the measles have passed by, and the eruption has effloresced and disappeared in the usual way, there supervenes a stage characterised by gastrohepatic symptoms, eruptions at the angles of the mouth, or sore eyes, (lipitudo, or chronic conjunctivitis of a scrofulous aspect).

The liver is either directly or indirectly brought to a halt; there is black or pale, and eventually exceedingly yellow, bile. The countenance becomes flush and excited, the sleep disturbed, the appetite diminished or lost, and the pulse and heart's action accelerated. It may be there is bilious vomiting or diarrhoea, in which what is popularly called “an overflow of bile”, shows itself.

On the loss of appetite quickly follows failure of strength, and with the hurry of the pulse is associated fever.

Now, **if the poison of measles be not eliminated through the liver, or if the liver remain torpid and inactive even under the exhibition of its ordinary medical stimulants or reagents, it will follow that the fever runs into the type of what is usually known as infantile remittent fever**, that is to say, a fever with irregular intermissions, chiefly affecting the mucohepatic surfaces, and continuing from one to 6 or 8 weeks.

During his anxious interval, there will be observed obstinate derangement of the entire alimentary canal, a very white tongue, costive or relaxed bowels, thirst, absolute loss of appetite, debility, delirium, emaciation, and death; or, on the contrary, instead of death, recovery from the lowest and most alarming stage of attenuation and decline.

The most favourable crisis is vomiting - the vomiting of yellow or green bilious matters, or diarrhoea, sudden and unexpected, by which the alimentary canal is discharged of its morbid contents, or the liver is emulged of its overloaded or poisonous congestion.

But if this diarrhoea or vomiting do not take place, the fever proceeds, and may, after having lasted a certain number of days or weeks, subside by leaving the little sufferer as thin as a ghost and as pale as the waning moon.

When we consider that the kidneys, the great Emunctories of those deleterious elements, which, if retained within the round of the circulating blood, act as a specific poison on the brain, are the organs primarily and chiefly affected, there can be no hesitation in declaring, that, if their natural or normal tone be not restored at once, death must, sooner or later, be the inevitable result.

This is the simple fact.

The inflammation of scarlet fever is, by one of the hitherto unexplained operations in disease, translated from the skin to the kidneys, which, when thus attacked, are no longer able to excrete the nitrogenous compounds from the blood, and, consequently, become the immediate instrument for interrupting and putting a stop to the functions of the arterial and cerebro-spinal systems together; for, if these nitrogenous or azotised materials be not excerned, but are retained and sent back on the brain, they operate as a direct poison, depress the vital forces, and eventually disable and annihilate the whole process of life.

The truth is, when, upon discovering that after scarlet fever the urine contains no lithic acid, nor any of the lithates, (the lateritious deposit of health), but that, on the contrary, it betrays the presence of the phosphates, or albumen, or blood, (hæmaturia). The result of renal disorder in consequence of scarlet fever, is profound debility, a debility which, as it generally happens at an early or a premature age, it is very mournful to witness.

At its commencement there is doubtless a stage of inflammation.

It is during the inflammatory stage that the brain is troubled with meningitis, a kind of inflammation by no means uncommon in connection with primary or secondary disorders of the kidney.

One of the saddest results is, that, as the brain declines in power, stimulants are proportionally more and more requisite; for the sinuses of the encephalon are, from their anatomical construction, incapable of contraction, and, consequently, cannot accommodate themselves to the diminished stream of blood.

Now, as the heart declines in power, the jet of arterial blood thrown up into the brain is depressed, the same stream does not continue to reach the great nervous centres, energy declines, and, with the loss of cerebral energy, declines pari passu the tonic functions of the spinal cord and the kidneys.

Thus, power is lost, and with the loss of power in general is also lost the particular energy to excern **the lithates - those poisonous elements of the circulating mass of blood:** in short, all is lost, except under the pressure of ardent spirits and the highest therapeutic tonics, which can, however, be sustained only for a limited length of time. The glands of the neck inflame, indurate, and run into suppuration: the pus is discharged, ulceration ensues, and sometimes lays bare an extensive surface: the limbs become cedematous, the cellular or areolar tissue mortifies over those points of bone unavoidably pressed upon by the bedding, the entire skin becomes white, dry, and furfuraceous, and anasarca is formed. The progress is soon told. The phosphatic diathesis is established. In protracted cases, renal calculi are formed and passed, life is prolonged, but the patient is cut off from the fellowship of life, and death calls him to his account by means of dropsy, paralysis, or coma." - J. A. Higgenston, Brighton and Sussex Medico-Chirurgical Society, 5 August 1847, in London Medical Gazette.

Prophylactic Treatment of the Sequela of Measles and Scarlet Fever

"Prof. Scoutetten, Chief Physician of the Military Hospital of Metz, advises **frictions with warm sweet-oil all over the body,** the face included, when the redness is gone. After this friction the patient is replaced in bed, where he should remain about 2 hours.

The next day he should take a warm bath, and remain in it 1 hour.

After the bath, he is replaced in bed, and 2 or 3 hours afterwards, when the skin is quite dry, another friction is made similar to the first.

This is generally sufficient to ward off the unpleasant and well-known sequelæ of the 2 above named Exanthematous Fevers; but when the attack has been violent, and the dead epidermis has not completely fallen off, these means should be resumed until the dermis has regained its functions.

Scoutetten **has rarely gone beyond 4 frictions and 2 baths.** These precautions being taken, the patients can, according to the author's experience, go out with impunity." - in "St. Louis Medical and Surgical Journal", 1860.

The Importance of Iodine

“Dr Heintz, of the University of Erlangen, has an article on this subject in a recent number of Virchow's Archiv.

His investigations into the behaviour of iodoso-benzoic acid and on the influence of the iodine alkalis on absorption are of special interest.

Iodoso-benzoic acid discovered by V. Meyer, possesses the property when applied locally of splitting off free iodine in contact with iodine alkali circulating in the blood.

The author attributes the resorptive properties of iodine to its influence on the leucocytes the leucocytosis that follows the introduction of iodine also follows the introduction of indifferent salts.

It might be supposed that the iodine alkali in the blood or tissues was split up in the region of greatest tissue change therefore in the leucocytes, the free iodine then acts back on the leucocytes and excites them to greater resorptive activity.

The Treatment of Chlorosis and Anaemia

A recent writer on this subject is Dr Frieser, who devotes an article to it in the Klin. Therap. Wochensch., 42 99.

According to him treatment must take three directions: the direct medicinal, the symptomatic, and the hygienic-dietetic, and he must first of all seek to restore the lost equilibrium of iron in the system.

To this end resorbable and assimilable iron must be introduced into the system in sufficient quantity, care being taken not to disturb the digestion.

He would exclude all the inorganic preparations of iron, as they are inferior to the ferratin.

Dietetic hygienic treatment embraced all the measures necessary for ensuring a well - regulated mode of life.

First of all everything that interferes with the function of the bowels must be removed.

The food must be easily digestible, non-irritant, and as varied as possible. The chief food must be milk.

But milk cannot always be taken in sufficient quantity by adults , it sometimes causes diarrhoea and a constant feeling of fulness. Patients must be careful , and be protected from overwork.

As regards Hydro-Therapeutics daily rubbings are useful, and act beneficially on the general health and on the strength; Massage and faradisation are sometimes exceedingly useful in anæmics.” - in “The Medical Press”, 6 December 1899.

Iodine A Major Factor in the Treatment of Fevers

"Prior to 1910, was used as a household remedy for fevers. In 1910 it was used as a last resort to treat Dr Bisey who was dying of a severe malaria infection, and made a miraculous recovery. As a scientist, chemist and consulting engineer and friend of Mahatma Gandhi, Dr Bisey was so impressed with the potential of the iodine compound that he subjected it to thorough chemical analysis and research. The result was BESLIN, that stood for "Best Liquid Iodine", which was marketed in England in 1913.

Dr Bisey settled in the United States in 1917, establishing the American Beslin Corporation, in Delaware. In 1926 Laboratoire Durveaux purchased the Beslin Corporation. The New York-based company engaged in clinical studies and collection of medical data, and testimonials on BESLIN." - in "Atomidine", ChemEurope.com, 2024.

"The nascent reacting iodine that was used for many illnesses during the 1930's was distributed by Schieffelin and Co.

They sent a survey questionnaire to several thousand physicans, and dentist who had tested it clinically. They received over a thousand responses.

A Druggist Circular was produced, and a portion of that is copied below.

A nascent reacting iodine that is produced by the same method used by Sunkar Bisey." - John Brookshire, in "Rapid response to: Traditional herbal medicines for malaria", British Medical Journal, 11 November 2004.

Atomidine in Medicine

Made and Distributed by Scheffelin & Co.
For Atomidine Company, Mount Vernon, New York
Druggist Circular, 7 March 1933

"Atomidine (BESLIN), is a stable compound of iodine in a saline solution that liberates the element in an atomic or nascent state on contact with an excess of solvent, such as the fluids of the body. No other active medicinal agents are present. By liberating nascent or atomic iodine, Atomidine furnishes the organism with this element in such a form that it may be readily utilized.

The lethal dose of Atomidine in animals is very large, which accounts for the absence of untoward effects in its clinical use.

Due probably to its rapid absorption and its ready combination with harmless proteid or other organic compounds in the body, iodism very rarely occurs even in sensitive persons. **Atomidine acts beneficially in iodine deficiency diseases, gastro-intestinal disorders, and asthenic conditions.**

It has the property of reducing blood-pressure in cases of hypertension. Atomidine is an efficient diuretic and urinary antiseptic, acting in either an acid or alkaline medium.

Dosage

Approximately 1/100 grain of iodine is present in 1 drop of the solution.

The average dose is 5 to 10 drops in one-half glassful of cold water, repeated every 2 or 3 hours.

Frequent small doses are more effective, than larger amounts at less frequent intervals.

When an intensive effect is desired 20 or more drops may be administered over the critical period and repeated as required.

Atomidine should be diluted only at the time of taking, and never given after a starchy meal.

It should not be administered in combination with other drugs.

Atomidine is a scientifically prepared ethical product of Atomic Iodine, endorsed and prescribed by many leading doctors and is the culmination of many years of research work of Dr S. A. Bisey, scientist and inventor.

Since its discovery in 1914, it has been the first and foremost ethical preparation of iodine that liberates Atomic Iodine upon contact with body fluids.

It is Non-Poisonous, Non-irritant, Stainless, Odourless, and a Water Soluble compound, safe for internal administration.

During 12 years of test period and research work it received endorsement from the medical profession as a recognized product of high medicinal and scientific value and one of the greatest contributions to Materia Medica.

This led to the adoption of its scientific name Atomidine (atomic iodine) in keeping with medical terminology, by which name it has been known since 1926.

Thousands of doctors in America and other countries have prescribed Atomidine and have reported splendid results in a wide range of diseases.

We have in our files many hundreds of clinical, chemical and case reports, together with testimonial letters and articles published in medical journals with clinical testimony supporting the various claims made for Atomidine.

Following are brief excerpts from typical expressions of the Medical and Dental professions.

Atomidine In Dentistry

Atomidine is the remedy of choice wherever a powerful non-irritating antiseptic and germicide is required. In post-operative cases, such as tooth extraction, Atomidine cannot be recommended too highly.

It acts as a hemostatic and is non-escharotic. When applied to the tooth socket in the pure state there is an immediate blanching of the tissues with an arrest of hemorrhage. An almost complete freedom from pain is observed in extraction and oral surgery operations wherever Atomidine is used as a post-operative application. Atomidine stimulates the growth of tissue. Two or 3 days after an extraction and the application of Atomidine, the socket is filled with healthy granulations. Atomidine is a scientifically prepared ethical product of Atomic iodine, endorsed and prescribed by many leading doctors and is the culmination of many years of research work of Dr S. A. Bisey, D.Sc. (Hon.), distinguished scientist and inventor. Since its discovery in 1914, it has been the first and foremost ethical preparation of iodine that liberates Atomic Iodine upon contact with body fluids. It is non-poisonous, non-irritating, stainless, odourless and a water soluble compound, safe for internal administration. Atomidine is manufactured and distributed by the well known manufacturing pharmacists, Messrs. Schieffelin & Co., of New York. In its early years it was known under various names. During 12 years of test period and research work it received endorsement from the medical profession as a recognized product of high medicinal and scientific value and one of the greatest contributions to Materia Medica. This led to the adoption of its scientific name Atomidine (atomic iodine) in keeping with medical terminology, by which name it has been known since 1926. Thousands of doctors in America and other countries have prescribed Atomidine and have reported splendid results in a wide range of diseases.

We have in our files many hundreds of Clinical, Chemical, and Case Reports, together with; Testimonial Letters, and Articles published in Medical Journals, with Clinical Testimony supporting the various claims made for Atomidine. The following are brief excerpts from typical expressions of the Medical, and Dental professions.

Medical Reports Show 96% Favourable Results

Report received from 1241 physicians and dentists shows that out of 18,186 cases of 21 different diseases treated by them, 17,507 (96%) were reported with favourable results thus proving the efficacy, reliability and sterling merits of Atomidine.

Physicians And Surgeons Reports Therapeutic Effects

"In the Atomic form iodine exerts in the system its maximum of beneficial effect, witout the irritating, depressant and escharotic action prominent as by results of the molecular form-tincture, or salts of iodine." - in Report 2118.

"Atomidine has given me gratifying results both through its external application and internal use. Why should I not endorse and recommend Atomidine to all?" - in Report 2258.

"It is the most satisfactory germicide and antiseptic that has ever been produced up-to-date. It has the peculiar and valuable property of not only sterilizing the ordinary pus organisms but the Anaerobic type as well. It has the individual property of deep penetration and most valuable property of actually stimulating cell repair. First and foremost a water-soluble iodine. This is entirely a new accomplishment in the field of chemistry. Liberating as it does the true element in an Atomic state, makes it possible for the first time in the history of medicine to utilize the basic element in the purest known form for internal administration." - in Report 117.

"There is no doubt about the Excellence of Atomidine. In fact I am using it in the treatment of so many different diseases with such satisfactory results that it seems to prove to be almost a cure-all. But there is no argument against facts." - in Report 2220.

"Many preparations on the market kill disease germs but play havoc with the body cells. This we find impossible with Atomidine. It is a triumph of biological science and one of the greatest contributions to Materia Medica." - in Report 1942.

"Having had a tremendously wide experience with antiseptics and germicides, I feel qualified to make this positive statement; to wit; that there is no such preparation existing today, that meets with the requirements of modern surgery so well as Atomidine. It has the peculiar property of activating the growth of normal tissues." - in Report 1944.

Gastro-Intestinal and Urinary Disorders

"Out of 540 Gastro-Intestinal cases, 494 with favourable results. Out of 691 Urinary Disorders, 614 with favourable results." - in Medical Report 1559.

"Good results in several cases of Gastro-Intestinal Disorders." - in Report 1693.

"Stomach Ulcer cases are all well. Full recovery. Quite a feat as those were old ones and medical men were quite helpless." - in Report 1976.

"Satisfactory in Gastro-Intestinal Disturbances." - in Report 2089.

"Another intensely valuable property is its undoubted active therapeutic effect in the control of putrefactive and fermentative conditions of the Castro-intestinal tract." - in Report 117.

"Gastro-Intestinal Cases cured with Atomidine." - in Report 2258.

"Stomach Troubles responded liberally as well as Urinary Disorders." - in Report 127.

"Genito-Urinary Infections out of 320 cases, 84 Cured, 216 Improved." - in Hospital Report 1935.

"Diseases of Urinary Tract, I cured about 20 with very nice results." - in Report 1934.

"As a Urinary antiseptic in the presence of inflammation in the urinary tract, Atomidine, I find superior to any others." - in Report 1945.

High Blood Pressure

“Out of 1029 cases decided, 978 with favourable results.” - in Report 1559.

“I have found a medication to reduce blood pressure.

A woman 80 years of age, blood-pressure 210, Atomidine given in 10 minim doses 3 times daily for 5 days.

The blood-pressure was reduced to 160, 5 more days effected a reduction to 148.” - in Report 190.

“Find it does not produce iodism. Use it myself for high blood-pressure. Other iodine preparations give me iodism very quickly.” - in Report 1581.

“Woman age 50 with a pressure of 285. Took it 3 times to make sure.

Placed on 15 drops of Atomidine 3 times a day for 2 weeks.

The pressure went down to 240, patient much improved. Man age 65 with a pressure of 180 - placed on Atomidine. Pressure down to 150, patient doing very well.” - in Report 1162.

“Found it very reliable drug in controlling high blood-pressure.” - in Report 115.

“A woman complaining of violent headaches, dizziness, fatigue on slightest exertion. On taking the blood pressure, imagine my alarm at finding it was 280.

Today, only 3 weeks later, she was helping her husband in the field.

Her husband is overjoyed and she herself is singing my praises to the neighbours.

What did I give her?

Ten drops of Atomidine in half a glass of water 30 minutes before meals.” - in Report 1688.

“Case of Hypertension with considerable discomfort from dizziness and pounding in the head. These symptoms have improved. The blood-pressure dropped to 150 and this has been with no gastric distress.” - in Report 1742.

Iodine Deficiency Diseases

“Out of 583 cases decided, 558 with favourable results.” - in Report 1559.

“I use Atomidine always as the remedy of choice where Iodine is Indicated in deficiency diseases. The action is prompt.” - in Report 1945.

“This form of iodine is without question our most valuable therapeutic agent for the prevention and treatment of Goitre.” - in Report 117.

“Had wonderful success with Atomidine. Good results for Goitre.” - in Report 1778.

“Use Atomidine regularly for furnishing iodine to the system.” - in Report 1943.

“Used Atomidine when iodine is called for. It is clean, no stain, and effective.” - in Report 2022.

“Excellent results in goitre of young girls.” - in Report 2031.

“All cases where iodine is indicated. Works wonders with children.” - in Report 2106.

Malaria And Tropical Fevers

“Malaria Fever, intermittent type.

Troubled with it years before. Gave Atomidine. In 3 weeks no trace of malaria remained. I gave all blood tests. No return of the ailment.” - in Report 1959.

“Malaria: Treated 40 cases. Your discovery is going to make a revolution in the world as the best remedy for Tropical Fevers.” - in Reports 252 and 1934.

“Atomidine is an asset to the tropical medicine. Its virtues are unsurpassed in treating various tropical fevers.” - in Report 1936.

“Male patient, tertian malaria proven by slide. Contracted malaria 18 years ago. He was treated in the American Hospital but suffered relapses.

Since the time he took Atomidine he is free from fever.

Took 3 more slides, all negative.

The last 2 years he never had fever for 1 day.” - in Report 1937.

“Successfully tried several cases of malaria influenza and other fevers.

Temperature becomes normal within 24 to 48 hours without causing any harmful or depressing effects on the heart or reducing the vitality of the patient.” - in Report 1942.

“Dengue fever, blackwater and all types of malaria are brought under control within 48 hours. Fever in general disappears after the 3rd day.

The general weakness following all fevers disappears within a week. In no case gastrointestinal symptoms found to appear as in the case of Quinine in fever.”- in Report 1967.

“In fevers it is very fine and the improvements are soon noted. It is non-toxic and does not leave any untoward after effects to be feared.” - in Report 127.

"Influenza: 53 Cases treated, all with Favourable Results." - in Report 1559.

"A case of 3rd day chills. Gave Atomidine 4 weeks ago. Not had any more chills and feeling fine. So a great discovery, I think." - in Report 2154.

"Found Atomidine superior to Quinine, as it promptly checks chills and brings the fever under control within 24 to 48 hours and there is a complete absence of undesirable symptoms associated with the use of quinine. Atomidine is well tolerated by the system." - in Report 2159.

"Used Atomidine in obstinate cases of malaria fever with splendid results." - in Report 2178.

"Results have been very gratifying in the treatment of malaria. Treated 5 cases. In each case temperature dropped to normalcy in a few hours and had no return of chills or fever." - in Report 2164.

"Used Atomidine in 4 cases of malaria with splendid results. All symptoms subsided. Appetite greatly improved. Blood smears negative for malaria." - in Report 2181.

"Pleased at results obtained in treating malaria with Atomidine. Your preparation will have wide field of use in malarial conditions." - in Report 2221.

"Used Atomidine in a case of tertian malaria, with splendid results. Blood negative on all forms in 5 days." - in Report 2230.

Venereal Diseases

"Neisserian infections; 58 cases under observation, 28 cases show negative smears, decrease in the amount of discharge, disappearing of erosions, 11 cases show no improvement as to the amount of cervical discharge although smears were negative, 16 cases left the hospital." - in City Hospital Report 1645.

"Tried Atomidine over Venereal patients and found a really responsive product. See no reason why every practitioner cannot get similar results." - in Report 2134.

"In chronic gonorrhoea cases of both sexes improved immediately the vital resistance of the patient, alleviating at once the genito-urinary symptomatically. Good benefits results in cases of syphilis in its 2nd and 3rd state." - in Report 1655.

"Urethral Gonorrhoea, associated with streptococci infection. Atomidine was given internally. Injections were given in Urethral tract. In 3 weeks the case was negative to both gonorrhea and streptococcus." - in Report 2166.

"Found Atomidine an excelled in the treatment of Syphilis. Treated 50 cases." - in Report 2159.

"Using Atomidine in preference to K.I. In Lues (syphilis)." - in Report 1594.

Eye, Ear, Nose and Throat

"Throat Infections: Out of 1,155 cases decided, 1,122 with favourable results." - in Report 1559

"5 to 10 drops of Atomidine put into one ounce of water makes an excellent collyrium (eye lotion). I have used it on my servant girl in a severe inflammation of both eyes - of uncertain origin and diagnosis - that had resisted several kinds of treatment during 3 months.

Above mentioned collyrium put into her eyes 2 drops 2 or 3 times a day. It had completely cleared up in 1 week." - in Report 2180.

"During the past 5 years I have been trying different drugs to shorten the purulency of a supperating middle ear.

Recently I have been trying Atomidine in a preparation which produces nasent iodine. I used 1/2% in oil. (A special preparation of Atomidine in oil, made according to the specifications of a leading Nose, Ear and Throat Specialist, is available on request). The strength not only did not give pain but was distinctly beneficial. A series of cases was subjected to it with cures in 1 week to 2 weeks. Tried it with maxillary antritis (Inflammation of the maxillary sinus) cases with striking benefit.

Whatever specific action Atomidine has, antiseptic or cytefacient is not known, but there is a cessation of the discharge and the local protection is increased." - in Ear, Nose and Throat Clinic, Report 1741.

> *"Sinus infection: Nothing seemed to help except Atomidine, and this is an unusually difficult case where everything failed." - in Report 1953.*
>
> *"Fine remedy for sinus trouble. I use a lot of it." - in Report 1635.*
>
> *"I used it several times on a chronic sinus where tonsil had been removed. The sinus is apparently well. I have cured 2 cases of chronic otorrhea with diluted solution." - in Report 2259.*
>
> *"Worked very well." - in Eye and Ear Infirmary, Report 1859.*

"Pharyngitis, and Tonsillitis cases under observation, 52.
In 47 cases improvement occurred within 3 to 5 days with subsidence of pain, fever and congestion. The solution was employed in swabbing the throat thoroughly." - in City Hospital, Report 1687.

"Found satisfactory in the treatment of sinus infection, acute and chronic." - in Report 2052.

Bronchitis and Asthma

"Had chronic Bronchitis for over 7 years.
Tried many doctors and remedies, with no success.
Took 3 bottles of Atomidine. I am now well.
No signs of old trouble since.
Recommend it to all my patients. Worth all that is claimed for it." - in Report 1947.

"Bronchitis: 15 cases treated, all with favourable results." - in Report 1559.

"Had most excellent results in all the treatment of Asthma and Bronchitis." - in Report 2254.

"Chronic Bronchitis case responded nicely after taking Atomidine." - in Report 2259.

"Very good success in relieving a case of Bronchial Asthma." - in Report 289.

"Good results in Chronic Bronchitis." - in Report 1565.

"Fine for Acute and Chronic Bronchitis." - in Report 2064.

"Found satisfactory in the treatment of Bronchitis and Asthma." - in Report 2077.

"Atomidine three times daily stopped persistent cough of long standing." - in Report 2165.

Arthritis and Joint Diseases

"We have used Atomidine and found it satisfactory in every way." - in Hospital for Joint Diseases, Report 124.

"Arthritis: out of 265 cases, 53 cured, 185 improved." - in Sailors Hospital, Report 1935.

"Tried on Arthritis patient who had right knee and wrist swollen, and very painful on least movement.
In 3 days she could move the knee and wrist a lot better and less pain." - in Report 2157.

"I have found Atomidine unexcelled in the treatment of Rheumatism, treated 50 cases." - in Report 2159.

"Atomidine has helped me personally - the old rheumatic condition gave way to your 'Water Soluble' iodine compound." - in Report 130.

"Got excellent results in a case of Arthritis of the knee." - in Report 197.

"Found satisfactory in the treatment of Chronic Rheumatism." - in Report 2086.

Acute Infections

"Out of 515 cases decided, 483 with favourable results." - in Report 1559.

"Severe case of Ivy Poisoning. Found it to be almost a specific." - in Report 226.

"Case Reports:

1. "Had been in a local hospital for 7 months with streptococcus infection.
Draining pus from 7 incisions.
Prescribed Atomidine.
In 2 months most of the wounds healed.

2. Severe infection of toe nail, septic poisoning set in.
Gave Atomidine internally.
In 4 days the infection was cleared up.

3. Leucorrhea discharge which had resisted every form of medicine.
Prescribed Atomidine douches.
In 2 weeks discharge stopped and the female organs resumed their natural position." - in Report 206.

"I have prescribed Atomidine in many hundreds of cases as a preventive and prophylactic in periods of epidemics with marked benefits. As an abortive in infections it has marked and rapid inhibitory action, proving beyond the least doubt that it has decided internal antiseptic or germicidal action." - in Report 1945.

"Giving it first place, not only in first aid but think of nothing else when I treat infections. It is really wonderful." - in Report 193.

Additional Clinical Data

There are many conditions, not mentioned here, for which Atomidine has been used with good results and due to the fact that it is non-poisonous and non-irritating it has greatly extended the scope of iodine therapy, particularly for internal treatment. **In our files there are several medical Reports as to the satisfactory use of Atomidine in:**

1. **Cancer**
2. **Leprosy**
3. **Epilepsy**
4. **Tuberculosis**

A preliminary investigation as to the use of Atomidine in intramuscular and intravenous injections has been productive of the most gratifying evidence and further research is being conducted for the purpose of putting the preparation in suitable ampules for injection therapy. Further information or copies of medical reports will be gladly submitted on request.

Atomidine Ointment

The valuable properties of Atomidine are incorporated in Atomidine ointment which renders them available for topical applications. Atomidine ointment is a preparation of genuine therapeutic merit that will meet exacting clinical requirements. It is penetrative, non-irritating, emollient, effective in both aerobic and anaerobic infections, it promotes cell metabolism and repair and relieves pain and congestion. Physicians will find it of real value for digital examination of rectum and the female genitalia.

Medical Reports

> ***"First and second degree burns; healing was rapid. Case of Ringworm; removed the itching. Case of Blepharitis; reduced the swelling and itching of the eyelids."*** *- in City Hospital Report 1654.*

> ***"3 Cases of Arthritis Treated with ointment are having very satisfactory results.***
> ***A rheumatic knee greatly relieved and 4 cases of Neuritis are yielding to treatment."*** *- in Sanitarium Report 67.*

> ***"We have given Atomidine good trial and found same very successful. Its merits in skin irritations, burns, boils carbuncles, etc., are unsurpassed."*** *- in Sanitarium Re. 128.*

*"**I have had extensive experience with Atomidine during the last 3 years. It exerts a very deep penetrative and active germicidal effect.** It has the individual and peculiar power of relieving local congestion. **One of the most valuable attributes is its definite ability to stimulate the growth of tissues. I believe it is the most efficacious preparation in the field of medicine for the treatment of sun-burn. I have seen a number of very severe cases of second and third degree burns in which the relief of pain, subsidence of inflammation of the tissues and activation of Repair is truly most remarkable."** - in Report 118.*

*"Used ointment in the case of a scald extending the entire length of the right leg, 2 to 4 inches wide. The skin was entirely denuded. There is a complete healing with natural epidermis and no scar tissue. **I have never seen a scald of such area and death heal without scar tissues or contraction."** - in Report 119.*

*"**Atomidine ointment is always used for the treatment of Burns, Abrasions, Cuts, etc., to the exclusion of all other ointments as we find it superior to any others, for its healing, soothing, antiseptic, and tissue building qualities."** - in Report 1943.*

Atomidine in Dentistry: Dentists Reports

Mouth Diseases	**Cases**	**Favourable Decided Results**
1. Pyorrhea	2,296	2,145
2. Vincent's Angina	884	821
3. Post-operative Cases	8,787	8,714
4. Gingivitis & Antrum	27	27
Total:	11,994	11,707

Hospital Report:

"Pyorrhoea; 8 cases improved with pure Atomidine. Vincent's Angina; 2 cases cleared upon application of pure Atomidine. Smear for spirilli was negative.

Mercurial Stomatitis; 5 cases, cleared up local application." - in Report 1649.

Sanitarium Report:

"Used it in several cases of Pyorrhoea and it has been very beneficial." - in Report 67.

Dental Clinic Report:

"Large number of cases of Pyorrhoea, Vincent's Angina, antrum and post-operative pain were successfully treated." - in Report 27.

Dental Surgeons

> *"Selected cases of Pyorrhoea usually difficult of treatment. Three of the 5 cases entirely cleared of pus within 10 days. In the treatment of putrescent root canals, had considerable success. It is the best oral germicide I have used." - in Report 38.*

> *"23 case reports on Pyorrhoea cases from a Dental Surgeon pyorrhoea specialist. Every case was successfully treated." - in Reports 79 to 101.*

> *"Record of 5 cases of Pyorrhoea chosen because most advanced so would be a severe test for your product. The results most surprising and gratifying. No reason why every practitioner cannot get the same results with it." - in Report 58.*

> ***"Very quick cure for most cases of Pyorrhoea.*** *After 3 injections pus flow stopped, soreness and irritation disappeared, and raped formation of new tissues. Heartily endorse it to the members of the profession as our best remedy to date." - in Report 24.*

"Wonderful preparation, for all forms of mouth infections. I would like to see a Pyorrhoea case that I cannot cure after making diagnosis." - in Report 70.

"Using it for 2 years, found it an exceptional drug in the treatment of Pyorrhoea and various infectious diseases." - in Report 120.

"I found your preparation, all you claim for it. Using it nearly every day." - in Report 306.

"I find it my best friend in all inflammatory conditions of the oral cavity and cannot do without it. It seldom fails in treatment of Pyorrhoea, Vincent's and Root Canal Work." - in Report 105.

"Use it almost hourly in the treatment of Pyorrhoea, Vincent's Angina and find it the most pleasing germicide." - in Report 1712.

"I find it indispensable in post-operative work." - in Report 233.

"Surely it is a good remedy for use right after an extraction case. It seems to work miracles. It minimizes the usual post-operative inflammation and the process of healing is much accelerated." - in Report 1667.

"I want to see the dentists of this country accept Atomidine as a positive cure for Pyorrhoea." - in Report 46.

"Most efficient drug, I have ever used. Worthy of a place in dentist's medical cabinet. I would not be without it." - in Report 1722.

"Find satisfactory in the treatment of dry sockets" - in Report 2150.

"It will cause healthy granulation to start in slow healing sockets." - in Report 2251." - in "Atomidine in Medicine", Druggist Circular, 7 March 1933.

> *"Observations by the Vienna surgeon Professor Schmidt, which took place over decades in his practice,* ***studies in the last 100 years have shown consistently that people who experienced childhood diseases accompanied by fever were less likely to suffer from cancer in later life."*** *- Anita Petek-Dimmer, founder of Aegis Switzerland, in "Does systematic Vaccination give health to people?", 2002.*

Artemisia Annua in the Cure & Prevention of Malaria and Very Likely Other So-Called Diseases

"Artemisinin from the plant Artemisia Annua (A. annua) L, and used as artemisinin combination therapy (ACT), is the current best therapeutic for treating malaria, a disease that hits children and adults.

Traditionally, **A. annua was used by the Chinese as a tea to treat Fever.**

More recently, investigators have shown that tea infusions and oral consumption of the dried leaves of the plant have prophylactic and therapeutic efficacy.

The presence of a complex matrix of chemicals within the leaves seems to enhance both the bioavailability and efficacy of artemisinin.

Although about 1000-fold less potent than artemisinin in their antiplasmodial activity, these plant chemicals are mainly small molecules that include other artemisinic compounds, terpenes (mainly mono and sesqui), flavonoids, and polyphenolic acids.

In addition, polysaccharide constituents of A. annua may enhance bioavailability of artemisinin.

Pharmacokinetics of deoxyartemisinin, a liver metabolite of artemisinin, was more inhibited in infected than in healthy mice.

In healthy mice, artemisinin serum levels were > 40-fold greater in dried leaf fed mice than those fed with pure artemisinin.

Human trial data showed that when delivered as dried leaves, 40-fold less artemisinin was required to obtain a therapeutic response compared to pure artemisinin.

Considering that for more than 2,000 years this plant was used in traditional Chinese medicine for treatment of fever with no apparent appearance of artemisinin drug resistance, the evidence argues for inclusion of affordable A. annua dried leaf tablets into the arsenal of drugs to combat malaria and other artemisinin-susceptible diseases.

The most clinically definitive study to date of pACT efficacy was conducted at the International Centre of Insect Physiology and Ecology (ICIPE) Mbita Field campus, Suba District, in Western Kenya.

This was a collaborative project between ICIPE and Kenya Medical Research Institute and was an open-label, non-randomized clinical trial mainly targeted to assess efficacy, safety, and tolerance of increasing doses of pACT delivered as tablets. Leaves were harvested just before flowering, dried for approximately 3 wk under shade, then crushed, powdered, homogenized, and pressed into 500 mg tablets under ambient temperature. Tablets were robust with no excipient required. Using HPLC with diode array detector, analysis of hexane extracts of randomly selected batches of 100 tablets showed artemisinin content of the tablets was consistent at approximately 3.7 mg per tablet.

The 4 cohorts of the trial each had 12 consenting patients aged 15–56 years (average 23.42) with P. falciparum malaria.

Based on Giemsa-stained blood smears counted against 200 wbc, parasitemia was 0.02%-4% and hemoglobin levels > 8 mg/dL.

Each cohort received one of 4 increasing numbers of A. annua tablets, ranging from 2–5 tablets twice on day 1, followed by 1–4 tablets twice daily for the next 5 days. A week following the treatments, 3 patients scattered throughout different cohorts showed re-appearance of parasites in blood smears; however, all doses were effective in clinical and parasitological regression of malaria, with 9%-20% recrudescence at day 28 and no measurable toxicity.

Conclusions

Evidence is mounting for the therapeutic efficacy of the use of dried leaves of A. annua, pACT, to treat malaria and possibly other diseases.

The complex mixture of antiparasitic compounds in the plant seems to account for its therapeutic activity with animal and human trials supporting this claim. It is also clear that the cost of using pACT is a fraction of that for any other current or emerging antimalarial therapeutic.

Likewise, the recent evidence of persistent and/or asymptomatic malaria suggests that a more prophylactic approach to malaria using pACT or even **A. annua tea may be warranted.**

Considering that for more than 2,000 years this plant was used in traditional Chinese medicine for treatment of Fever with no apparent appearance of artemisinin drug resistance, taken together the **cumulative evidence argues for inclusion of pACT into the arsenal of drugs to combat malaria, and very likely, other diseases."** - in "Dried-leaf Artemisia annua: A practical malaria therapeutic for developing countries?" , World J. Pharmacol., 9 December 2014.

The Beneficial Effects of Fever

"The use of fever to treat disease, termed pyrotherapy or pyretotherapy, is a concept that has existed for centuries.

Hippocrates is credited as being the first to make this observation when he noted the beneficial effects of Malaria on Epilepsy.

Galen was the first to note that feverish states had a beneficial effect on psychiatric illness, and Pinel, Esquirol, Briquet, and Maudsley also described similar phenomena. However, pyrotherapy did not reach mainstream psychiatry until the early 20th century, thanks to the Nobel Prize winning work of Julius Wagner-Jauregg, as well as contributions from others.

Wagner-Jauregg first experimented with streptococci, tuberculin, and staphylococci but, because of inconsistent results, he shifted his focus to malaria, specifically targeting its effects on the treatment of General Paralysis of the Insane (GPI), now commonly known as Neurosyphilis.

Wagner-Jauregg's early experiments involved inoculating patients with GPI with blood from individuals with confirmed malaria.

He then allowed the patients to undergo several attacks of fever before treating them with quinine to cure the malaria.

These initial experiments produced very promising results, and malaria therapy was rapidly adopted as the treatment of choice for GPI and other psychotic states.

Wagner-Jauregg's clinic treated over 1,000 patients with GPI with malarial pyrotherapy, with approximately 60% of them experiencing remission to varying degrees." - in "Pyrotherapy for the Treatment of Psychosis in the 21st Century: A Case Report and Literature Review", Journal of Psychiatric Practice, September 2016.

Pyretotherapy In The Treatment Of West's Syndrome

"West's Syndrome is characterized by generalized Myoclonic Spasms, Arrest of Psychomotor Development, and a Hypsarrhythmic Electroencephalogram.

It is a difficult condition to identify clinically and to treat effectively.

The characteristic Electroencephalogram tracing makes the diagnosis definitive.

The synonyms most frequently used are:

1. **Infantile Spasms with Hypsarrhythmia**
2. **Myoclonic Encephalopathy with Hypsarrhythmia**
3. **Salaam Spasms**
4. **Massive Spasms**
5. **West's Syndrome**

This condition was (first) described by W.J. West in "On a Peculiar Form of Infantile Convulsions", Lancet, 1841.

Four cases of West's Syndrome (generalized myoclonic spasms, arrest of psychomotor development and hypsarrhythmia), are reported.

In these cases, High Fever (pyretotherapy) induced by TBA Vaccine (typhoid and paratyphoid) was used. **Within the next 8 days following treatment with pyretotherapy, the clinical conditions of these children showed a gradual decrease of generalized myoclonic spasms and an improvement of their mental and neurological status. The follow-up electroencephalograms showed cessation of the hypsarrhythmia. The study of these cases and their electro-clinical correlates suggests that pyretotherapy is a useful procedure in this extremely disabling condition."** - in "Pyretotherapy as Treatment in West's Syndrome", Clin. Electroencephalogr., 15 July 1984.

Effects of Atmospheric Electricity

"At a recent meeting of the California Academy of Sciences, C. D. Gibbes, C.E., remarked that **when surveying during our north winds, in the San Joaquin valley, the electrical disturbance was so great as to cause the needle of his compass to fly up against the glass and become useless during the first part of the day when in the field; but that if he took the same compass into a warm moist room, it again acted normally. Engineers in Santa Clara and Calaveras counties report the same action and dip of the magnetic needle during the prevalence of our dry northers. Dr Harkness said the northers affected the human skin. They caused an uneasiness, which results in dog fights, runaway horses, cross dispositions, pallid faces, etc.**

Dry asthenosphere is a perfect non-conductor, but all moist plants and animals, as well as men, then become so many miniature lightning rods.

The nerves are at such times continually irritated by a constant succession of tiny blows, like telegraphic ticks, against the nerve centres. They contract and produce a congestion of the organs; the blood becomes turbid, while kidneys, liver, and lungs all suffer. Dr Henry Gibbons, thought this electric action more subtle than from any apparent mechanical evolution of from friction of the passing wind over the surface of the earth.

He said all persons felt cold, for it drove the circulation from the surface to the interior of the body, as Dr Harkness so beautifully described 20 years ago.

Its effect on certain diseases has been marked. The death rate has been claimed to increase at such times. He had a patient whose eyes always blinked and snapped during a wind, even in a warm, moist room entirely protected from direct contact with the wind. Dr Harkness said we were always surrounded by Electricity, but did not perceive it until its equilibrium was destroyed, when it became manifest. In some parts of India silk underclothing is necessary to comfort, at certain altitudes, during dry north winds, and in other parts no relief is found in this clothing." - in "Scientific American", 11 February 1882.

The Toxic Basis of Neural Disease

Section 1

Remarks on the Relation of the Auto-Intoxications to Neural Disease

"At a previous meeting it was my privilege to indicate that certain factors are at hand for the creation of **a new epoch in the evolution of the Pathogenesis of Nervous and Mental Diseases**; especially of the latter.

1. The first and most important of these factors is the precise and definite status which the anatomy of the nervous system attained through the investigations of the past decade by the Golgi methods; the establishment of the neuron theory in particular leads to a definite understanding of the pathology and physiology of the nervous system.
2. A second great factor in this new epoch of neuropathology is the application of the modem doctrine of cytology and its technical methods of research to the investigation of the problems in nervous and mental diseases.
3. A third factor is a realization of the absolute necessity of correlating the nervous system with other organs and tissues in the body in studying the operation of the fundamental and general somatic pathological processes in the nervous system.

I called your attention to the fact, that the progress of the past 10 years in bacteriology and physiological chemistry have gone far toward demonstrating that the great majority, in fact, if not most, of the Processes of Disease in General Are Due To Toxic Substances in one form or another.

It is my profound conviction that in the course of time, the application of this toxic theory of disease to the nervous system is destined to clear away much of the present vagueness and mystery of the causative agents and pathogenesis of mental diseases.

The brain is involved like any other organ of the body, in these general toxic or somatic diseases, and many of the insanities (excluding those of psychic origin) are but the expression of the later disturbance of the functions of the brain dependent upon changes in the nerve cells produced by the action of toxic substances. The relation of the dependence of changes in the nervous system upon general somatic diseases is often thoroughly masked; there may be a long lapse of time between the occurrence of the general body disease, and the appearance of the mental or nervous symptoms due to the damage wrought on the brain, by the toxic substances associated with the acute general illness.

The lapse of time may be so long that the relation between the 2 events is lost track of.

Then, too often have the mental or nervous symptoms been made to appear as due to a pathological process originating de novo in the nervous system, or as an independent, sui generis disease process in the nervous system.

In other cases of neural diseases the general somatic toxic factors act in an intermittent (Epilepsy) or chronic manner (tabes melancholia); these toxic factors (Auto-Intoxications for example), operate slowly, insidiously and persistently. In such instances, associated with chronic parenchymatous degeneration of the nervous system, these somatic causal factors are generally most subtle, unapparent and unobtrusive. Then again the tendency has been to regard the pathological processes in the nervous system as something peculiar to and limited to the neural tissues and as independent of the few great primary pathological processes which alike underlie all forms of disease in all parts of the body.

I may divide the pathogenic toxic substances into 5 groups:

1. **Auto-toxic Substances;**
2. **Bacterial Toxines;**
3. **Combinations of 1 and 2;**
4. **Extrinsic Poisons; and**
5. **Protozoal Poisons.**

Certain general remarks on this classification of pathogenic poisons are necessary before proceeding with the subject of auto-poisons in neural diseases.

Protozoal poisons are only mentioned in this list and can not be considered to any extent in the general text, for too little is known about them or their pathogenic action on the body. **In the one well known manifestation of protozoal poison, malaria, there are decided expressions of a participation of the nervous system in the general poisoning of the body.**

We do not know as yet how many congeners of malaria there may be.

If protozoa are responsible for small-pox, (syphilis) and the exanthem group, a suspicion which I strongly entertain, although merely on the slender tenure of elimination of other classes of poison, **the share of protozoal poisons in the toxic basis of neural disease is profoundly important.**

That the exanthemata are associated with poisons is certain.

Clinical observation shows most decided Poisoning of the Nervous System.

The exanthemata as a group work much damage on the nervous system which by all analogy with other poisons, as will be seen later in this text, ought to be expressed in acute parenchymatous degeneration of the nervous system.

In the case of small-pox for example, there are a variety of permanent sequelae of the nervous system which indicate that the poison may be so severe as to cause an acute degeneration of the nervous system of a more or less destructive determination.

Since the poisons of the exanthemata can not be identified with bacterial, extrinsic or fungus or auto-poisons, and since it is justifiable in science to accept the simplest hypothesis which will explain the most facts, the theory of the protozoal origin of the exanthemata at the present seems thrust upon us.

The question as to what extent the poisons of protozoal diseases are due to the synthetic compounds composing the protozoa themselves, or to the analytical substances which are created out of the tissues by the destructive action of the protozoa, is at present indeterminable.

If animal parasites excrete poisonous substances or create secondary analytical toxic products out of the tissues they infest, a class of pathogenic parasitic poisons should be recognized. If, on the other hand, animal parasites damage an organ so that its chemical functions are interfered with, and a poisoning results, this should be ascribed to an auto-toxic substance, and not a parasital poison.

We know enough, of the action of bacterial toxaemias to be sure that they must frequently concomitantly engender auto-toxic substances.

Hence the third class of poisons is a practical one and has a more or less definite basis for its existence. **The first group of these poisons (auto-toxic) merits much consideration because it will probably come here long to be recognized as a factor of great importance in the production of mental and nervous diseases.**

As yet, however, we are but on the threshold of our knowledge of auto-intoxications; only comparatively recently have a number of diseases been wrested from the mysterious domain of the old humoral doctrine of disease and placed in the autotoxic category; and undoubtedly many more obscure diseases, especially of the nervous system, are to be added to the list. It is more appropriate at present to indicate the confines of auto-poisons as a separate group, than to attempt a definition of auto-intoxication. It would seem comparatively simple at first glance to define the auto-intoxications from other forms of poisoning, by saying that this group of diseases is due to the action of poisons created within the body by the somatic chemical agencies. But all forms of disease are the parallel expression of changed or perverted chemical processes of the somatic cells or of chemico-morphological changes in these cells, and this qualification of auto-intoxications does not clearly individualize them from the agency of other groups of poison.

The action of the chemical forces of the body are often most intimately associated with, or modified by, agencies other than those residing exclusively in the tissues themselves, both in health and disease, especially the latter.

In malaria the secondary toxic products induced in the blood by the action of the haematozoa would appear to be the predominating toxic agents rather than the substances which compose the bodies of the haematozoa.

In the gastro-intestinal tract the distinction between true auto-toxic substances and bacterial toxines is still more difficult. This is a common meeting ground for both sets of poisons in both health and disease. In the first place, the normal physiological role of bacteria in the process of digestion in the gut is apparently attended with a production of toxic agents. While these analytical digestive or putrefactive products in the gut are really bacterial poisons, they are habitual normal constituents of the body, and are not potential poisons unless absorbed by some error in the functions of the organs ordained to dispose of these latent poisons. I would, therefore, call these poisons, while latent, bacterial toxines, but when they become potential and gain access to the

circulation through errors in the process of absorption, they are to be termed auto-toxic substances. This is entirely consistent with the group of auto-intoxications due to the disturbance of the function of an organ with or without anatomical changes, and includes such gastro-intestinal auto-intoxications in that group.

Disturbances of Nutrition

The question is also pertinent if what is meant by the phrase "Disturbances of Nutrition" as a factor of disease is not made clearer by considering that many of such disturbances are in part at least forms of auto-intoxications.

"Disturbances of Nutrition" must imply modified or abnormal changes in the body cells and auto-poisons suggest themselves as agents which would very often cause such cellular chemical changes. As a tentative definition of auto-intoxications, I would say that the primary intoxications are due to the action of poisons newly formed or retained within the body by the purely somatic chemical agencies, and that secondary auto-intoxications are due to the action of poisons which result from the deprivation of the body of some indispensable chemical constituent. **Retained poisons include the transformation of latent into potential poisons in the gastro-intestinal tract or elsewhere in the body.**

When it is remembered that the whole animal body is composed of the most complex chemical compounds, which are incessantly undergoing new aggregations and segregations; when one recalls the complex chemical elaboration of the secretions, the digestive processes of the alimentary canal, the chemistry of general tissue metabolism and the chemical processes attending the elimination of waste products from the body he realizes vividly the abundant and constant opportunity which the living body affords under various disturbances for the occurrence of auto-intoxications. The dividing line between the harmless derivate of albumen and the severely poisonous tox-albumen is certainly very often most subtle. Apparently a very slight change in the molecular structure of a useful body proteid may cause a transformation to a very severe tox-albumen.

It is not strange in all of this complicated chemistry of the body, that the mechanism goes astray and either **abnormal poisonous chemical compounds are developed, or poisons normally elaborated in the body are not nullified because of derangement of the organs whose function appears to be largely if not wholly for that purpose (liver, thyroid gland), or, by some failure of the eliminative organs, that the retention within the body of normal physiological products of waste assumes such proportions as to become poisonous.**

The profound conviction already expressed that very many examples of Mental, and not a few instances of Nervous Disease Are Caused by the Action of Auto-Toxines on the Nervous System, whether of acute, sub-acute, intermittent, or chronic exhibition, is based upon my studies of the past 4 years of the cytologic changes on the nerve cells associated with poisons generically.

This belief then is founded principally on a morphological basis gained by the following course of studies.

At first the cytologic lesions induced in the ganglion cells by the exhibition of well known poisons of the extrinsic group such as arsenic, lead, mercury and alcohol, the action of which could be controlled and directly governed in animals, were carefully observed with the result of finding that these lesions were essentially the same for all of these poisons and were phases of an acute parenchymatous degeneration of the nervous system. Then similar studies of the minute changes in the internal structure of the nerve cell in **Bacterial Toxaemias such as Typhoid Fever and Diphtheria showed that the neural cellular lesions were essentially of the same type as those observed from the preceding set of poisons.** Moreover extensive cyto-pathological studies of the nerve cells in experimental and human rabies showed again practically the same set of cellular lesions identical with those due to extrinsic and bacterial poisons, namely, phases of an **acute parenchymatous degeneration of greater or less quantitative or topographical distribution in the nervous system, (Plate I).**

Plate I

Illustrations of Acute Parenchymatous Degeneration of the Nervous System

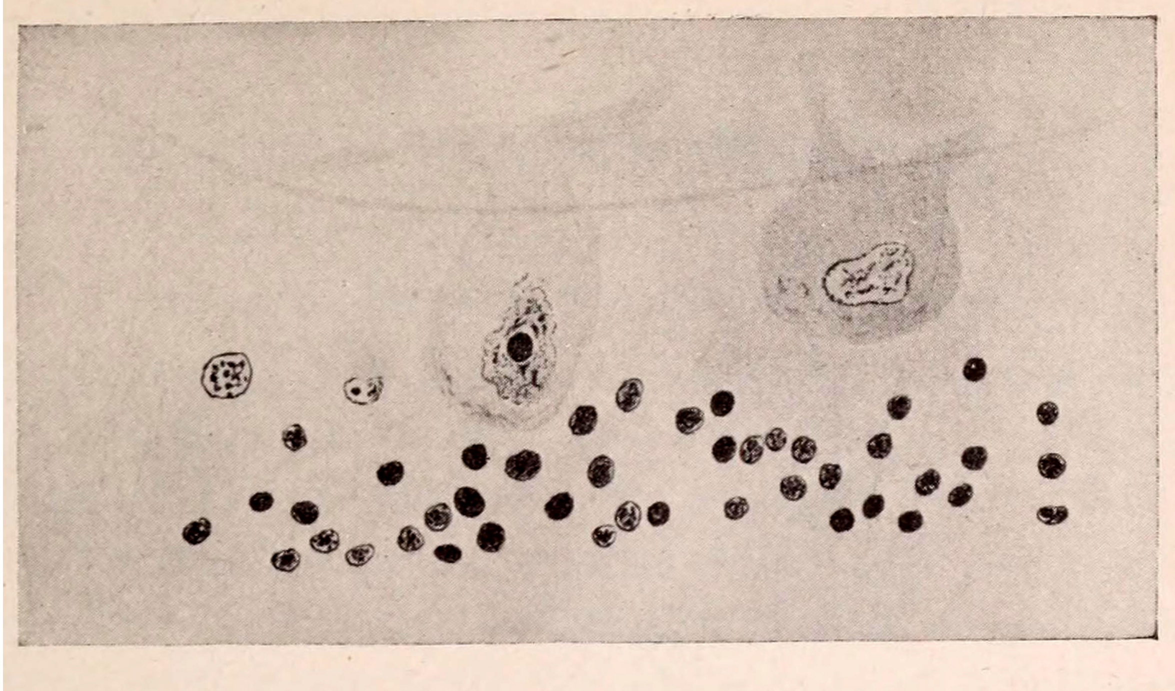

FIG. 1.

Figure 1

Acute degeneration of Purkinye's cells, from the cerebellum of a woman 27 years old, who died of acute alcoholic poisoning a few hours after a violent attack of delirium tremens.

The Purkinye cells have been counterstained with eosine after being stained with a lithium carbonate methylene blue solution, (Van Gieson).

The tissues were fixed in a corrosive sublimate solution and subsequently treated with Iodine. (Paraffine sections Reichert 1-18 Zeiss compensation occular No. 12).

There are changes in both the cytoplasm and nucleus of the cells.

The cytoplasm has lost nearly all of its chromophilic placques; it has a faint, pallid, shadowy outline, and is very difficult to see unless counterstaining is employed after the above modified Nissl solution.

The left hand cell in the drawing shows a more extensive phase of degeneration than the cell at the right.

In the former, the chromophilic placques have not only been dismembered into dust-like granules, but even these have disappeared with the exception of a few partly segregated placques at the neur-axal pole of the cell.

The right hand cell contains a few shrunken placques in the same position, and the rest of the cytoplasm is strewn over with the dustlike disintegrated granules of the chromophilic placques.

In the nucleus the karyotheca is distorted, shrunken and crenated; the karyolymph is more abundant and is radically changed in its chemical constitution.

The karyolymph stains deeply with the methylene blue and appears to be converted into a thick fluid which contains the dust-like segregated particles of the chromophilic placques in solution or suspension.

Thus the nucleus instead of being clear, as in the normal cell stained by Nissl's method, takes a deep diffuse stain and is in prominent contrast to the pale or almost colorless cell body.

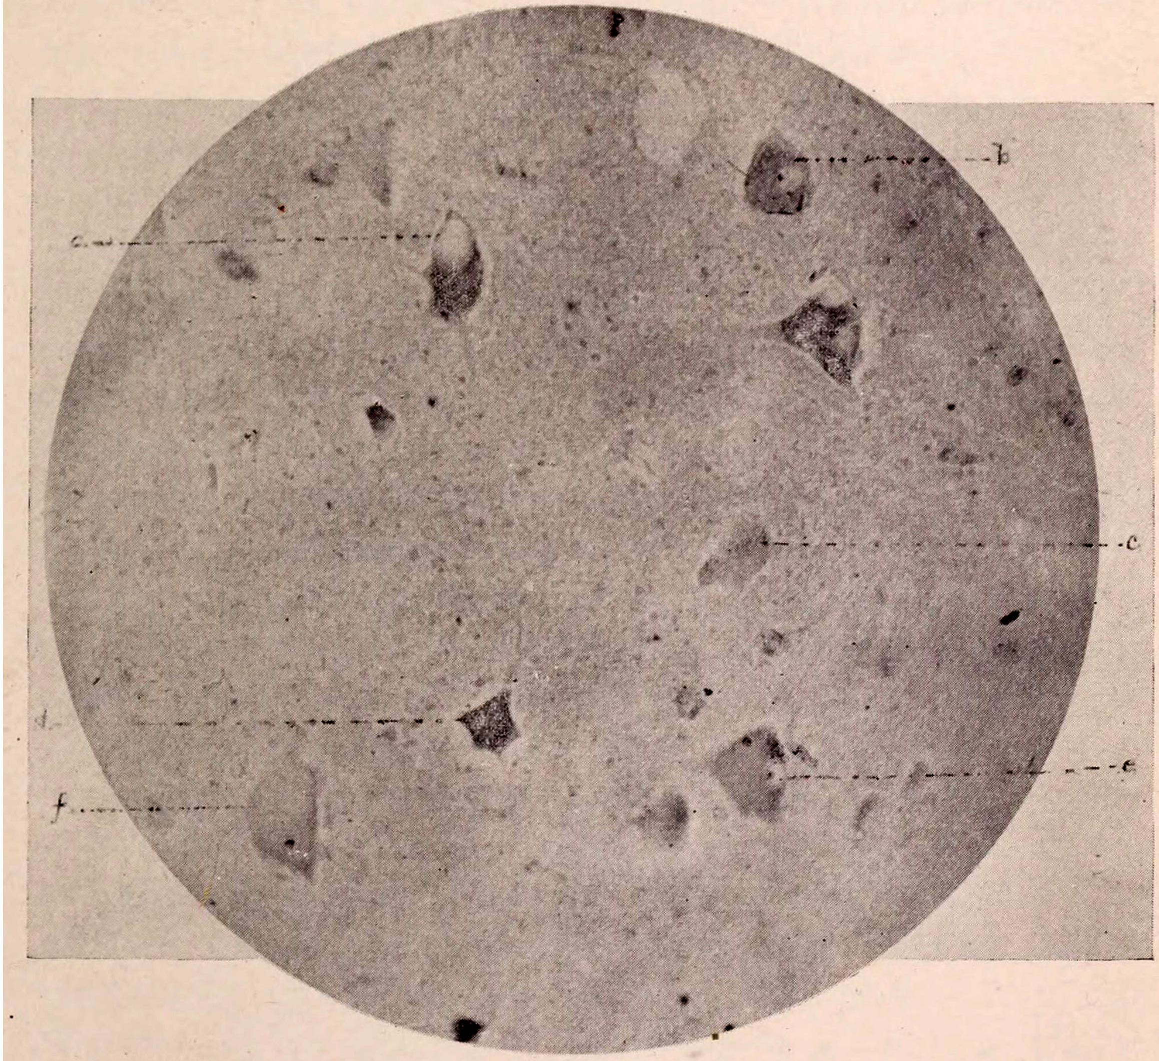

FIG. 2.

VAN GIESON, DEL.

PLATE I.

Figure 2

Acute parenchymatous degeneration in the spinal cord photographed from the anterior horn of the 5th lumbar segment.

The fixing and staining methods are the same as employed in the preceding section with the exception that absolute alcohol is used to kill the tissues instead of corrosive sublimate. The section was taken from a case of peripheral neuritis in which a defective history made it difficult to determine whether disease had its origin from an infection or from an extrinsic poison (alcohol).

There are but 2 normal cells in the whole field, d.d.

All of the others show various phases of the dissolution and disappearance of the chromophilic placques, as in the preceding section, so that the degenerated cells have the same faint, shadowy contrast to the normal cells, e.f.

In 1 or 2 of the cells the degeneration has gone onto an actual loss of substance, and in others there is more or less complete destruction of the cells, c.c.

While it is possible for the majority of these acutely degenerated cells e.f. under a cessation of the poison, and other favourable conditions to regain the normal structure and function, the cells with extensive vacuolation and destruction are damaged forever, and are the cause of the persistent dropped foot and hand in multiple neuritis.

While Figures 1 and 2 are taken from cases of alcoholic poisoning, the cellular changes are not at all to be considered characteristic, specific or peculiar to this form of poisoning.

The changes in these figures are the same as produced in the nervous system by:

1. **Acute Autotoxic Poisons;**
2. **Acute Bacterial Toxaemias;**
3. **Combinations of (1) and (2); and**
4. **Acute poisoning by extrinsic substances.**

These changes are the expression of a chemical reaction between the poison and the substances which compose the ganglion cell.

With the exception of very early and late stages of the degenerative changes in the ganglion cells, the changes in Figures 1 and 2 are quite the same as are to be found in the cortex, cerebellum or other segments of the nervous system when poisoned acutely or sub-acutely by phosphorus, arsenic, carbon monoxide, etc.:

Rabies,
Typhoid Fever, and its related diseases;
Insolation,
Eclampsia,
Malaria,
Pneumonia,
Influenza,
Exanthemata,
Puerperal Fever,
Scarlet Fever,
Measles,
Diphtheria,
Acute Rheumatism,
Pycemia,
Septiccemia, etc.

There are no specific anatomical sets of changes in the ganglion cells to correspond to the action of all of these different poisons, or even to correspond to the 4 great groups of poisons mentioned above.

The effects of all of these poisons on the ganglion cell are manifestations of the same thing — a great fundamental pathological process — acute degeneration with the alternative of regeneration or destruction of the structure and function of the nerve cell.

These morphological observations of the uniform character of the ganglion cell changes, produced by the action of poisons of such different natures, prompted the inference that the action of poisons of the extrinsic and bacterial group with certain restriction to be mentioned later, **all produced the same result in the nervous system as elsewhere in the body; namely, parenchymatous degeneration;** of an acute type corresponding with the acute or intense action of a poison, and of the chronic type of parenchymatous degeneration when associated with the gradual, intermittent, or persistent exhibition of a poison of a milder degree of intensity.

It seemed therefore while different phases of degeneration of the nerve cells attended the action of several members of the different groups of poisons in the above mentioned observations, that these cells changes were not evidences of individual or distinct pathological process but manifestations of the same thing, — a single, great, broad fundamental pathological process — acute parenchymatous degeneration of the nervous system.

It appeared then from these observations that two great groups of poisons, the bacterial and extrinsic classes, in the initial stages of their action on the nervous system were manifested by the same fundamental pathological process of acute degeneration, which was in harmony with the fact that this same pathological process is elicited by the action of these same poisons in other organs in the body as well as the nervous system.

This led not only to acceptance of the inference that acute parenchymatous degeneration is the expression of the action of poisons in the nervous system as well as in the body universally but also that the converse of this proposition — with certain qualifications, — is also true.

These qualifications are that other factors in the production of disease than toxic agents must be taken into consideration and excepted in stating the converse of the proposition that poisons generically induce acute (or chronic) parenchymatous degeneration of the nervous system.

There are besides toxic agents certain traumatic and mechanical factors in the production of acute or chronic parenchymatous degeneration of the nervous system. If there be certain mechanical disturbances in the nutrient supply of the ganglion cell or certain mechanical interferences in its metabolism, parenchymatous degeneration results just as well as in the action of toxic substances. For instance, if the blood supply be cut off from a mass of ganglion cells they undergo changes identical with those in the process of acute parenchymatous degeneration.

Hence, excluding certain traumatic or purely mechanical or nutritive factors in the induction of disease, I am led to accept the belief that acute (or chronic) parenchymatous degeneration of the nervous system as elsewhere in diseases of the body at large, postulates the action of a poison and also the belief in the value of a posteriori reasoning from the effect of acute or chronic parenchymatous degeneration of the nervous system to the cause residing in a poison or poisons of one form or another.

Given, therefore, acute (or chronic) parenchymatous degeneration of the nervous system, as shown in Plates I and II, the action of a poison is indicated.

But since all poisons seem to act alike on the cell, the poison can not he identified, and we are justified in saying that this morphological evidence of degeneration alone points to the action of a poison only in the generic sense.

Thus in any acute neural disease, or in the involvement of the nervous system in an acute general illness, even of unknown causation or in the chronic affection of the nervous system left behind months or years after these two conditions, when acute parenchymatous degeneration or its results are found, the imprint of this great extensive pathological process on the ganglion cell, indicates the action of toxic forces as plainly, as the marks on the rocks show the glacial action.

Parenchymatous degeneration of the nervous system, then, especially the acute variety, although the distinction between the acute and chronic forms in relation to toxic agents corresponds only to differences in the manner and duration of exhibition of the poisons, may be considered as a reliable clue to the action of a poison. This clue is also of value, even if the results of this cellular degeneration of the nervous system are observed months or years after the acute primary poisoning of the nervous system when the dependence of a chronic mental disease on this antecedent condition has been overlooked.

While little or nothing may be known about the nature or source of subtle and seemingly intangible pathogenic poisons, beyond suspicions of their existence from the clinical history, nevertheless existence in the body of these poisons may be postulated and their causal relation to the neural clinical manifestations may be determined by the morphological changes of parenchymatous degeneration recorded in the nerve cell by their toxic action.

Furthermore, in other mental or nervous diseases, wherein the source or nature of a poison is so artfully concealed from clinical or other scrutiny that we have not as yet arrived at even definite suspicions of a toxic agency, we shall, nevertheless, be enabled through this morphological line of evidence, to demonstrate the presence of a poison or poisons as the causal factor of the disease, and in a great measure explain the reason of the clinical manifestations.

These neurocytological investigations were then extended from the field of extrinsic and bacterial poisons to Uraemia, Sun-stroke and experimental Thyropravia. This latter disease manifests such a close clinical resemblance to a severe and fatal form of tetany, that an understanding of the former is most valuable in interpreting, in a general way, the modus operandi of the poison in the latter disease.

From the above outlined studies leading to the interpretation of acute parenchymatous degeneration of the nervous system as an index to the action of poisons, upon discovering this acute parenchymatous degeneration in one or another of its phases in the nervous system in these 3 diseases, I knew that such nerve cell changes (like those in Plate I) were the handiwork of some unknown poison or poisons.

Having established in this way that the existence of poisons was responsible for these 3 diseases, the next step was to ascertain to what great group these unknown poisons pertained.

As indicated previously in the studies of extrinsic and bacterial poison, the changes in the ganglion cells are not particularized or distinct for the different poisons or groups of poisons, but are fundamentally the same in expressing mere phases of a single great pathological process.

Thus the identification of the class of the unknown poisons in these 3 diseases could not be determined from the histological changes in the nerve cells alone.

But by the process of exclusion one after another of the several great groups of poisons as enumerated in the beginning of this section could be eliminated until the unknown poisons indicated by the neural parenchymatous degeneration become narrowed down to a particular class — auto-poisons.

This process of elimination can be pursued with considerable certainty in grouping the unknown poison indicated by the structural traces of its action on the ganglion cells.

Partly by the character of the onset of the symptoms, partly by the course, duration and termination of the clinical history, and partly by the disclosures of the autopsy examination together with the microscopical examination of the organs in general, poisons of one or another particular class may be excluded with considerable certainty.

Extrinsic poisons are generally easily excluded by the character of the clinical history. Bacterial poisons are excluded in a general way by the absence of the bacteria themselves, and the structural reactions of the body against them.

Protozoal poisons and poisons due to pathogenic fungi, in the present incomplete state of our knowledge concerning them, are much more difficult to exclude.

Thus, in these 3 diseases, Thyropravia, Sun-stroke and Uraemia, the unknown poisons indicated by the acute parenchymatous degeneration of the nervous system could by this process of elimination be reduced to the auto-toxic class.

And, I do not hesitate to believe, reasoning in this way, that I have established a method of taking evidence from a purely morphological standpoint, which, when conjoined with the process of elimination of other groups of poisons, is very trustworthy, in investigating **The Autotoxic Basis of Mental and Nervous Diseases in general.** Furthermore, reasoning by analogy from these 3 types of auto-intoxications of the nervous system more or less well-proven from the purely morphological standpoint in conjunction with the process of elimination of other groups of poisons, **I am inclined to extend the auto-toxic basis of nervous and mental diseases quite widely indeed, especially to some of the forms of melancholia, epilepsy, mania and other varieties of mental and nervous diseases. Finally I would remark that the discovery of acute parenchymatous degeneration in the nervous system in these 3 types of auto-intoxications, namely, Thyropravia, Sun-stroke and Uraemia, adds still another great group of poisons to the list of extrinsic and bacterial toxic agents which all manifest their action on the nervous system, as elsewhere in the body, by this same pathological process.**

Therefore this finding of acute degeneration of the nerve cells due to the action of the acute Auto-Intoxicants, permits me to believe still more freely that not only Extrinsic Bacterial and Auto-Toxic Poisons induce parenchymatous degeneration of the nervous system, but that the action of poisons in general is attended with this result, and that, broadly speaking, with the exceptions noted before, the converse of this proposition is also true.

Perhaps the best understood of the Auto-Intoxications is the group due to the retention of substances which ought, in the normal condition, to be excreted.

In this group of Auto-Intoxications the study of the toxicity of the urine is exceedingly interesting and apparently reliable as an index or measure of the auto-toxic substances retained within the body.

It has been estimated by Bouchard that the normal individual secretes waste products in 52 hours in the urine alone which, if retained in the body, would be a sufficient amount to prove fatal. This author, studying the toxic effects on animals of urine from the normal individual, has established a uro-toxic coefficient.

The urotoxic coefficient means that a given quantity of urine from the normal individual injected in a test animal (rabbit) of a given weight produces a fairly uniformly definite result. The animal dies within a certain time with characteristic symptoms indicating involvement of the nervous system.

If a smaller amount of urine produces this result in a test animal the urine is said to be hypertoxic, and, on the other hand, if a larger amount of urine is necessary to produce the same result, it is hypotoxic.

The hypotoxic condition of the urine may be taken to indicate a retention of the physiological products of metabolism, and during the onset of the symptoms accompanying an Auto-Intoxication of this class it appears to be demonstrable in animals that the toxic substances which are normally secreted by the urine are deficient in amount. If, on the other hand, during the cessation or after the acute attack of the auto-intoxication the urine when injected in animals shows a return of the excess of toxic substances retained during the attack, it is said to be hypertoxic to the test animal. This means that there is an excess over the normal toxicity of the urine. Finally, while a hypertoxic condition of the urine may be taken to indicate the return of retained physiological waste products in the urine, it may also indicate the presence of newly or abnormally formed poisons within the body which have been absorbed into the circulation and have been excreted in the renal circulation.

Thus while hypo-toxicity of the urine before an attack of auto-intoxication, may be taken to indicate retention of normal physiological waste products within the body, hypertoxicity of the urine during or after an auto-toxic attack may indicate the presence of auto-toxic poisons of at least 2 sources:

1. The hypertoxic condition of the urine, as an antithesis of the hypotoxic condition, may indicate the return of withheld physiological waste products.

2. The hypertoxic state of the urine has no relation to an antecedent hypotoxic state, but indicates the presence of poisons of another class than the "retention group," viz.: poisons which have been newly formed within the body, or poisons whose development habitually attends chemical process in the body, but which have not been properly transformed into innocuous compounds by certain organs for that purpose and have gained access to the general circulation.

For example: in the intermediary metabolism of the tissues in general some foreign toxic substance may arise and appearing in the urine, excreted from the circulation, gives a condition of hyper-uro-toxicity: or if in the development of toxic substances which habitually and normally attends gastro-intestinal digestion, these toxic agents are not nullified or transformed into useful body nutrient substances by reason of any derangement in the process of absorption, such toxic agents may in the same way appear in the urine and confer a hypertoxic quality.

Classification of the Auto-Intoxications

Albu, of Berlin in 1894, suggests the following general classification of auto-intoxications:

1. Auto-intoxications from the suppression or disturbance of the functions of an organ.

These are due to diseases of the glands with or without anatomical changes, although **the most frequent anatomical lesions in the glands accompanying these Auto-Intoxications are atrophic changes.**

The auto-intoxications of the thyroid gland belong in this list, such as myxoedema, and cachexia strumipriva.

Diabetes, acute yellow atrophy of the liver, and Addison's disease, due most undoubtedly to lesions respectively of the pancreas, the liver and the suprarenal capsules, are also included here. **This list should also include the diseases which are due to the suppression of the function of those organs, such as the liver, which destroy such absorbed noxious material from the gastro-intestinal tract or other poisonous metabolic products as are constantly formed within the body.**

2. Auto-Intoxications which occur from anomalies in general metabolism without any definite localization, — In this class of auto-intoxications the diseases which depend upon the absorption in the circulation of the intermediary products of metabolism or the products of retrogressive metamorphosis belong, for instance, gout and oxaluria.

3. Auto-intoxications which are caused by the retention of the physiological products of metabolism in the different organs. — In this category belong the severe form of poisoning due to extensive destruction of the skin by burning, carbonic acid poisoning by inhibited or deficient respiration, uraemia and eclampsia gravidarum.

4. Autointoxications due to the over-production of physiological and pathological products of the organism, such as hydrothionaemie, ammoniaemia, acetonuria, diaceturia, cystinuria, etc., also diabetic coma, coma carcinomatosum, etc., and Basedow's disease.

Midway between groups 3 and 4, and partaking in a measure of each, are placed the great majority of auto-intoxications arising from the gastro-intestinal tract, associated with acute or chronic digestive disturbances, with or without pathological changes in the gastro-intestinal tract.

Depending upon the regional distribution, or localization of the source of the autointoxication:

1. Autointoxications from the skin. — For example, the toxic symptoms due to extensive burning of the skin.

2. Autointoxications from the lungs; carbonic acid poisoning from deficient lung capacity or respiration.

3. Autointoxications from the kidneys; uraemia and eclampsia.

4. Autointoxications from the suprarenal capsules; Addison's disease.

5. Autointoxications from the gastrointestinal tract. — The auto-intoxications from this source comprise a very large group, and their relations to the production of nervous and, probably, mental symptoms is intimate and pronounced; for instance, Tetany, some forms of Epilepsy, periodic Paralysis, Eclampsia Infantum, Thomsen's disease, and according to some French observers, Melancholia and a class of Psychoses which has been termed by them " Visceral Psychoses."

6. Auto-Intoxications in the liver; acute yellow atrophy, icterus gravis, cholaemia.

7. Auto-intoxications from the pancreas; diabetes mellitus.

8. Auto-intoxications from the thyroid gland; myxoedema, cachexia strumipriva, and probably Basedow's disease.

A classification on the basis of physiological chemistry is indicated by Kraus and Honigman as follows:

a. Autointoxication of Intermediary Metabolism
b. Acid Auto-Intoxications
c. Human diseases, in which Acid Auto-Intoxications are due to the accumulation of Benzyl Oxy-Butyric Acid, and its compounds
d. The Uric Acid diathesis
e. Alkaptonuria
f. The Auto-Intoxications from the Internal Secretions
g. Cachexia thyroidinea
h. Uraemia

These various types of Auto-Intoxications must be Very Important Factors in the Production of Nervous and Mental Diseases, for the nervous system is more sensitive, apparently, to this group of poisons than any other tissue or organ in the body.

The prevailing symptoms of most of the Auto-Intoxications are most decidedly Due to Poisoning of the Nervous System; for instance in:

Myxoedema, Thyropravia, Basedow's Disease, Insolation, Tetany, some examples of Epilepsy, etc...

In many cases of uraemia, the predominant symptoms are manifestations of poisoning of the nervous system.

In others of the more obscure Auto-Intoxications the nervous symptoms are the only apparent manifestations of the Auto-Intoxication.

In fact, the only clue to indicate the presence of some of the more obscure auto-intoxications, is exclusive symptoms of the nervous system; for instance, **the only obtrusive indications of some of the Intestinal Auto-Intoxications are:**

1. **Migraine**
2. **Dizziness**
3. **Syncope**
4. **Delirium**
5. **Coma**
6. **Somnolence**
7. **Sopor**
8. **Tonic and Clonic spasms**
9. **Epileptic and Epileptoid attacks**
10. **Many cases of Epilepsy**
11. **Melancholia**
12. **Mania**
13. **Periodical Forms of Insanity**
14. **Other Varieties of Mental Disease**

The Morphological Effects of these Poisons on the Ganglion Cell

The reason for this susceptibility of the nervous system to auto-toxic poisons is patent. The high organization of the ganglion cell, the most complex cell in the human body, — a cell in which the internal structure is most intricate and delicate, — must naturally, other things being equal, undergo changes from contact with a poison and express parallel physiological disturbances more readily than the more lowly organized cells which compose the ordinary viscera, or the static cells of the general tissues of the body.

There are a few examples of Auto-Intoxication in which there is an unequivocal demonstration of the involvement of the nervous system by an Auto-Poison.

In experimental Thyropravia in dogs **the universal acute degeneration of the destructive type which involves the whole cortex of the brain, corresponds very well with the fatal manifestations of irritation and destruction of portions of the Nervous System.**

These changes in the ganglion cell can have no other explanation than in the action of an auto-poison circulating within the body which comes in contact with the ganglion cell.

In certain cases of uraemia I have been able to demonstrate acute degeneration of the cortical cells, but of a much less extensive and severe type than in thyropravia.

In insolation, I have also found an acute degeneration of the nervous system of variable degrees of severity, which must be due to an auto-toxic poison.

While the nature of the poison in this case is entirely obscure, there is absolutely no doubt about the way it acts upon the nervous system. (Plate I.)

The poison produces an acute degeneration of the cortical cells which, in some instances, goes on to destruction of the cell.

I cherish the expectation that in Myxoedema (Thyropravia), in the late neural manifestations of Addison's disease, and Diabetes, in Tetany, Basedow's disease, the Epilepsies, in many of the Melancholias, Manias, periodical Insanities, and very many other forms of mental and nervous diseases that similar phases or results of neural parenchymatous degeneration will be found to furnish a definite basis to explain the parallel clinical manifestation.

The gastrointestinal tract, including the liver, would seem to be a most important source of Neural Autointoxications.

Here poisons are habitually and normally formed, and the only safeguard of the body against them (unless destroyed by the bacteria of the gut) is their transformation into innocuous compounds or useful body nutrients in the process of intestinal absorption or in the hepatic circulation. How readily, then, may these constantly present latent poisons of the gut be transformed into potential poisons through some hidden intangible error in the process of absorption or by some more palpable actual lesion of the organs concerned in this process.

It is from this source that we can best understand the insidious leaking into the circulation of poisons which are probably not generally acutely and intensely virulent but are more often of the slow, chronic, persistent, and exacerbating type so dangerous to the integrity of the cortical neurons of the brain by their prolonged or repeated action.

But it is the exception to find symptoms indicating the development of such poisons.

Only the effects of the poison are witnessed at a distant point of the body as a rule: in a slow, gradual, persistent or intermittent poisoning of the nervous system, especially in the brain cortex, attended with the parallel mental or nervous symptoms.

It is not remarkable with such an intangible relation of cause and effect, that many forms of mental disease have seemed such utter mysteries and barriers to morphological chemical investigation.

At present, the application of the methods and **knowledge of modern cytology to the nervous system furnishes the means of demonstrating these effects — we may see the handiwork of a poison in the brain even if its nature be unknown.**

This alone is a great step forward in the progress of the pathogenesis of mental diseases.

One of the strongest arguments in favour of the causation of many of the sub-acute, periodical, or chronic psychoses by the Gastro-Intestinal Auto-poisons is the persistent or confirmedly intermittent character which may be justly imputed to these poisons from the very nature of their development.

A poison of this nature is admirably suited to explain the etiology of some of the most obscure forms of mental disease, such as certain of the varieties of Melancholia, Mania, the periodical or alternating forms of these affections, Neurasthenia, the graver hysterical and cataleptic conditions, etc., associated with these psychoses.

The acute, sub-acute or chronic character of some, if not many, of the melancholias, manias, and allied psychoses, **corresponds to variations in the intensity and duration of exhibition of the auto-poisons.**

These fluctuations in intensity and duration of the action of the poison on the cortical nerve cells from the peculiarly variable factors governing their development can be perhaps more graphically realized in the gastro-intestinal than in any other class of auto-poisons.

Intensity and duration of exhibition of poisons in general as well as the Auto-Poisons are the great factors which control the character and termination of the Toxic Mental and Nervous Diseases. Upon these two factors, especially the latter, depends the issue of recovery or improvement or a chronic incurable disease dependent upon permanent damage to the nervous system.

While intensity and duration of exhibition are variable functions of the poison itself, both of these factors, especially the latter, are greatly modified by the body forces which combat poisons.

For instance, **a given (auto) poison will operate longer in an individual with impaired Emunctories than in the normal subject,** or act more intensely in a man whose nerve cells have been previously damaged by alcoholism or other poisons.

Studies of general **toxic changes in the nerve cells**, and also in 3 examples of **Neural Auto-Intoxications** (Insolation, Thyropravia and Uraemia) with especial reference to the modifications of the toxic cell changes induced by mutations in the intensity and duration of the action of the poison confirm the following statements.

The severity of Toxic Degeneration of the nerve cell, is in direct ratio to the duration of the action of the auto-poison.

While the poison may be intense and virulent, if it acts for a brief period only on the nerve cell, the resultant degenerative changes may be recovered from upon the cessation of the poison.

There may be profound internal changes in the cytological elements, (Plate I, Fig. 1) but, nevertheless, the cell may be built up again and recover both structure and function.

But if the action of the poison continues beyond a certain period the degenerative changes eventuate in destruction of the cell (Section V, Plate I, Fig. 2).

There is in this case either death of the individual or, if he recovers, the nerve cells (in whatever portion of the nervous system acted upon) are damaged permanently, and their loss is absolutely irreparable.

These 3 great groupings of auto-poisons according to the variable factors of intensity and duration of action correspond to certain phases of degeneration of the nerve cells.

This in turn determines the prognosis, course and termination of not a few examples of acute, subacute and chronic types of mental and nervous diseases.

The whole course, duration, termination and prognosis of toxic mental and nervous diseases, whether due to auto-or other poisons, depends upon the course or termination of parenchymatous degeneration controlled by the duration and intensity factors of the poisons.

I would therefore suggest the terms Cytolysis, Cytoclasis and Cytothesis to particularize certain stages and results of parenchymatous degeneration of the nervous system which govern the prognosis and general character of the toxic neural diseases.

The term Cytolysis (from a hollow, a vessel, hence a cell, and the act of loosing or resolving — hence cell resolution) signifies the successive series of cell degeneration up to, but not beyond, the point of destruction of the cell.

Cytolysis comprises the phases of degeneration in parenchyma cells which may be recovered from; it signifies resolution, but not destruction of the cell, and may be succeeded either by restoration or destruction of the cell. (Plate I)

The term Cytoclasis (a cell, and the act of breaking to pieces — hence cell destruction) comprises the progressive phases of parenchymatous degeneration which involve destruction of the cell. (Pl. I, Fig. 2)

Cytoclasis signifies the process of necrosis of the cell.

In the neurons cytoclasis is permanent and absolutely irreparable. It is a process that succeeds cytolysis.

The term Cytothesis (the act of binding or tying together — hence cell restoration or reconstruction) comprises the steps of restitution of the cells, after the initial and non-destructive stages of parenchymatous degeneration.

The cytothetic process is the reverse of the cytolytic.

In the chronic phase of parenchymatous degeneration of the nervous system, as in other parenchyma cells throughout the body, the stages of degeneration occupy a longer time in their development.

The process goes on slowly, gradually, and continuously with exacerbations in **the action of a poison insidious in its mildness but fatally dangerous to the integrity of the nerve cells acted upon.**

What is called peripheral neuritis is a most beautiful example of subacute toxic parenchymatous degeneration of some of the neurons of the spinal cord.

There are, then, 3 great periods in the time factor of the exhibition of poisons to the nervous system, the:

1. **Acute**
2. **Subacute**
3. **Chronic periods**

To sum up the matter briefly and in a general way, **the acute, subacute or chronic development of the toxic neural diseases is very largely the expression of corresponding conditions of acute, subacute or chronic phases of neural parenchymatous degeneration caused and controlled by mutations of the time factor in the exhibition of poisons.**

Hence the acute, subacute and chronic conditions of the toxic parenchymatous degeneration, and the acute, subacute and chronic development of the associated neural diseases merge imperceptibly into each other.

For example, cytolysis of the cortical neurons underlying the symptoms of the acute delirium in sun-stroke, typhoid fever or in the acute infectious diseases is generally succeeded by complete cytothesis of these neurons upon the cessation of the poison. Recovery of the neurons is also possible in the subacute poisonings of the nervous system. But it is more tardy, irregular and more liable to be incomplete than in the acute toxic condition, for the border line between cytolysis and cytoclasis is more liable to be crossed.

In a subacute poisoning of the nervous system there may be nearly complete recovery, but we can never predict to what extent cytoclasis may have been induced by the more protracted exhibition of the poison.

Poisons will act on the nervous system when we find but little or no trace of their action elsewhere in the body.

The clinical phenomena of one Nervous Disease, namely, Tetany, which often seems definitely due to alimentary auto-poisons, are in accord with the general action of poisons on the nervous system.

The establishment of the Gastro-Intestinal Auto-Toxic origin of many examples of a single individual disease of the nervous system, as in Tetany, furnishes most valuable aid in ascertaining the connection of these poisons with other forms of neural disease.

I —The Acute Gastro-Intestinal Auto-Poisons

If Epilepsy be due to the action of Gastro-Intestinal Autopoison — which, I am inclined to believe, is the case in many but not in all instances of the disease — it is a most beautiful example of the persistent intermittent action of an evanescent poison upon the cortical neurons. Whether the action of the poison or poisons of Epilepsy be associated with chemical or structural changes in the motor cortical neurons, the poison is so evanescent that restoration of the neurons is prompt and perfect. **Thus in idiopathic Epilepsy, the attacks due to the action of an evanescent poison circulating in the blood may be prolonged for months and even years, without apparently producing cytoclasis of the motor cortical neurons. This disease is a fine example of the definite relationship of cytothesis of the nerve cell to the duration of the poison. Epilepsy heads the list of Toxic Diseases in the brevity of the exhibition of the poisons. The action of the poison or poisons of Epilepsy on the nervous system illustrates the first member of the great progressive serial scale of the time factor of poisons in toxic diseases.**

This varies between an evanescent poison at the beginning of the series and an indefinitely prolonged or constant toxic exhibition at the final end of the scale. Hence, the disease is one of the finest examples of rapid and perfect cytothesis of the cortical neurons, and this apparently continues after each attack for a long time — for months and even years. **These opinions of the Toxic origin of Epilepsy** are not mere conjectures, nor are they prompted from a tendency to make the disease fit in with too generalized an application of the toxic basis of neural disease, but **are formed from the results of a diligent search of some years for the structural changes in the brain in 10 or 12 cases of the idiopathic form of the disease. I can find no explanation of the results of the microscopical examination of the brain in these cases, except by ascribing these results to the transient action of an intermittent poison, which gains access somewhere to the general circulation. The subject of the toxic basis of neural diseases is so vast** that throughout the sections of the second part of this discourse, the action of toxic substances for the sake of simplicity, is limited as far as possible to the parenchyma or neurons of the nervous system.

The Action of Toxic Substances on the other component element of the Nervous System — the Stroma or Neuroglia — is manifested in an entirely different manner than in the Parenchyma, and will be discussed later in Part IV.

Having found an increase or overgrowth of neuroglia in the sub-cortical zones in the motor regions in the examination of several of these idiopathic cases, I am unable to interpret this except by the action of a poison for this reason.

It appears that the stroma as well as the parenchyma of the brain may indicate the action of a poison although in a different way.

This increase of neuroglia in the sub-cortical zones in Epilepsy, I do not regard as a primary cause of the symptoms, but as a secondary effect of a poison.

I have reasons, therefore, from the morphological line of investigation, which, when joined with the peculiar clinical behaviour of the disease, make the acceptance of its toxic basis almost compulsory.

There seems to be no other way of explaining the symptoms of the disease or the associated changes in the brain.

Furthermore, the poison must be of the auto-toxic category.

For the development of these poisons is perfectly compatible with the evanescent character of the epileptic poison, while none of the members of the other great groups of poisons is endowed with such a peculiar transitory characteristic.

Finally, I am unable to reject the suspicion that **the particular class of auto-poisons perhaps best adapted to confer the evanescent property of the epileptic poison is the gastrointestinal group.**

This seems so because of the facility with which latent poisons in this region may momentarily become potential, and on account of **the close analogy which Epilepsy bears to Tetany, a disease frequently caused by Gastro-Intestinal Auto-Intoxication.** It will be recalled that not infrequently **Antiseptic Therapeusis of the Alimentary Tract modifies the occurrence of the Epileptic Attacks to a considerable extent.** Yet, **other varieties of Auto-Poisons may be responsible for Epilepsy just as well as the Gastro-Intestinal class.**

The Auto-Poisons of intermediary metabolism, of which we are almost entirely ignorant, **may contain a member of this evanescent character.**

Or a poison from some other equally unknown source in the body may accumulate beyond the nullifying capacity of some **one of the poison destroying organs (like the liver); then the Poison suddenly gains access to the Blood; and the Epileptic Fit may Occur. I have, therefore, classified the disease among the Gastro-Intestinal Auto-Intoxications. This has been done merely because we do understand something about the development of this class of auto-poisons, and on account of the resemblance of Epilepsy to tetany, the one clearly understood type of Gastro-Intestinal Auto-Intoxication.**

b. — **If the Gastro-Intestinal Poison be again of considerable intensity but of somewhat longer duration than in Epilepsy, quite similar manifestations occur in the Toxic Action upon the Motor Cortex.**

The duration of such a poison is transient rather than evanescent, and elicits the symptoms of the typical cases of Tetany. Here, again, like the case of Epilepsy, whatever measure of slight cytolysis of the motor neurons of the cortex is induced by the poison, is promptly effaced by cytothesis after the cessation of the poison. The poison producing Tetany, however, is not so uniform in the element of the time factor as that of Epilepsy. The poison of Tetany seems subject to much variation in this respect, for the attacks show many different grades of severity and duration. In the severer and more protracted attacks and especially in the fatal forms of the disease, cytolysis should be quite pronounced if the brain were examined shortly after the attack.

In the fatal form there is undoubtedly cytoclasis of the motor cells of the motor cortex and probably severe degeneration of cells in other cortical regions.

In these fatal cases, while the poison at first has a selective action on the motor cortex as in the mild cases, as the toxic agent grows more intense and protracted in its action, probably the whole cortex is involved.

c. — If the Gastro-Intestinal Poison be again of transient duration but of a very mild intensity, its action on the nervous system might be taken to explain certain attacks of: Migraine, Sopor, Vertigo, Eclampsia of children, Mental Inertia, Depression, Hebetude, &c., or other minor functional affections of the brain which are so often overtly associated with gastro-intestinal disturbances.

The connection between these minor so-called functional derangements of the nervous system occurring in the form of attacks is frequently so overtly associated with tangible derangements of the alimentary tract that it has always been more or less well recognized popularly.

Celsus, was well aware of the relation of cause and effect in some of these instances in saying:

"Almost Every Convulsion is Caused by the Abdomen."

The explanation of this relationship between even these minor or transient nervous manifestations and the less unobtrusive gastro-intestinal disorders must be in the leaking into, or uncombated Entrance Into, the Circulation of some latent Toxic Substance from the Alimentary Tract which Poisons the Nervous System.

It seems only a question of degree in the severity or duration of the alimentary poison, and the resultant neural degeneration which establishes the indefinite line of distinction between these minor transitory so-called functional manifestations of the nervous system, and some cases which show the graver symptoms of actual psychoses.

Independent of actual lesions of the gastro-intestinal tract in children, the mere education of the alimentary system to fulfil its functions, is attended with experiments and errors.

This is not infrequently accomplished in the developing infant without emphatic manifestations of transient poisoning of the nervous system evidenced most frequently by spasms or convulsions. It is hardly to be expected in such instances that cytolysis occurs to any obvious or measurable extent. Or if the action of a poison of such a nature should produce initial degrees of cytolysis, this is promptly effaced by cytothesis upon the cessation of the poison.

It is very likely that the action of such poisons on the ganglion cells of the cortex results in a chemical change without parallel structural alterations.

I believe that the symptoms of many of these minor so-called functional derangements of the brain or other portions of the nervous system, are the expressions of the action of auto-poisons, particularly those of the gastrointestinal tract.

This can be the more readily realized perhaps when it is recalled that the blunting and soporific effects of such drugs as the bromides on the nervous system are apparently induced by cytolysis of the ganglion cells.

When this drug is given in large and continuous doses to rabbits it produces decided cytolysis of the whole central nervous system, as shown by Pandi.

The induction of sleep more particularly after fatigue is apparently a phenomenon of Auto-Intoxication for Mosso and Arbelous have demonstrated the toxicity of the blood in fatigued animals.

At this point it is necessary to allude very briefly to the matter of the selective action of poisons upon different regions of the nervous system.

In a general way the selective action of different departments or regions of the nervous system by poisons determines the distinction between purely nervous diseases and mental diseases.

In the two preceding examples of Epilepsy and Tetany we had under consideration poisons which exhibited a selective action upon the motor neurons, especially those of the brain.

Hence the action of these poisons elicits in the typical cases a particularized, characteristic and definite group of symptoms due to the excitation of the motor zones of the brain.

In the succeeding varieties of the exhibition of gastrointestinal auto-poisons this selective or localized action of the poison on the nervous system is reduced to a minimum.

There is a general action of the poison to a greater or less extent on the whole cortex. If there be any selective action on the cortex in the beginning of the action of these poisons, such selective action very soon merges into a more or less general involvement of the whole cortex.

d. — **In the case of a gastro-intestinal poison of considerable intensity, of brief duration but of general action on the brain cortex, the conditions are present for the development of mental symptoms of the acute type. The generalized action of such a poison on the cortex according to various phases of intensity and rapidity of development might produce acute delirium, or a form of acute mania or melancholia of rapid development. These sets of mental manifestations are expressions of the toxic cytolyses of the cortical neurons.**

Why cytolysis of the brain cells should manifest activity of the cortex in one case and cortical inertia in another case is difficult to fully explain.

In the exhibition of the acute poisons of generalized action on the cortex we observe excitation of the cortical neurons in many instances.

But in other examples the symptoms are indicative of an abrogation of the functions of these neurons.

Leaving, for a moment, these acute gastro-intestinal auto-poisons which act generally on the cortex, let us consider the action of better known poisons of similar properties in the acute bacterial diseases.

In the poisoning of the brain in the acute infectious diseases, we find expressions of excitation of the cortical neurons in some cases and a depression of their functions in other cases.

The excitation of the neurons corresponds to the delirium preponderating in some of these cases, and the depression or annulment of the functions of these neurons corresponds to stupor, confusion and coma in other cases.

The delirium in these Bacterial Toxaemias of the brain implies a hyperkinesis of the cortical neurons, and the stupor, confusion and degrees of coma, a hypokinesis of these same neurons.

These terms of hyper- and hypokinesis of the neurons are merely words of convenience to signify excitation and depression of the functions of the neurons.

The bacterial poisons express their toxic action on the brain in acute delirium or in analogues and degrees of coma.

This is due to an embodiment of acute parenchymatous degeneration of the brain cortex with its attendant phases of:

- **Cytolysis**
- **Cytoclasis**
- **Cytothesis**

I believe this to be the case, in the first place, by finding acute parenchymatous degeneration in the cortex in a case of typhoid fever.

Secondly, **I find that this degeneration of the cortical neurons in typhoid fever is not essentially different from the changes in the cortical nerve cells associated with the acute delirium of sun-stroke, the delirium or coma of acute alcoholism or the coma of uraemia.**

So the explanation of these mental symptoms of poisoning of the brain in excitation or depression of its functions whether the poison be alcohol, the toxines of typhoid fever, or the poison of sun-stroke, resolves itself again in this matter of cytolysis, cytoclasis, and cytothesis of the cortical neurons.

But how does this same process of cytolysis produce such different results as hyperkinesis, hypokinesis and akinesis of the neurons (loss of action or function of the neurons).

This is a very complicated question, but I believe that the answer, in part, at least, may be stated as follows: The different expressions of the disturbance of functions of the neurons such as hyperkinesis, hypokinesis and akinesis are caused by differences in the mode of development of cytolysis.

Apparently, rapidity of development in some instances is a factor of considerable importance in governing the character of the development of cytolysis of the neurons.

It seems that when the stages of cytolysis occur progressively and serially within a comparatively brief time in a given nerve cell, there is an acute excitation of that cell. But if a part or all of these serial steps of cytolysis occur collectively in a given nerve cell there should be corresponding expressions of hypokinesis or akinesis of that cell.

I believe this to be the case, first, from studies of the anterior horn cells of the spinal cord in a case of brief poisoning with well marked clinical manifestations of hyperkinesis of these cells.

These cells showed beginning or only moderately advanced and progressive stages of cytolysis in the resolution of the chromophilic placques.

Secondly, studies of the anterior horn cells in peripheral neuritis with clinical symptoms of hypo- and akinesis of these cells not following previous hyperkinesis showed final stages of cytolysis.

The cells were quite thoroughly bereft of their chromophilic granules. (Plate I, Fig. 2) Hence, observing in this latter case that the ultimate stages of cytolysis correspond to akinesis of the neurons, I am led to believe as follows: If these ultimate stages of cytolysis in a neuron are reached by a collective occurrence of the phases of the process, akinesis would be expressed in that neuron.

If these same ultimate stages are attained by a serial progression of cytolysis, akinesis of the neuron would be preceded by hyperkinesis.

It might appear then, speaking broadly, that toxic delirium is associated with the serial progression of cytolysis.

And, on the other hand, it would seem that **stupor, coma and other expressions of hypo- and akinesis of the cortical neurons when developing as an individual group in acute or subacute poisonings of the brain are associated with a more or less collective or simultaneous occurrence of the stages of cytolysis.**

This reference to the different expressions of functions of the neuron apparently associated with different modes of cytolytic development has been made for this reason. In returning to the subject of acute and subacute mania and melancholia we can see that, such clinical antitheses are not necessarily associated with radically different groups or especial kinds of poisons or essentially different pathological processes.

Let us now return to the subject of the relation of these two forms of mental disease in connection with the acute gastro-intestinal class of poisons.

Let us now consider if acute mania might be explained in a measure by being associated with an acute gastrointestinal poison of the properties noted under the class d.

In the action of such a poison we might understand how the stage of excitement or hyperkinesis would be parallel to progressive cytolysis which operates to a greater or less quantitative extent on the cortical neurons.

After the cessation of the poison and the cytolytic process has reached its qualitative and quantitative limits in the involvement of the cortical neurons, there should be a period of hypo- or akinesis governed by the extent of these limits.

This period should last a variable time pending the operation of cytothesis. Speaking generally, if cytolysis has approached its final stages, the stage of excitement is succeeded by a period of hebetude, confusion, stupor and general psychic depression.

The degree of the symptoms of this secondary period of psychic depression is proportional to the stage at which cytolysis culminates and to the number of neurons involved. From theoretical considerations the rapidity of cytothesis should be directly proportional to the qualitative and quantitative extent of cytolysis. If cytolysis be not far advanced and involve comparatively few neurons, cytothesis is rapid; if the reverse conditions attend cytolysis, the cytothetic process is more tardy and the depression period pending its action is more prolonged.

If the action of the poison be more prolonged so that cytolysis passes over into cytoclasis, a certain amount of permanent damage of the brain results from the akinesis of the destroyed neurons.

If the poison then ceases, the cytolytic neurons which have been increased in number by this extra increment of duration of the poison may be repaired so that there is incomplete recovery.

If this be still more protracted, an increased number of neurons undergo destruction and so onward.

The prognosis, therefore, made possible by this factor of cytothesis is favorable in such cases.

Let us now consider **the operation of such a poison (class d) in the production of acute melancholia.**

Very much the same considerations are to be adduced as in the preceding example with regard to cytolysis, cytothesis and cytoclasis with this exception— the stages of cytolysis are probably produced more or less collectively instead of serially. There is no such marked secondary period indicating the culminative qualitative degree of cytolysis as in the preceding example.

The hypokinetic or akinetic condition of the neurons is not preceded by the hyperkinetic period — or, if this advance condition be present, it is of such slight degree as to be practically out of consideration.

The prognosis, as in acute mania, is again made favourable by the factor of cytothesis from the comparatively brief exhibition of the poison.

The manias and primary melancholias, whether of acute or subacute or chronic character, it seems to me, are ear marks of auto-poisons.

The body at large is not obtrusively diseased, as is the case with almost all other groups of poisons. **The general process of exclusion narrows these affections down to an Auto-Toxic Origin.**

They are not observed to be caused by bacterial diseases; and drugs or extrinsic poisons (acute mania from carbon disulphide poisoning in the artisans of rubber factories) which produce such conditions are easily detected.

Acute delirium is the rule in bacterial toxaemias of the nervous system.

We may now consider the production of acute delirium from this conjectural poison of class d. As indicated above, **acute delirium is more characteristic of bacterial poisons, and one or two extrinsic poisons, than of the auto-toxic group.**

Acute delirium of auto-toxic origin must be quite infrequent.

I know of one striking autotoxic origin, of acute delirium in insolation.

The delirium in some of these cases is very severe indeed, and sometimes is practically identical with delirium grave (this is probably largely occasioned by occurrence in patients with an alcoholic history **or in whom other factors mortgage the resisting and recuperative-powers of the body, such as renal and hepatic disease). If such a gastro-intestinal poison of class d be severe and intense enough to produce the hypothetical case of acute delirium, the relations of cytolysis, cytothesis and cytoclasis are, in a general way, quite similar to the instance of acute mania discussed previously.**

II —The Subacute Gastro-Intestinal Poisons

The relations of cytolysis, cytothesis and cytoclasis to the subacute forms are very similar to the acute forms of mania and melancholia.

Mutations and alternations of cytolytic development in the same set of neurons, but especially in successive masses of neurons involved by poisons, are worthy of much consideration in the explanation of the symptomatic expressions in the acute, and especially in the subacute, and chronic manias and melancholias.

If the duration of the poison be comparatively brief, the the prognosis is good. The case slowly recovers.

If the action of the poison be more protracted, improvement is more liable to be recorded than recovery.

If the action of the poison be still farther protracted and becomes persistent, these subacute cases of mania or melancholia pass over into the bourne of the chronic form whence they may never return or recover.

III — The Chronic Gastro-Intestinal Poisons

This group of poisons must be exceedingly important in the production of chronic, progressive mental disease, for it seems at present as if such poisons were intangible and beyond human intervention to deflect the brain from its hopeless path toward destruction.

The mental diseases produced by these poisons begin under the guise of the subacute form — Mania and Melancholia — which then becomes inveterate, progressive and chronic from this persistence of the poison.

If a permanent lesion interferes with the functions of the organs concerned in intestinal absorption, or if a habit inducing perverted chemical reactions in absorptions is once established, the conditions are favourable for development of chronic poisons of the gut.

The latent Poisons of the Alimentary Tube may then become potential and either persistent or confirmed and inveterate in their recurrent exhibition to the nervous system.

In the action of such a poison, the nerve cell is doomed, as it is ordained but once for the organism.

Little by little, sometimes perhaps, by almost infinitesimal increments of chronic cytolysis, the nerve cells pass on to cytoclasis.

Meanwhile new masses of nerve cells start in on the same course.

In no other affections of the human body does the term insidious in its technical qualification of disease apply so forcibly as in the chronic Auto-Toxic Forms of Insanity, viz.:

> ***"A disease progressing to a serious condition without (at first) exciting the notice or alarm of the patient or his friends."***

For such a poison, masking the danger of persistence with mildness, issues from the arcana of the somatic chemical forces, shackles the brain with Procrustean fetters and finally overthrows the nobility of the mind.

The operation of such poisons must eventually change the brain into a condition of terminal dementia.

It must not appear, however, that this more detailed consideration of the gastro-intestinal auto-poisons gives them an undue preponderance over other auto-poisons in the production of mental or nervous diseases.

These poisons have been used merely as a type to illustrate the action of acute, subacute and chronic autopoisons in general with reference to toxic cytolysis, cytothesis and cytoclasis in the nervous system.

It is simpler to use these poisons for such an illustration, **for we know something of the nature of their development.**

If only from partly theoretical grounds this is more than can be said of other groups of auto-poisons, for instance, those of intermediary metabolism.

Cytothesis (The Process of Cell Repair)

Having considered cytothesis somewhat at length, I am impelled to attempt to stimulate a more comprehensive application of therapeutic measures based on this process. I would urge the importance of this point with more words; but, as **Cytothesis is the Salvation of the Nervous System In All Forms of Poisoning, a plea to directly aid this process by Therapeutic Measures may be made brief. The primal aid to render the natural redemption of the integrity of the poisoned neuron in cytothesis, is to modify the intensity or duration of the poison.**

Hence, Therapeutic Measures, such, for instance, as have been adopted by W. C. Gibson in "Auto-Intoxication and Insanity", become very important indeed, and removed from empiricism.

This observer Treated a case of stuporous melancholia with the subcutaneous Saline Injections.

In this way, by controlling, if only temporarily, the duration and intensity of the poison, he aided cytothesis to such an extent that the symptoms improved considerably.

This and related Therapeutic measures should outweigh, it would seem, from theoretical considerations, the value of drugs, for they strike at the root of the evil.

The Value of Hydro-Therapeutic or other Anti-Toxic Measures in Insanity

A second important question in connection with therapeutics of the insane relates to the possible **cytolytic (relating to cytolysis, the dissolution or destruction of a cell) action of some of the drugs used in insanity.**

If any of these Drugs commonly used in the treatment of insanity Produce Effects by Cytolysis (Pathologic Dissolution or Disintegration of Cells), their administration demands much discrimination.

I can understand in a toxic disease that the substitution of an artificial poison in a drug for the toxine may be of benefit.

But to Add an Artificial Poison to a Toxic Substance Acting in the Nervous System Is A Sin. I have in mind the Bromides more particularly, and Their injudicious [unwise] empirical use in Epilepsy.

With these general considerations of **the action of gastro-intestinal auto-poisons on the nervous system**, we may now consider a definite example of this form of auto-intoxication in Tetany.

After experimental Thyropravia, Uraemia, Insolation, Myxoedema, and Addison's Disease, Tetany is a very clear example of an Auto-Intoxication, and one which operates in a most predominant way on the Motor Cortex.

From the fact that Tetany is so frequently associated with gastro-intestinal derangement, there can be but little doubt that the auto-toxic substances are absorbed from either the stomach or the intestinal tract.

The poison acts principally and selectively upon the motor segment of the central nervous system, especially its cortical portion.

Dilatation, ectasia and atony of the stomach, so often associated with tetany, give rise to conditions favourable for an auto-intoxication.

The food is retained in the stomach for an undue length of time, and gives origin to a number of secondary products which are not present in normal gastric digestion. The hyperacidity of the gastric juice under these conditions of the stomach entirely modifies the whole chemical process of gastric digestion.

The peptones are produced in excessive amounts.

They remain in the stomach subject to an unduly prolonged action of the hydrochloric acid, and it appears under these circumstances, that certain poisonous bodies may be formed, called pepto-toxins.

Bouveret and Devic isolated from the contents of the stomach in 3 cases of tetany, by Brieger's method, a substance which produced spasms.

Albu was able to demonstrate in the same patient that an alkaloidal body existed in the urine during the attacks, but was absolutely free from the urine in the periods between the attacks. The presence of these substances in the urine is a step nearer to the real demonstration of the circulation within the body of some absorbed poison of an auto-toxic nature in these cases of tetany; for to exist in the urine it would appear that the poison had been excreted from the blood.

The crucial experiment, however, is to test the toxic qualities of the blood of the subjects of tetany. If the blood serum be injected in animals and the symptoms of tetany can be reproduced in this way, we have a physio-logical demonstration of the toxic substance that will place tetany on the auto-toxic basis with certainty.,

It is a matter of clinical experience that many cases of tetany are accompanied by disorders which make most favourable conditions **for fermentative and other abnormal products in the complicated chemistry of the gastro-intestinal tract to gain access to the circulation.**

Yet the disease ought not to be considered as entirely due to the auto-toxic substances derived from the alimentary tract.

Probably a number of poisons other than those derived from disordered conditions of the alimentary tract are capable of producing the symptoms of tetany. Tetany seems to be due to poisons which act primarily on the motor cortex. If this be the case, certainly a very large variety of poisons is capable of acting in this selective way upon the motor segment of the brain; for instance, tetany in animals may be elicited by injections of chloroform and ergotin.

Finally, tetany is not infrequently observed accompanying myx-oedema and seems to be associated with the accumulation of mucin in the connective tissues.

Mucin is to be regarded as an intermediary product of general tissue metabolism in the organism, (Poehl's Gewebsathmung) and if it is allowed to accumulate in the body, it might act as a toxic substance, or perhaps merely indicate results of the action of some other poison.

Thus, some examples of tetany may be ascribed to the action of toxic products in nowise connected with disturbances of the alimentary canal.

The form of auto-intoxication resulting from the removal of thyroid glands in dogs seems to be a perfectly typical example of a very severe form of tetany.

The dogs have tonic contractions of the muscles, which soon become universal; there are incessant fibrillary tremors, and if the thyroid has been completely removed, the symptoms are accompanied with a fatal result in a very few hours or days. Through the courtesy of Dr Cunningham of the Department of Physiology in the College of Physicians and Surgeons, I have had an opportunity of studying the nervous system in several cases of experimental thyropravia, with the result of finding an acute universal destructive degeneration of the cortical ganglion cells.

The appearances of such cortical cells are quite like the cytoclastic cells shown in Figure 2, Plate I. Apparently the poison in these cases of experimental thyropravia, in the beginning stages of its production, exerts a selective action upon the motor segment of the cortex.

But as the poison, or poisons accumulate, and become larger in volume, or greater in intensity, spheres of the cortex beyond the motor segment are progressively involved.

And, finally, at the death of the animal, there is this universally acute destructive degeneration of cortical cells as an expression of the chemical reaction between the poison on the one hand and the constituent elements of the ganglion cell body on the other.

In connection with the relation of some forms of tetany to the group of auto-intoxications caused by lesions of the thyroid gland, it is interesting to note that Kobert calls attention to the fact that mannin, a constituent of ergotin, which elicits attacks of tetany when injected in animals, belongs to the carbohydrate group, and resembles mucin.

That the poison of tetany probably, when exceptionally virulent in quality or large in quantity, acts upon other spheres of the cortex beside the motor segment, is shown in the case reported by Loeb.

This was associated with ectasia of the stomach, but besides the purely motor symptoms of tetany, there was a distinct invasion of the sensorium.

There was delirium, apathy and mental hebetude.

The case reported by Wilgus in the second number of the State Hospitals Bulletin is exceedingly interesting, for it certainly appears to be a distinct example of an autointoxication due to a very severe grade of intensity of the toxic substance.

In this case there was not only the purely motor phenomena of Tetany in a most marked and intense degree, but it was also associated with Insanity.

Nor does the rise of temperature in Wilgus case interfere with the interpretation of the symptoms as an expression of an auto-intoxication.

It will be shown presently that sun-stroke itself, with its accompaniment of abnormally high temperatures, is a most brilliant illustration of an auto-intoxication.

I do not hesitate to believe that in the case of Wilgus the results of the action of the poison upon the cortical cells would have shown changes quite the counterparts of the figures 1 and 2, in Plate I.

This author's case, in many ways, is quite the counterpart of the severe, rapidly fatal form of auto-intoxication, which produces tetany such as is seen in dogs deprived of the thyroid gland.

It should be remembered in this connection, as noted above, that such dogs die, provided the thyroid be completely removed, in a very few days, not exceeding 5 to 10.

To Sum Up

Tetany seems undoubtedly to be due to an auto-intoxication; when the poison is small in volume or mild in intensity it exerts a selective action upon the cortical portion of the kinetomeric system, and remains limited, apparently, to the motor zones of the cortex. **Such are the cases of tetany associated with the majority of instances of gastric ectasia, or other derangement of the gastro-intestinal tract.**

When the poison becomes more abundant or more intense its action, while predominantly and initially exhibited by a selective affinity for the motor segment of the cortex, it extends beyond this sphere and involves the ganglion cells of the whole cortex. Such cases as these are of the type reported by Wilgus, of the experimental thyropravia in dogs. It is difficult to determine to what extent tetany may be produced by an inhibition of the functions of the organs, which act as a barrier in antagonizing or nullifying **the Toxic Substances absorbed from the Gastro-Intestinal Tract** under normal or pathological conditions of digestion.

The liver is believed to act in such capacity. And, it is possible, then, that in some cases of tetany in which no visible change in the gastro-intestinal tract has been found on autopsy, **minute changes in the liver may be responsible for the absorption into the circulation of toxic substances** which, under normal conditions of the liver, are nullified in that organ.

The Toxic Power of the Blood in Auto-Intoxications in General

The obscure character of the auto-toxic substances in general and the obscure character of the poisons in the extensive list of insanities probably produced by auto-intoxications, does not interfere with the perfectly definite morphological studies which can now be made. In Case After Case of Mental Disease - it is my belief - that we shall see these traces of the action of a poison in these ever-recurring mutations of cytolysis and cytoclasis of acute, subacute or chronic production. There still remains to be considered beyond this more or less definite category **of Auto-Intoxications, such as Uraemia, Thyropravia, Myxoedema, Tetany, and the later Neural Symptoms in Addison's Disease, a number of obscure Affections of the Nervous System, which point more or less Strongly Toward an Auto-Toxic Origin.**

These cases are as yet very few in number, and their Auto-Toxic character rests only upon an inferential basis, but little by little such cases will accumulate in number. Many of the psychoses will probably be added to them, and in the course of time, there will be a gradual accumulation of more definite proof of their Auto-Toxic character. Examples of these more obscure auto-intoxications of the nervous system are cases reported by Pick and Séglas. **Both of these cases appear to have been associated with auto-intoxications from the alimentary tract. In Pick's case, there was an Atonic Condition of the Stomach, Associated With Many Neurasthenic Symptoms, Manifestations of Physical, and Psychical Depression, Headache, and Rapid Heart Action.**

These symptoms seem distinctly Due to a Poisoning of the Nervous System by an Auto-Intoxication which Took Place Through the Stomach, for The Symptoms Disappeared Absolutely Under an Anti-Fermentative Therapeusis.

I recall the case of a man of intellectual primacy, who has had attacks of mental depression of moderate severity which have occurred over a period of years.

These Attacks Are So Obviously Associated With Corresponding Attacks of Gastro-Intestinal Derangement, that the man himself **has long since learned to associate the two things together. He Can Predict the Occurrence of these Gastro-Intestinal Crises By The Preceding Attacks of Mental Depression.**

The attacks of mental depression have no relation to any adverse condition of his affairs, and almost border on melancholia.

During these attacks, lasting 4 or 5 days, he is extremely depressed, uncommunicative, unable to transact business, and absorbed by the untoward pessimistic attitude which everything in the outside world seems to assume.

All of This Disappears with the Occurrence of the Gastro-Intestinal Crises.

This may seem a common-place episode in our narrative, but it appears to me, that it is merely a question of degree between such an instance, and the initial symptoms of some cases of acute melancholia even with suicidal tendencies.

Seglas reports a similar case, and sees an analogy and sustaining proof in the **Auto-Toxic nature of some of the Psychoses, and Functional Nervous Disturbances in that extrinsic poisons,** for instance, lead and alcohol, **lead to similar forms of Mental Disturbance.**

And I may add from cytologic studies of the nervous system, in both lead and alcoholic poisoning, that **the effect of these poisons on the nervous system is not essentially different from that of several Auto-Intoxications**, namely: Uraemia, Thyropravia, and Insolation.

Both the extrinsic poisons and auto-intoxications, as well as other forms of poisons, show the same result, namely, various phases of parenchymatous degeneration of the Nervous System. Evidence by exclusion is certainly accumulating that a very rare disease of the nervous system, known under the term of periodic family paralysis, is to be ascribed to an Auto-Intoxication.

The disease was first described in 1874, by Hartwig, and has since been observed by Westphal, Oppenheim, and a number of others.

This disease consists in the sudden appearance of paralysis of the extremities at the most irregular intervals. After several hours, or days, this paralysis disappears entirely. There is also corresponding to this temporary paralysis of the extremities, a correlated disappearance and return of the electric excitability of the muscles.

Goldflam ascribes this unique nervous affection to an Autointoxication.

In his case a 17 year old boy had brief attacks of general paralysis, which lasted usually 2 days, and occurred about once a week.

These attacks began by weakness in the legs in the evening, and in the course of the next morning the entire body, with the exception of the head, was paralyzed.

Sensibility was unaltered and reflexes diminished.

At the end of the attack, there was extreme sweating, and motility returned in the reverse order of its appearance; it reappeared first in the arms, then in the trunk, and finally in the legs.

In the family of the mother of the patient 11 members exhibited the same symptoms, both males and females being attacked in the same way.

The disease generally began at the age of between 15 and 20 years.

Goldflam injected the urine of the patient in the ear vein of rabbits shortly after the attack, and also in the interim, and found that the poisons of the urine were much greater during the attack. Between the attacks the urine was hypotoxic, as compared with the condition during the attacks, which was hypertoxic.

If these results with the urine should be corroborated, they would indicate the poison is not of the "retention group of normal waste products," but that the poison develops de novo within the body.

If this affection of periodic family paralysis is an auto-intoxication, it is exceedingly suggestive in exciting suspicion of the auto-toxic nature of the psychoses of periodic development. It is interesting, in connection with **the toxic basis of Epilepsy,** to refer to the experiments of Griffiths, who **found in the urine of an Epileptic a leucomaine which produced general tremors, vomiting, mydriasis, and, eventually, death when injected into dogs.**

Voisin records **hypertoxicity of the urine after Epileptic attacks.**

Rachford, of Cincinnati, has also isolated, **in the urine of a patient with epileptiform manifestations, some of the xanthin and paraxanthin bodies which produced toxic symptoms when injected in animals.**

The increase of neuroglia cells in the sub-cortical zones, which I have found in several cases of Epilepsy, does not at all interfere with the supposition of the auto-toxic origin of this affection.

On the other hand, it is a factor in favour of this basis of Epilepsy, for I can demonstrate that one of the expressions of a chemical reaction between a toxic substance and the more lowly organized neuroglia cells and the meso-blastic connective tissue cells of the nervous system is karyokinesis.

Hence, after the periodical momentary contacts of the nervous system with the poison extending through months and years, a proliferation of the neuroglia cells is to be expected.

How much of a selective action the poisons which produce epilepsy have upon different spheres of the cortex, or to what extent they operate upon the whole cortex uniformly, very little can be definitely said at present.

It would seem most probable, at any rate during the later periods of epilepsy, that **the toxic substances producing Epilepsy operate upon the whole cortex at large.** It has been suggested that **Landry's paralysis is also an example of auto-intoxication of the nervous system.**

The anatomical changes in Landry's paralysis offer no impediment to the acceptance of this view.

Bacterial Toxaemia as a cause for Landry's paralysis.

The Auto-Intoxications due to lesions of the kidneys, Must Be Very Important Factors Indeed, In The Production of Mental Diseases.

Perhaps the clearest and simplest example of **the profound damage that is liable to be wrought upon the nervous system in the acute renal intoxications is eclampsia gravidarum.**

Here is again a signal example of the very prompt effects on the nervous system of a severe, intense poison, and it is accepting but little responsibility to predict that the examination of the cortex in such a case of eclampsia will disclose an acute degeneration of the ganglion cells practically quite the same as shown in Plate I.

This acute, intense, violent poison ought to cause a degeneration of the cells with a tendency toward the destructive type.

This degeneration of the cells is probably present in all cases of eclampsia of any degree of severity, but, as has been repeated so often, acute degeneration of the ganglion cells is not necessarily destructive.

The cell may recover, both in structure and function, from such a degeneration, but, on the other hand, if the poison be too severe or have too persistent an exhibition, the cell may become permanently destroyed.

This is the reason that many of the cases who do recover from eclampsia have a permanently damaged cortex from the acute destructive degeneration of the ganglion cells, and ultimately pass into the hospitals for the insane with one form or another of mental disease.

Very much the same remarks are applicable to the acute uraemias.

In this condition there is also this same acute degeneration of the ganglion cells as an expression of a chemical reaction between the cells and the toxic uraemic products. In most of these cases of acute uraemia, however, clinical history enables one to justly infer that the quality or quantity of **the poison is such that, when it disappears, there may be a restitution of the ganglion cell — a recovery both in function and structure.**

The chronic or persistent forms of auto-intoxications from the kidneys are more complicated and probably have a most important bearing as a direct or indirect factor in the production of mental diseases. In the first place, the intermittent and repeated attacks of uraemia are compatible with a degeneration of the recovery of the ganglion cell after the cessation of the uraemic products.

But, as in the case of the exhibition of alcohol, the recovery of the cell can not be expected to go on indefinitely.

If there is a persistent exhibition of the uraemic poisons, as in chronic alcoholism, eventually the ganglion cell ought to take on some form, however slight, of permanent damage to its structure and function.

In uraemic coma from chronic Bright's disease, I have been able to demonstrate acute degeneration of the cortical ganglion cells practically similar to that shown in Plate I, Fig. 1.

In another case wherein convulsions were a more marked phenomenon of the uraemic condition than coma, only the initial phases of an acute degeneration could be demonstrated in the cortical ganglion cells. Thus, probably, to a degree which is slight, **chronic renal auto-intoxications damage the ganglion cells directly.**

But a second, although indirect, **factor of renal disease, in modifying the action of other poisons in general upon the nervous system, is of very great importance.**

This consists in the impairment of the eliminative capacity of the kidneys when other poisons are introduced into the body.

When the eliminative capacity of the kidney is impaired, and when poisons, either from an extrinsic, or bacterial, or other auto-toxic source, are present in the body, they become invested with much greater significance than in the normal individual.

Such poisons introduced into an individual with chronic kidney disease operate with a much more damaging effect, especially on the nervous system.

They operate for a longer period of time by reason of the impairment of the eliminative powers of the kidney, and the duration of an exhibition of a poison to the nervous system is the fundamental factor in determining whether the resultant acute degeneration shall have a recuperative or destructive termination on the cells.

It is not difficult to realize that a poison from an extrinsic source, a bacterial toxin, or an auto-toxic poison, operates with greater destructiveness on the nervous system in individuals with diminished capacity of elimination through the renal organs.

This was shown most strikingly in our observations on sun-stroke at the Pathological Institute during the past summer.

Quite uniformly **the cases which failed to recover from the auto-toxic poisons of sun-stroke were individuals whose kidneys were considerably damaged.**

In other individuals apparently whose kidneys were normal, the poison or poisons were seemingly rapidly eliminated, and these cases escaped or recovered from the serious acute degeneration of the cortical ganglion cells.

In the group of cases with kidney lesions the poison apparently remained in the body, and as a result there was acute degeneration of the ganglion cells with a destructive tendency. The Auto-Toxic Substances in sun-stroke are such violent and intense poisons that the whole question of recovery or death of the patient depends upon rapid elimination of the poison by the various Emunctories. I can think of no other disease where a normal kidney acts as a greater safeguard in eliminating the poison of such a profoundly virulent type.

Apparently only a few hours are necessary, if the elimination of this poison be interfered with, to produce death or a permanent damage to the nervous system, such as we see in the cases in the hospitals for the insane, who owe their impaired mental condition to an acute, destructive degeneration of the cortical ganglion cells after sun-stroke.

Thus the importance of the kidneys in auto-intoxications and in other groups of poisons in the production of mental diseases may be regarded from 2 standpoints:

1. In the direct action of retention of renal intoxicants on the nerve cell, whether of acute or chronic exhibition, is to be regarded.
2. In the indirect but very important factor which disease of the kidney becomes in interfering with the elimination of other groups of poisons, whether of an extrinsic, bacterial or auto-toxic nature, must be taken into consideration.

Poisons, whose action upon the ganglion cells might readily be recovered from in a normal individual, become much more dangerous to the integrity of the nervous system by reason of their protracted action in individuals with damaged kidneys.

Thus, for instance, in Alcoholism, Typhoid Fever, or Influenza, the liability to damage of the cortical cell is greatly enhanced by diminished eliminative power of the kidneys.

Finally, in chronic lesions of the kidneys, it is not only a question of interference with the protective power of the kidneys in eliminating toxic substances in general, but the condition permits of a combination of poisons, when some other disease becomes engrafted on the body.

There are, in the first place, the auto-intoxications due to the accumulation of materials which are imperfectly excreted by the kidneys; then, if a bacterial toxine be developed in the body in such a case, there is a mixture of two groups of poisons. This brings up one of the most difficult of all of the groups of toxic substances mentioned in the initial paragraphs of this text, viz.: **combinations of Auto-Intoxications, and Bacterial Toxins.**

It is comparatively easy to understand the action of a single poison circulating in the blood, and how such a poison would exert a chemical action upon various body cells, especially the brain cells, and the manifestation of this chemical reaction in acute degeneration.

But very rarely in any of the toxic diseases is the case as simple as this.

In such a disease, for instance, as typhoid fever, there is not only the comparatively simple action of the toxines, elaborated by the typhoid bacillus, but in addition to this, it must be taken into consideration that disturbance of the kidney functions induced by the action of this toxin on the kidney cells exists. Thus, there is, therefore, a combination of poisons which contains at least the toxine of the typhoid bacillus, plus a form of auto-toxic poison, due to the secondary involvement of the kidney.

In the same way in all of the continued fevers or acute infectious diseases, there would seem to be indicated the primary bacterial toxin, associated with all of the auto-toxic products resulting from the derangement of the various secretory organs which have been secondarily damaged by the primary bacterial poison.

From this point of view, any of the acute bacterial diseases becomes a very complicated matter, indeed, by reason of the fluctuations in the volume or **intensity of the primary poisons and the mixtures of the bacterial toxin with the various secondary auto-toxic products.**

Diseases of the kidney must place a very heavy mortgage on the nervous system in the action of poisonings which may happen to the individual in the future. Before leaving this introductory text upon the relation of the auto-intoxications to the nervous system, the subject of eclampsia infantum, myasthenia gravispseudo-paralytica, diabetic coma, and coma carcinomatosum deserve mention.

The Eclamptic Symptoms of children receive the best explanation from the auto-toxic basis.

Reflex Irritation, dentition and vascular fluctuations in the brain and the like, are certainly vague, indefinite explanations of the eclamptic seizures in children, compared with the action on the **motor cortex of auto-toxic substances, derived principally from the alimentary tract.**

Nor is it necessary to conceive that there is any inherent weakness on the part of the brain in children to explain the frequent occurrence of convulsions.

The explanation of the frequent occurrence of convulsions in children would seem to be rather **due to the fact that they are subject to more frequent dietetic errors or digestive derangements than in the adult, and have not completed their education of the functions of the gastrointestinal tract.**

Herter considers this factor in the etiology of eclampsia infantum so uniformly a causative agent, that he bases the success of his antiseptic therapeusis of the gastro-intestinal tract thereon.

Albu relates a case of a ten year old boy in which moderately **severe cerebral symptoms depended so definitely on an auto-intoxication of the gastro-intestinal tract,** that it is well worth relating here.

The boy had frequent attacks of convulsions of such a grade of severity, together with a loss of consciousness, that they well answered the description of hystero-epilepsy.

As a matter of fact, these symptoms were due to a gastro-intestinal auto-intoxication, and were accompanied by a dilatation of the stomach and were regularly preceded by digestive disturbances, which were very easily controlled by treatment. The boy left the hospital several times.

As long as the treatment of the gastric disorder was maintained the boy was absolutely free from the attacks. For some time, as often as he left the hospital, he returned in a brief period with the same set of symptoms. This very commonplace instance, however, of **the action of auto-toxic products from the gastro-intestinal tract shows how almost synonymous are auto-intoxications and symptoms and diseases of the nervous system.**

Practically the only symptoms in this case were those of the nervous system.

The local symptoms were almost unobtrusive. **Diabetic Coma is again an example in all probability of an acute degeneration of the ganglion cells, due to the action of an auto-toxic poison**, as shown in Plate I.

The same is to be said of the coma, often associated with carcinoma of the gastro-intestinal tract, and coma occasionally associated with severe anaemia, miliary tuberculosis, cirrhosis of the liver, senile cachexia, etc.

It is possible for auto-toxic products to exert a selective activity on the muscular system. Jolly describes a symptom-complex under the name of myasthenia gravis pseudo-paralytica, which seems justifiable to place in the category of auto-intoxications. The essential feature of this disease consists in the periodic appearance of paralytic flaccidity of the muscles of the entire body, although the muscles of the extremities are most distinctly involved.

There is very rapid fatigue of the muscles after exertion.

Although muscular activity returns after a period of rest, renewed exertion is accompanied with the same peculiarly rapid fatigue.

Electric excitability corresponds uniformly with the spontaneous stages of rest and fatigue in the muscles.

The serious feature of the disease is the involvement of the muscles of deglutition and respiration, which may lead to a fatal termination.

The most satisfactory illustration in many respects of the whole groups of auto-intoxications is the subject of insolation.

The investigations on sun-stroke at the Pathological Institute in the past summer, during the great outbreak of this disease in New York City, places the autotoxic nature of this disease beyond any conjectural basis.

For it is the most brilliant and straightforward example of an acute, intense, virulent poison originating within the body, which acts most rapidly and violently upon the nervous system.

During the previous summer an examination of a case of insolation convinced me that the acute degeneration of the cortical cells must be due to the action of a poison.

And the memorable outbreak of the affection during the past summer, in New York City, lasting over a week, afforded a unique opportunity for studies to substantiate the toxic theory of the disease indicated by the microscopic appearances in the case of the previous year.

Through Dr Phoebus Levene, Associate in Physiological Chemistry at the Pathological Institute of the New York State Hospitals, an extended series of studies of the effects of the body fluids and excretions of living cases of sun-stroke were made on animals. Repeated injections of the urine in rabbits from several different cases showed uniform hypotoxicity just after the occurrence of the sun-stroke. I**njections of the cerebro-spinal fluid, and ventricular fluids of the brain from the fatal cases produced lethal results in animals.**

But, inasmuch as these animals died when not under observation and some hours after the injection, the results of these experiments can not be given much significance one way or the other. Injections of the blood serum, however, taken from 2 patients during the period of hyperpyrexia, gave most prompt and decisive results. Quantities from 5 to 8 cubic centimeters in volume of this blood serum injected in the ear vein produced uniformly lethal results in 5 animals in succession within 45 to 60 minutes after the injection.

The animals had very violent convulsions, which were usually so severe that they died in the midst of the attacks within 4 or 5 minutes.

There were clonic and tonic convulsions of all 4 extremities, opisthotonos, and, at times, propulsions forward of the whole body. The animals also had a rise of temperature of 2 or 3 degrees in the rectum shortly after the injections of the fluid. This rise of temperature, however, we do not regard as indicative of any particular significance, since it may occur after injections in the ear veins of rabbits with a variety of reagents.

Any one who has had any extensive experience in injecting foreign substances into the ear veins of rabbits, will have noticed not infrequently, that fatal results occur which are due to manipulative procedures, and can not at all be ascribed to the action of the material used.

But there was no mistaking the cause of death which occurred so uniformly in these animals in succession.

This result is in consonance with the hypothesis that the rapidly fatal course in severe cases of sun-stroke, **is due to an intense, rapidly acting poison, circulating in the body fluids.**

If this view be correct, it was to be expected, as was in fact the case, that even the small quanity of blood serum used in the rabbits would produce experimentally this rapid, prompt and fatal effect. Finally in the fourth set of experiments urine from convalescing patients was injected into the blood circulation of rabbits. **This was found to be most decidedly hypertoxic.**

Dr Levene's experiments, therefore, seem to indicate that some toxic product is retained within the body during the initial periods of insolation.

This toxic substance gains access to the blood, and finally it seems that the poison disappears from the blood and is excreted by the urine.

It is not too much to say that the virulence of the auto-toxic poison in some cases of sun-stroke is fully as rapid and violent as snake venom and considerably resembles its action. Cases of sun-stroke which entered the hospitals with purple, swollen faces, rapid and very much enfeebled heart action, and profound collapse, with death occurring within 1 to 2 hours, are surely examples of the effects of the most violent poisons that we know of.

Such a Poison seems immediately to act upon the Ganglion Cells which Govern the Heart, and which Manage the Vaso-Motor Apparatus.

This brings about such a rapid suspension of the most vital functions that the body hardly has a chance, so to speak, to react against or eliminate the poisons.

I have instanced sun-stroke as a most straightforward example of auto-intoxication in this connection to show you again that the traces it leaves on the nervous system are most tangible and distinct.

It is, again, as we shall see so often repeated in acute toxic diseases of the nervous system, generally, a manifestation of acute degeneration of the ganglion cells, such as is shown in Plate I.

And if these changes in the ganglion cells be carefully considered, the whole clinical history of sun-stroke — and this consists largely in manifestations of the nervous system — becomes clear and distinct.

The Delirium, Convulsions, Coma, the Acute Maniacal Condition, practically equivalent in some cases to conditions of Delirium Grave; the Tetanus-like symptoms, the Opisthotonos, tonic and clonic Spasms; the clinical pictures in others which simulate the manifestations of Hydrophobia; and, finally, the permanently Damaged Mental Status which is left behind in many victims of Sun-Stroke who make their way into the hospitals for the Insane: all of these things can be clearly interpreted by the changes wrought in the ganglion cells by this auto-toxic poison similar to the changes shown in Plate I.

In the cases of sun-stroke which terminate in one or another form of Insanity, the acute degeneration of the cortical cells has gone on to a destructive phase.

In the cases which recover in a few hours there is probably little, if any, degeneration in the cortical cells.

There is the temporary action of the poison on the groups of ganglion cells which manage the heart and Vaso-Motor Systems, and when the poison is removed the recovery of the individual is comparatively rapid, and between these two extremes of cases which recover rapidly and cases in which the nervous system is permanently damaged, there are all sorts of gradations in the degree of severity in the acute degeneration of the nervous system.

The source of this Auto-toxin in Sun-stroke is unknown to us, as well as the relations of the poison to the production of the Hyperpyrexia (exceptionally high fever, greater than 41 C., which can occur in patients with severe infections), and also its relation to the cessation of perspiration prior to and during the onset of the attack of insolation. The determination of the Uro-toxicity in these researches on insolation was controlled, as far as possible, by chemical analysis of the urine.

The auto-toxic causation of sun-stroke is based on the toxicity of the blood serum taken from living cases, conjoined with the structural changes in the ganglion cells which show the handiwork of a poison.

We now come to the consideration of the testimony of the auto-toxic basis of mental diseases, along the lines of physiological chemistry, and the physiological testing of the toxicity of the body fluids in animals. **Some of the results of the testing of Uro-toxicity in insanity seem very striking and convincing.**

I have in mind, also, the possibility of the occurrence of toxic products in the urine from the materials formed by disintegration of the nervous system.

Thus, in a chronic auto-intoxication of the nervous system, the urine may indicate the presence of the primary auto-poison, but it may also contain, in addition, substances which come from the cytolysis or cytoclasis of hordes of neurons.

Hand in hand with this, **a large percentage of the energy of the staffs of the State Hospitals should be directed toward the systematic accumulation of the experimental determination of the toxicity of the body fluids, particularly the urine and blood, in the insanities.**

We must try to know all of the variable exhibitions and fluctuations in intensity and duration of these **Auto-poisons in Insanity by Uro-toxic determinations.**

The modification which Gibson in **"Auto-Intoxication and Insanity", was able to produce by subcutaneous injections in a case of Stuporous Melancholia by diluting the body fluids and stimulating the eliminating power of the Emunctories, may be regarded as much better evidence of an Autointoxication** than **many of the instances where Psychic Diseases are so positively ascribed to Auto-Intoxications on premises of uro-toxic determinations.**

A discussion of the subject of the action of Autointoxications of the mother upon the developing foetus is very important in this narrative, which attempts to consider some points in the Toxic Pathogenesis of Mental Disease.

Auto-Poisons must play an important part in the production of protal defects in the nervous system.

Several diseases of the nervous system known (Little's disease or congenital idiocy) or suspected to be due (some forms of Epilepsy, Huntington's Chorea) to protal defects of the nervous system may be really due to the action of auto-poisons. The so-called group of "protal diseases of the nervous system" may then be divested of their obscurity in being placed in the toxic category.

I hope to refer to this matter of the action of auto-poisons on the foetus again in the continuation of this narrative in connection with the histogenesis or embryology of the cytologic elements of the ganglion cells, particularly the chromophilic placques, which I have studied in human embryos, and in the embryos of the tern, pig, acanthias and raia, also in the motor cortex of the cat, dog and human embryos at maturity. Having in this very general way considered some of **the relations of the Auto-Toxic Group of Poisons to the production of Neural Diseases, it would next be in order to discuss in the same way the relation of the other groups of poisons, viz.: Bacterial Toxins, combinations of Bacterial Toxins and Auto-Intoxications, and finally, extrinsic poisons in relation to the production of Neural Diseases."** - Dr Ira Van Gieson, MD, Director State Pathological Institute (selected after a special competitive civil service examination, which embraced a series of questions in general pathological anatomy, the architecture of the nervous system, minute anatomy of the nervous system, pathological anatomy, technique and methods of neural investigation and the lines of research to be applied to the study of the Pathology of Insanity, Dr Van Gieson, MD, has been connected with the Laboratory of the College of Physicians and Surgeons in New York City, for 10 years as an Instructor in normal Histology and Neurology), in "Remarks on the Scope and Organization of the Pathological Institute of the New York State Hospitals", The State Hospitals Bulletin, October 1896.

Lacteals Are Important Structure of the Lymphatic System - Study in Detail

Lacteals

"Lacteals are the Central Lymphatic Vessels in the villi of the small intestine and perform nutrient absorption, especially Dietary Lipids, and the transportation of antigen and antigen-presenting cells.

Lymphatic Endothelial Cells

Remodeling, Proliferation, and Cell-Cell Junctions of Lymphatic Endothelial Cells (LECs) in lacteals Are the Basis of the Maintenance of Lacteal Integrity and Dietary Lipid Absorption. Normal Lipid Absorption in the Diet Depends on Sound Lacteal Development and Proliferation, especially integrity maintenance. Namely; maintaining the appropriate proportion of button-like and zipper-like junctions. Maintaining the integrity, and transforming button-to-zipper junctions in lacteals **are strongly connected with obesity, which could be Regulated by Intestinal Flora,** and molecular signalings. **The Majority of Nutrient Uptake is Absorbed in the Small Intestine**, such as: Carbohydrates, Protein, Vitamins, and Lipid. Of these, **the Lymphatic Vasculature of the Intestine plays an Essential Role in lipid absorption.**

Lymphatic Vascular System

The Lymphatic Vascular System is closely related to immune functions and transporting dietary lipids from the small intestine. Lacteals are Lymphatic Capillaries in the Small Intestine that absorb dietary lipids and participate in the gut immune response.

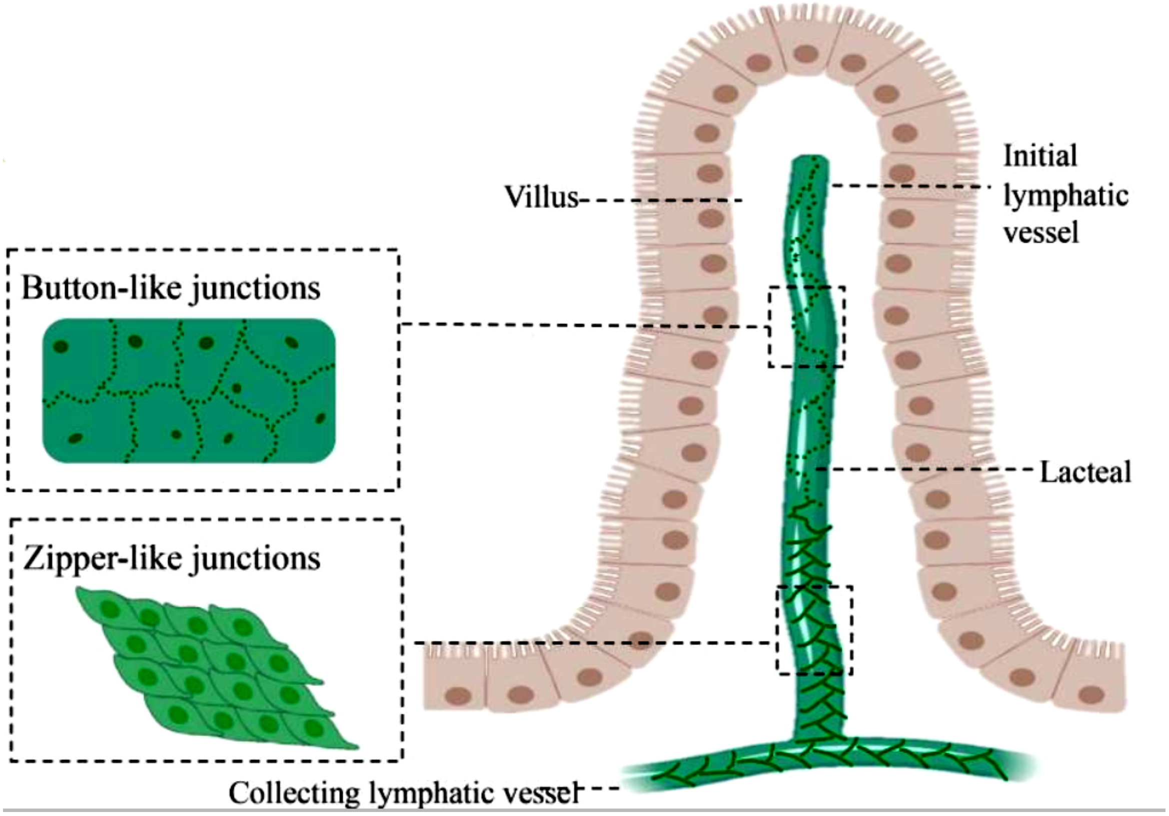
Regenerative and Proliferative Characteristics

Lacteals have Regenerative and Proliferative Characteristics, distinct from embryonic lymphangiogenesis or quiescent lymphatic vessels in other tissues. There are 2 lacteals in the duodenum and proximal jejunum villi (on average), whereas most residual small intestine villi have only 1 lacteal, and the length of the lacteals shortens gradually with decreased villus length from the proximal duodenum to the distal ileum. The lacteal size accounts for 60% to 70% of the villus length in different intestinal segments.

Lipid Uptake in Lacteals

The Lymphatic System devotes itself to Dietary Lipid Uptake to provide Energy to the Whole Body. Practically, Major Dietary Lipids Are Transported

From The Lymphatic System into the Blood through chylomicrons in Lacteals of the small intestine. The Proximal Duodenum Is The Uppermost Place To Absorb Dietary Lipids hydrolyzed by gastric, and pancreatic lipases. Then, the products mix with liver-derived bile acids to comprise free fatty acids (FFAs) monoglyceride micelles. Angiopoietin-like 4, a secreted glycoprotein, inhibits lipoprotein lipase, and **regulates lipid uptake to prevent Enterocyte Lipid Overload in the Intestine (occurs when the small intestine's absorptive cells take in more fats than they can process or secrete; this leads to an excessive buildup of triglycerides in cytoplasmic lipid droplets, contributing to postprandial lipemia, insulin resistance, and Systemic Metabolic Disorders).**



The small intestine has a powerful function in lipid absorption and immunosurveillance of gut microbiota, mainly depending on lacteals. In the clinic, **Lacteal Dysfunction Results In Defective Nutrient Absorption**, such as protein-loss enteropathy-induced systemic lymphopenia, hypoalbuminemia, and hypogammaglobulinemia, because of serum protein loss in the gastrointestinal tract. **In clinical Inflammatory Bowel Diseases, Crohn's Disease is thought to be Related to Intestinal Lymphangiectasia, with Increased Intestinal Lymphatic Capillary Permeability During Inflammation. In Colorectal Cancer, patients without distant metastases, the Status and Number of Lymph Nodes Are Associated With Disease Outcome And Patient Survival."** - in "**The Role of Lacteal Integrity** and junction transformation in obesity", Frontiers in Endocrinology, November 2022.

The Critical Role of Lipid Metabolism in Health and Diseases

Lipids

“Lipids make up 10–20% of the human body, and serve as Crucial Energy Storage substances as well as essential components of cell membranes.

Physiologically, lipids are involved in regulating cellular structure and function, signaling pathways.

Free Fatty Acids

Excess systemic Free Fatty Acids (FFAs) - are lipid molecules unattached to other compounds -, and Dietary Lipids (fats) - are macronutrients essential for energy production, cell membrane structure, and hormone synthesis - enter cells within non-adipose organs such as the liver, muscle, pancreas, and placenta, where they are deposited as ectopic fat, generating lipotoxicity.

Chronic Nutritional Excess

Chronic Nutritional Excess (overnutrition occurs when the intake of calories and nutrients consistently exceeds the body's metabolic demands), can lead to the accumulation of lipid metabolites, such as diacylglycerols, ceramides, and free fatty acids, which exacerbate lipid deposition and result in the onset of type 2 diabetes mellitus. Therefore, abnormal levels or the dysregulated accumulation of lipids within tissues are often associated with various diseases, including obesity, type 2 diabetes, non-alcoholic fatty liver disease, neurodegenerative diseases, infections, and cancer.

Maintaining normal levels of lipid metabolism is crucial for overall health.

This Special Issue of Nutrients, entitled “Dietary Lipid, Adipose Tissue and Lipid Metabolism in Health and Diseases”, aims to highlight **the significance of lipid metabolism in human health and disease.**

It seeks to elucidate the regulatory roles of key tissues and organs, including the intestine, liver, adipose tissue, muscle, pancreas, and placenta, in maintaining whole-body homeostasis.

Lipids are typically closely associated with clinical manifestations, and some can even directly reflect the clinical conditions.

In this Special Issue, we present several studies **focusing on dysregulated lipid levels that contribute to the exacerbation of pathological conditions.**

Elucidating the associated relationships and uncovering causal links in lipid metabolism are crucial for the effective targeting of adipose metabolism to improve human health.” - in **“The Critical Role of Lipid Metabolism in Health and Diseases”**, Nutrients, 23 December 2024.

Nutrient Overload

"The Onset of Multiple Types of Diseases Occur Due To Consuming Too Much Food. The prevalence of Obesity was 13%, and Overweight was 39% (total of 52% of the Population) worldwide in 2016.

Obesity-related metabolic diseases, including cardiovascular diseases, atherosclerosis, insulin resistance and type II diabetes, even certain types of cancer, are the leading causes of preventable and premature death.

Modern Diet Pattern and Physical Inactivity

> *"Nutrient Overload occurs worldwide as a consequence of the Modern Diet Pattern and the Physical Inactivity that sometimes accompanies it. Overnutrition-induced changes in key organelles and sensors rewire cellular bioenergetic pathways and facilitate the shift of the metabolic state toward biosynthesis, thereby leading to the onset of various metabolic disorders, which are essentially the downstream manifestations of a misbalanced metabolic equilibrium." - in "Impact of nutrient overload on metabolic homeostasis", Nutrition Reviews, September 2018*

Understanding how Nutrient Overload affects human metabolism on a cellular level provides additional insights in the prevention and treatment of these diseases.

Metabolic Diseases Are Preventable

It is important to note that Metabolic Diseases Are Preventable, as Cardiovascular Diseases and Obesity can be prevented by Eating a Healthy Diet, which also are inherently micronutrient rich.

Therefore, these foods (Functional Foods and Nutraceuticals) may be as pre-emptive or preventative solution against various metabolic stressors." - in "Chronic nutrition overtake can lead to the onset of multiple diseases", Nutrition Reviews, 19 November 2018.

Inflammatory Bowel Diseases And Metabolic Disorders

"Inflammatory Bowel Diseases and Metabolic Disorders are increasingly recognized as interconnected conditions that frequently coexist and influence each other's clinical course.

Accumulating evidence indicates that patients with Inflammatory Bowel Disease face a substantial burden of obesity, metabolic syndrome, metabolic dysfunction-associated steatotic liver disease, osteoporosis, and Diabetes Type II.

These Associations appear to be driven by Shared and Interacting Mechanisms, including:

1. **Intestinal Barrier Disruption.**
2. **Gut Microbiota Dysbiosis.**
3. **Chronic Systemic Inflammation.**
4. **Adipose tissue-mediated immunometabolic pathways.**

Bone Loss in Inflammatory Bowel Disease appears to result from a complex interplay of cytokine-driven bone resorption, impaired bone formation, and Nutritional Deficiencies. Malabsorption and Nutritional Deficiencies Substantially Contribute to Inflammatory Bowel Disease-associated Osteoporosis.

Vitamin D Deficiency is highly prevalent and may promote bone loss through Reduced Calcium Absorption, impaired osteoblast function, and loss of its immunomodulatory effects.

Dietary and environmental factors have been suggested as potential modulators of immunometabolic interactions, **acting via changes in Microbiota Composition, Epithelial Barrier Function, and immune and metabolic signaling networks.**

Urban living has been associated with higher Exposure to Pollutants and Reduced Microbial Diversity, which correlates with increased risk of both Inflammatory Bowel Diseases and Metabolic Disorders through mechanisms involving chronic low-grade inflammation and immune dysregulation.

Pharmaceutical Antibiotic exposure Disrupt Microbial Diversity, favouring pathogenic bacteria and reducing protective species, leading to Dysbiosis, which is implicated in both Inflammatory Bowel Disease, and Metabolic Syndrome.

Physical Activity has been inversely Associated with the development and progression of both Inflammatory Bowel Disease and metabolic disorders. The protective effect appears to be mediated through multiple interacting mechanisms, including attenuation of systemic inflammation, favorable modulation of the gut microbiota, improvement of metabolic parameters, and enhancement of intestinal barrier integrity.

In Inflammatory Bowel Disease, moderate-to-vigorous physical activity has been linked to reduced incident disease risk.

Metabolic Abnormalities and Intestinal Inflammation share common pathways involving gut barrier dysfunction, microbiota alterations, immune activation, and adipose tissue-driven meta-inflammation.

These overlapping mechanisms help explain the increased burden of Obesity, Metabolic Syndrome, Steatotic Liver Disease, Osteoporosis, and Type 2 Diabetes observed in patients with Inflammatory Bowel Disease." - in "Metabolic Disorders and Inflammatory Bowel Diseases: Unraveling Shared Pathways and Clinical Interactions. Metabolites", 9 March 2026.

Inflammatory Bowel Syndrome and Abnormal Intestinal Metabolism

> *"**When I think of Inflammatory Bowel Syndrome (IBS), and Abnormal Intestinal Metabolism (highly bidirectional).** I increasingly blame NETosis (overproduction or impaired clearance of Neutrophil Extracellular Traps (NETs) - a web-like structures composed of Histones, and antimicrobial proteins released by **Neutrophils [the most abundant type of white blood cell] during an immune response) dysregulation (exacerbated NETosis induction and impaired Neutrophil extracellular trap clearance) in response to pathogenic infections and/or other Toxic Triggers, including Poor-Quality Nutrition High in Sugar and Other Toxic Additives.** We also need better Treatments to help protect the Gut Lining, and Vasculature (the complex network of blood or lymph vessels in an organ or the entire body; includes arteries, veins, capillaries, and is responsible for transporting oxygen and nutrients to tissues, removing waste, and supporting immune function) from chronic NETosis dysregulation due to Septicemia, and other Comorbid Causes, such as diabetes." - Jim Hoffman, in "LinkedIn", February 2026.*

> *"The exploration of Neutrophil extracellular traps have expanded from in vitro observation to in vivo organ level, and engaged in many specific disease areas, such as systemic lupus erythematosus, vasculitis, diabetes, thrombosis, and lung injury Recent studies have found that **Neutrophil Extracellular Traps (NETs) Were Related To Intestinal Diseases."** - in "The emerging role of neutrophilic extracellular traps in intestinal disease", Gut Pathog., 22 June 2022.*

"Neutrophils are the most abundant immune cells and the fastest recruitment cells in infected or inflammatory sites, so they constitute the first line of immune defense of the human body. They have a variety of immune functions, including phagocytosis, production of Reactive Oxygen Species (ROS unstable, Oxygen-containing molecules that easily react with other molecules in a cell), degranulation and formation of Neutrophil Extracellular Traps. Neutrophil Extracellular Traps have been originally described as the host defense mechanism that used to capture or kill pathogenic microorganisms for neutrophils.

Neutrophil Extracellular Traps and Sepsis

> ***"We have known that Ischemic Stroke leaves patients dangerously vulnerable to infection, one of the leading causes of death in the weeks after the event. Why does the immune system go quiet after a stroke? The answer may be floating in the blood."** - Biotech Support Group, in **"Immune System Goes Quiet After Stroke Due to Lipids in Blood"**, LinkedIn, June 2026.*

In the development of Sepsis, Neutrophils (white blood cells) migrate from circulating blood to infected tissues and mediate the formation of Neutrophil Extracellular Traps (which kill pathogens).

Neutrophil Elastase

Neutrophil Elastase (NE) is a powerful serine protease enzyme stored in the granules of Neutrophils). Its primary function is to break down foreign proteins, destroy bacterial cell walls, and remodel tissues to fight infections.

Neutrophil Extracellular Traps and Intestinal Ischemia Reperfusion Injury

Intestinal Ischemia Reperfusion injury is a phenomenon in which intestinal injury is aggravated by restoration of blood flow based on Intestinal Ischemia (occurs when blood flow to the intestines slows or stops, often due to blocked or narrowed artery; this Deprives the Tissue of Oxygen, and can cause permanent bowel damage, severe, sudden abdominal pain is the hallmark symptom) from various causes, and even irreversible injury occurs, often after shock, trauma, acute Intestinal ischemia and intestinal transplantation.

Following clinical occurrence of Intestinal Ischemia / Reperfusion Injury, it often Gives Rise to Intestinal Bacterial Translocation, endotoxin emigration, and massive release of inflammatory cytokines leading to liver, kidney, lung, and other multi-organ damage, which in turn causes systemic inflammatory response, systemic multi-organ dysfunction syndrome, multi-organ and tissue failure, and even death. Recently, an increasing number of reports have proved that the gut commensal microbiota serves an essential role in mitigating organismal injury in acute mesenteric ischemia. Regarding the additional link between the formation of Neutrophil Extracellular Traps and Gut Microbes, a study by Liang et al. in 2019 revealed that oral administration of Staphylococcal nuclease (SNase), was capable of effectively degrading Neutrophil Extracellular Traps in vitro and in vivo, **thereby improving Intestinal Barrier Function.**

More importantly, Staphylococcal nuclease alleviated the intestinal inflammatory microenvironment and averted the development of Diabetes Type I, in Non-Obese Diabetic mice by altering the species richness and composition of the intestinal microbiota of Non-Obese Diabetic mice." - in "The emerging role of neutrophilic extracellular traps in intestinal disease", Gut Pathog., 22 June 2022.

Neutrophils (White Blood Cells)

Neutrophils help the immune system fight infections and heal injuries. Neutrophils are the most abundant type of White Blood Cell in the human body and serve as the immune system's first line of defence.

Neutrophils circulate in the bloodstream, rapidly rushing to sites of infection or injury to capture and destroy invading bacteria and fungi.

"Neutrophils are the first line of defence of the immune system against infection. Among their weaponry, they have the ability to mix and extrude bactericidal molecules creating NET-like structures in a unique type of cell death called NETosis. This process is important in order to control extracellular infections limiting collateral damage. Its aberrant function has been implicated in several human diseases including Sepsis, and Autoimmune Disease

(N)ETosis

Polisegmented granular cells are the immune system's first line of defense against infections. They have been considered short-lived cells with unspecific functions of phagocytosis, granular secretion, and the production of Reactive Oxygen Species (ROS). This knowledge has been challenged by several lines of evidence, including the formation of Extracellular Traps (ET), a defense mechanism consisting of the extrusion of intracellular material in the form of Neutrophils Extracellular Traps (NETs) to the surrounding extracellular medium in order to concentrate antibacterial substances and snare invading microorganisms; such a process is often accompanied by cell death.

Human neutrophils constitute the first line of defense of innate cellular immunity. **As the most abundant subtype of Leucocytes in peripheral blood, they constitute approximately 70% of these cells. They are terminally differentiated cells with a life span of 12 to 15 hours, whom after this time period undergo apoptosis: this life span can be extended after exposition to several substances like cytokines."** - in "NETosis", Autoimmune Dis., 2013.

Lipid Metabolism in Homeostasis And Disease

"Lipid Metabolism is essential for maintaining cellular homeostasis, and its dysregulation is linked to various diseases, including:

Cancer; Cardiovascular Disease; Diabetes.

Immune cells, such as macrophages, T cells, B cells, and neutrophils, rely on lipid metabolism for their function, which impacts both innate and adaptive immune responses. **Understanding how lipid metabolism influences immune cells is crucial. Lipids, including Fatty Acids (FAs), cholesterol, phospholipids, and triglycerides, are essential for maintaining physiological functions,** such as energy storage, membrane structure, and cell signaling.

Lipid Metabolism, which involves the synthesis and degradation of lipids, plays a Vital Role in Cellular Homeostasis, and disruptions in lipid metabolism are associated with various pathological conditions. Recent research has highlighted lipids as key regulators of cellular function, particularly in immune cells, where lipid metabolism affects immune responses, cell phenotypes, metabolic pathways, and cytokine levels. **This influence can profoundly affect their functions under both healthy and disease conditions.**

Lipid Metabolism in Cancer

Tumors undergo metabolic transformations that enable unchecked proliferation and gradual spread throughout the body, endangering human health. Abnormal lipid metabolism influences cancer progression, as increased synthesis or uptake of lipids accelerates the rapid proliferation and metastasis of cancer cells.

Lipid Metabolism in Neurodegenerative Diseases

Neurodevelopmental Disorders or Neurodegenerative Diseases are increasingly acknowledged as significant contributors to morbidity and mortality. Abnormal Lipid Metabolism can affect normal brain development and function, as well as the survival, function, and communication of nerve cells, thereby promoting or exacerbating the development of Neurodevelopmental Disorders or Neurodegenerative Diseases, suggesting the importance of lipids and their metabolites in Neurodevelopmental Disorders or Neurodegenerative Diseases. Alzheimer's Disease, and Parkinson's Disease are influenced by Short-Chain Fatty Acids (SCFAs), which can affect psychological functions, including emotions and cognitive processes, by crossing the Blood–Brain Barrier and influencing brain metabolism. DHA (Docosahexaenoic Acid is an essential omega-3 fatty acid crucial for brain health, eye development, and heart function, it is highly concentrated in the human brain and retinas) provides neuroprotection by reducing Aβ deposition in Alzheimer's Disease mouse models.

Dietary administration of Docosahexaenoic Acid can lower lipid peroxides and Reactive Oxygen Species (ROS) in cortical hippocampal tissues, improving cognitive impairments.

Disruption of Cholesterol Metabolism in the Brain Is Correlated with Neurodevelopmental Disorders or Neurodegenerative Diseases.

The Brain (which contains approximately 25% of the body's total Cholesterol), Primarily Stores Cholesterol in the myelin sheath, astrocytes, and neuronal cell membranes. Brain Cholesterol is believed to be crucial for maintaining cell morphology, neuronal transmission, and synaptic formation.

Lipid Metabolism in Cardiovascular Diseases

Cardiovascular Diseases are major contributors to global morbidity and mortality, with atherosclerosis-induced ischemic heart disease and stroke being the primary causes of death. Lipid Metabolism products play a key role in Cardiovascular disease, as they mediate immune responses and affect the functionality of leukocytes, blood vessels, and heart cells, thus influencing the vasculature and heart. **Therefore, understanding the function and mechanism of lipid metabolism in the pathogenesis of Cardiovascular Diseases.**

Lipid Metabolism in Aging

Aging is characterized by **systemic chronic inflammation accompanied by cellular aging, immunosenescence, organ dysfunction, and age-related diseases.**

Numerous pathways regulating lifespan have been identified. Notably, many of these regulatory pathways are associated with lipid metabolism. Lipids also function as signaling molecules that actively modulate Lifespan and Healthspan.

Metabolic Disorders

Metabolic Disorders are a group of diseases caused by abnormal metabolic processes within the body, including obesity, metabolic syndrome, and fatty liver disease. Fatty liver disease is driven primarily by excessive lipid accumulation. Metabolic Dysfunction-Associated Steatotic Liver Disease, previously known as Nonalcoholic Fatty Liver Disease, affects approximately 25% of the global population. **The pathogenesis of Metabolic Dysfunction-Associated Steatotic Liver Disease involves various metabolic disturbances, including lipid metabolism disorders, insulin resistance, obesity, and metabolic syndrome, which promote inflammation in the liver and increase the risk of cirrhosis and hepatocellular carcinoma.**

Conclusion

Most diseases, such as: autoimmune diseases, cancer, and obesity, are associated with abnormalities in lipid metabolism.

Lipid metabolic profiles can reveal specific metabolic patterns that are closely related to the clinical manifestations of the disease.

Lipid Metabolism and signaling within immune cells constitute a fundamental regulatory axis that orchestrates immune homeostasis, significantly influencing physiological responses and disease pathogenesis.

Another significant revelation is the complex interaction between host lipid metabolism and microbiome-derived metabolites.

Gut Microbiota-generated Short-chain fatty acids, and Bile Acid derivatives continuously reshape hepatic lipid synthesis and systemic immunometabolic circuits (Restoring the Intestinal Bile Acid Pool requires repairing the complex Gut-Liver Axis. This relies on restoring the specific microbiome populations that metabolize and recycle primary bile acids into secondary bile acids.

It is achieved by targeting 3 main pathways:

1. Promoting Bacterial Diversity.
2. Accelerating Mucosal Healing.
3. Optimising Enterohepatic Circulation).” - in “Lipid Metabolism in Homeostasis and Disease”, Signal Transduction and Targeted Therapy, 16 February 2026.

Bile Acid Flow

"Bile Acid Malabsorption or Bile Acid Diarrhea; complicates more than 30% of Crohn's Disease. Bile Acids are hepatocyte-derived steroidal molecules essential for lipid emulsification and metabolic signaling. After hepatic conjugation, Bile Acids enter the Duodenum where 95% Undergo Efficient Ileal Reabsorption via the Enterohepatic Circulation. The residual Bile Acid flow into the colon, undergoing microbial biotransformation including deconjugation, dehydrogenation, and dihydroxylation to generate secondary Bile Acids such as Deoxycholic Acid and Lithocholic Acid. This microbial processing is critical for Bile Acid pool homeostasis and receptor-mediated signaling. In Inflammatory Bowel Disease, which encompasses Crohn's Disease and Ulcerative Colitis, ileal even ileocolonic inflammation or resection, and backwash ileitis disrupt Bile Acid reabsorption, leading to excessive colonic Bile Acid influx.

Reconstruction of Gut Microbiota

The Reconstruction of Gut Microbiota and Relative Metabolism through Fecal Microbiota Transplantation can Bring Benefit to Many Diseases categorized into 8 domains in clinical practice, including:

1. **Gastrointestinal Disorders.**
2. **Infections.**
3. **Metabolic Disorders.**
4. **Microbiota-Gut-Liver Axis.**
5. **Microbiota-Gut Brain Axis.**
6. **Oncology (Cancer).**
7. **Hematological Disorders (conditions that affect the blood, bone marrow, spleen, or lymphatic system), and other diseases such as;**
8. **Chronic Obstructive Pulmonary Disease.**

We found that in Bile Acid Malabsorption group, the long-term efficacy of Fecal Microbiota Transplantation was more obvious, with a sustained higher rate of clinical response (66.67%) and clinical remission (52.38%) even 3 months after Fecal Microbiota Transplantation. Importantly, the intervention with Fecal Microbiota Transplantation from healthy donors demonstrated a Remarkable Reversal of the Bile Acid-induced exacerbation of colitis.

The improved histopathological and colonoscopic outcomes following Fecal Microbiota Transplantation suggested that the Gut Microbiota Plays a Crucial Role in Mitigating the Inflammatory Primary Bile Acids (such as cholic acid and chenodeoxycholic acid) shifts the gut environment, altering signaling pathways." - in "Fecal Microbiota Transplantation improves bile acid malabsorption in patients with inflammatory bowel disease: results of microbiota and metabolites from two cohort studies", BMC Med., 1 September 2025.

Intestine Organization and Function

"The Intestine Performs A Vital Function In Absorbing Nutrients, and Conducting Immuno-Surveillance of the Gut Bacteria.

Many publications; have detailed the Influence of Intestinal Microbiota on Body Homeostasis and Diseases.

Food absorption and the intestinal microbial and food antigen burden has probably resulted in stromal adaptation, including development of specialized fibroblasts and blood endothelial cells, and **the evolution of gut immune cells to maintain tolerance and control infection.**

In mammals and birds, **the small intestine is covered by finger-like villi that protrude into the lumen.**

The colon, where villi are absent and there is a flat luminal surface, is the site for liquid absorption from faeces and also harbours the majority of commensal bacteria, which are essential for human health.

Intestinal crypts, embedded in the submucosa between villi, contain intestinal stem cells and transit-amplifying cells that maintain the epithelium by providing cells to continuously migrate in an escalator-like fashion from the crypt to the villus tip.

Intestinal stem cells also give rise to all differentiated cells including: enterocytes, responsible for nutrient absorption; Paneth cells, important for antimicrobial defense; mucus-producing goblet cells; and enteroendocrine cells, which secrete hormones.

The intestinal lamina propria, which underlies epithelial cells, contains scaffold-forming connective tissue and comprises blood and lymphatic vessels, enteric nerves, as well as fibroblasts and smooth muscle cells (SMCs).

The lamina propria is densely packed with immune cells, making the intestine one of the largest immunological organs in the body.

The intestine also incorporates organized gut-associated lymphoid tissue, comprising Peyer's Patches, aggregates of lymphoid follicles and isolated lymphoid follicles (cryptopatches).

A thin layer of smooth muscle, the muscularis mucosae, separates the mucosa from the dense connective tissue of the submucosa, which contains a network of blood and lymphatic vessels and a plexus of parasympathetic nerves.

Two muscle layers, consisting of either circular or longitudinally aligned SMCs, line the submucosa.

The outer layer of the intestine, the serosa, is composed of loose connective tissue and covered by mesothelial cells.

The serosa is continuous with the mesentery, a thin membrane supporting the intestine, and the peritoneum.

Lymphatic Vessel Organization

The lymphatic vasculature is a one-way drainage system for interstitial fluids and immune cells, organized into a network of capillaries and collecting vessels.

Interstitial fluid drains into blind-ended, permeable lymphatic capillaries forming lymph; lymphatic collecting vessels transport lymph through Lymph Nodes to the thoracic duct, and back into blood circulation.

Capillary Lymphatic Endothelial Cells (LECs), are connected by discontinuous cell–cell button junctions that form flap valves promoting one-way entrance of lymph and cells into the capillaries.

Lymphatic capillaries lack mural cells (SMCs and pericytes), but are attached to the extracellular matrix by anchoring filaments.

Unlike capillaries, lymphatic collecting vessels are much less permeable due to continuous cell–cell zipper junctions junctions, and are covered by SMCs, which pump collecting vessels for lymph transport.

They also contain numerous intraluminal lymphatic valves, which prevent lymph backflow.

Intestinal Lymphatic Organization

The Crucial Role of Intestinal Lymphatic Vessels has been illustrated by studies of mice expressing the diphtheria toxin receptor under control of the Lymphatic Vessel Endothelial Hyaluronic Acid Receptor 1 (Lyve1) promoter.

Although lymphatic capillaries of all tissues express LYVE1, diphtheria toxin administration selectively ablated only intestinal and Lymph Node lymphatics within 24 hours.

Loss of Intestinal Lymphatics resulted in Severe Gut Inflammation, Sepsis and 100% lethality by 60 hours, Highlighting an Outstanding Role of Intestinal Lymphatics." - in "Intestinal lymphatic vasculature: Structure, mechanisms and functions", Nature Reviews Gastroenterology & Hepatology, June 2017.

"Lymphatic vessels contribute to the function of the lymphatic system in the mammalian body. The distinct structure at the cellular level allows lymphatic vessels to absorb the Interstitial Fluid (Lymph) in peripheral organs and to drain lymph to the blood circulation.

Lymphatic vessels play an essential role in promoting active immune surveillance in conjunction with Lymph Nodes.

New lymphatic vessel growth (called lymphangiogenesis) is induced in several pathological conditions such as chronic inflammation or tumor progression.

Emerging evidence from experimental animal models shows that lymphatic transport is impaired in chronic inflammation.

Tumor associated lymphangiogenesis promotes enhanced metastasis to draining Lymph Nodes and beyond in experimental tumor models.

Blood and Lymphatic Vessels in the Skin

Blood flow, the major circulation in the mammalian body, delivers Oxygen, Nutrients, and Cells to the Peripheral Organs. In the Skin, Blood Vessels underlie the Epidermis that represents a shield for the whole body.

Conversely, lymphatic vessels absorb interstitial tissue fluid and macromolecules that arise from the epidermal cells in physiological conditions and further play a key role in promoting immune cell responses in pathological conditions such as inflammation and tumor progression." - in "Lymphatics in nanophysiology", Advanced Drug Delivery Reviews, 30 July 2014.

Sepsis may gain admission by means of the blood and lymphatics.

Septic foci, such as are found in Carious Teeth or Intestinal Toxaemia, are a source of infection.

A Pure Mind In A Pure Body, That Is Health

"The Antiseptic Treatment, with Carbon and other remedial means, for the cure of incipient Consumption, Indigestion and Nervousness.

The Foundation Causes of which are often laid in Early Life.

In the following diseases, as well as in many other cases, the Antiseptic Treatment has proved itself, wonderfully curative in Asthma of the worst form, in aged people and others; in Chronic Diarrhoea of 1, 2, 5, and 10 years standing, Ulcerations of the Stomach, Uterus, Intestines and Liver.

In Liver Complaints and Jaundice, it improves the complexion, rendering it white and clear; in Cutaneous Disorders; a restorative and an invigorator to Children, Purifying the Stomach and Intestines, removing Worms — preventing their formation.

The above, and other advantages are attendant upon this treatment, proved by the author's experience.

This treatment has no injurious effects, but is harmless and healing to the most delicate constitutions.

In Leviticus, washing the body is commanded in certain impure conditions.

Water, duly administered, is a Healing Medium, the law of which is eternally established in nature, and was ordered by God for the health of the body, and was enjoined to be administered in certain unhealthy, unholy conditions of man.

No one can treat disease successfully unless he understands the spiritual and moral causes which may have contributed to bring about the state of ill-health of the sufferer, as well as the physical causes, which have added their share.

If wise, he feeds on wholesome diet.

The most effectual remedy for impure breath, and a disordered and putrid state of the stomach, is my antiseptic treatment of carbon, with other anti-putrescent means and conditions.

The Value of Proper Food is but little understood.

The Food, being the fuel, should all be consumed by the Oxygen of the air, which causes its combustion; that which is not thus consumed, ferments or decays, and increases any diseased action which may be in the body.

Carbon will arrest the putrescent conditions.

Disease Is Likewise A State of Decay.

By the same Antiseptic Action Disease is arrested, for Disease Is Not a Part of the Living Organism, but is a departure from it.

To Cure It, You Must Arrest the Decay.

If the Cause be Diseased Action, You Must Change That Action.

If excitement, irritation or wounded sensibility, or if cold is the cause of disease, It Must Be Cured By Removing The Cause, and the Vital Principle Will Heal, and Build Up the irritated parts.

If we inquire and investigate the cause of the disease in man, we invariably find its constitutional origin is in the violation of law; the law of Nature and the law of God in the Scriptures, which is a law given by God to man.

The Law of Nature is the law of instinct followed by the animal creation; but society neglects to observe both of these." - Dr W. Evans, MD, in "A Pure Mind in a Pure Body, that is Health", 1863.

Chapter 13

Sound in Reviving Blood Cells

"Pythagoras said that Music could be used in place of medicine.

It got my attention, and I thought, there must be some experiments that could be conducted, where we can carefully measure the response of music to some sort of healing situation. The first experiment that I conceived of was using blood. You take a vial of blood and you place it into an incubator with a small loudspeaker in the incubator, that's feeding music to that blood at the same time that that's happening. We have another vial of the same blood we have a Faraday Cage which is electromagnetically screened, but it's also a very very quiet environment. So that blood is not receiving any music, it's just receiving quiet.

We go through a protocol that first dilutes the blood, by a certain ratio with a buffer solution, and then we extract a small amount of that mixed blood, when we put that blood into the cell counter it will tell us how many cells are actually alive, and what the term is viable.

The cells in the Faraday Cage, have not fared very well, at all, mostly dead.

I hope you can see this, dilute the sample, more cells alive than the cell counter can count. That's a huge difference between the music, and the quiet.

Cells that are transiting towards being dead, have been actually re-enlivened to the extent that so many of them are now alive, really wonderful an amazing result, absolutely amazing. When we have a heartbeat, it creates a pressure wave, and that allows the hemoglobin molecules take in some oxygen from the blood. The low frequencies from the human voice, create the similar sort of pressure waves that allows the blood to uptake the oxygen." - Dr John Stuart Reid, Acoustic Physics Researcher, in "The 1 Field", 2019.

> ***"Documented evidence shows the Power of Music, can be tapped to Heal the Body, Strengthen the Mind, and Unlock the Creative Spirit. Published papers and journal articles offer dramatic accounts of how doctors, musicians, and healthcare professionals use Music to deal with everything from: Anxiety to Cancer, High Blood Pressure, Chronic Pain, Dyslexia, and even Mental Illness. During Childbirth, Music can relieve expectant mothers anxiety and help release endorphins, the body's natural painkillers, and thereby dramatically decrease the need for Anaesthesia. Exposure to sound, Music, and other acoustical vibrations can have a lifelong effect on health, learning, and behaviour, for such exposure stimulates Learning and Memory*** *and strengthens one's listening abilities." - in "Music Therapy", The Fountain Magazine, 1 October 2002.*

The 4 Postulated Laws of Cymatics

> *John Stuart Reid, in his 4 Postulated Laws of Cymatics (the study of visible sound & vibration, where sound frequencies cause patterns to form in mediums like sand, liquids, on vibrating surfaces, revealing geometric shapes of sound waves), he explains, how they play out in the biological processes at work on our body.*

"One of the facts about Cymatics, is that all when we are immersed in an environment of sound, and of course we're always in s sound, there's never a time when we're not in sound, but let's say musical sound, then all those musical sounds are literally imprinting on every cellular membrane in our body, every cell has a membrane, and the Cymatics Principle, is that whenever you have Sound, and you have a membrane, there has to be a Cymatic Pattern invisible, to the unaided eye but nevertheless present.

> *"The holographic principle is a mathematical principle that the total information contained in a volume of space corresponds to an equal amount of information contained on the boundary of that space." - Andrew Zimmerman Jones, describes the Holographic Principle*

Every atom, and molecule in the sound, carries all of the vibrational Energy Information of the originating sound, and this fact tends to be overlooked when the wavelength of sounds in relation to human tissues is concerned.

The Sonic frequency is imparted to Atomic and Molecular particles in any Body of Water, or holographic, or let's say quasi-holographic in nature, and this brings us to the 1st Postulated Law of Cymatics. In a dynamic Cymatic pattern, in Water or other fluid media the frequency information contained in every atom or molecule is identical, and interpreting this importance of this law in terms of our Water rich biology, when Sound enters our Body, it means that every Atom and Molecule of the Sound, carries all of the Energy Information thus communicating the Sonic information to all aspects of our physiology, even down to the microscopic and submicroscopic scale.

1st Law of Cymatics: In a dynamic cymatic pattern, the frequency information contained in every atom or molecule is identical.

Interpreting the importance of this law in terms of our biology, when Sound enters our body, every atom and molecule of the sound carries all of the energy information, thus communicating the sonic data to all aspects of our physiology, even down to the microscopic, and sub microscopic scale.

2nd Law of Cymatics: A fluid membrane compresses incident sonic periodicities in a ratio governed by the relative densities of the sonic and fluid mediums.

Interpreting the importance of this law in terms of our biology, all the Sounds that enter our body from the environment, are compressed in the 829:1 ratio when they enter the Body's:

a. Interstitial Fluids
b. Fascia
c. Organs
d. Cells
e. Bones

3rd Law of Cymatics: Cymatic patterns on a circular membrane represent an encoded model of the sound since the crests the waves at the moment before Faraday instability are in phase with the crests of the initiating sound."

Interpreting this law in terms of our biology, Cyma-Glyphs are literal geometric models of a therapeutic sound, and therefore can be used as a therapeutic tool.

4th Law of Cymatics: Normal modes of vibration for a given membrane are limited in number, while 'special' modes of vibration for the same membrane are unlimited.

Interpreting this law in terms of our biology, it means that all our tissues receive a constant stream of ever-changing Cymatic Patterns when we are immersed in a musical environment." – Dr John Stuart Reid, Acoustic Physics Researcher, in "Water Conference 2024 on the Physics, Chemistry, and Biology of Water", Lisbon, Portugal, 18 October 2024.

The Medical Trade So-called "Genetic Theory of Disease", Down The Drain

This information Furthermore Confirms That:

The Medical Trade is the "De Facto", the most, Nonsensical, Farcical & Laughable Pseudoscience in existence today.

"I ended up teaching in a Medical School, and I was teaching the conventional science of genes control your life, and this is an experiment that I did, that changed my whole life.

I have 50,000 genetically identical cells in a petri dish.

All the cells came from the same parent.

I split the cells into 3 different petri dishes.

I changed the environment, and each of the dishes in environment A the cells: form Muscle.

In environment B the cells: form Bone.

In environment C the cells: form Fat Cells.

Now you're left with a question:

What controls the fate of the cells?

And the answer is not the genes, they were all exactly the same.

The only thing that was different was the environment.

When I tried to show my experiments my colleagues, they looked at it, and said it's not real.

I left the system, I knew I was teaching the wrong information that genes do not control things.

Isaac Newton didn't put God or invisible forces or Spirit, he just measured physical things, so the body being a part of a mechanical universe is a machine.

Say well, how the machine works, take it apart study the pieces.

So they were taking apart the body, they found there were cells, and then they took the cells apart, and they found that cells are made out of protein.

And the question is who makes proteins?

It was in 1944 the first study revealed that, if you took DNA from one species, and put it into a bacterial culture of a different species the bacteria culture start to resemble the bacteria where the DNA came from.

So then they say the DNA makes a protein the next question is who makes the DNA?

Well this is where science got screwed up.

DNA is a double helix, in an experiment they separated the double helix, so I have 2 single helices and they put those into a solution of building blocks and they pulled it out, and it was a double helix again.

The answer is clear DNA makes itself.

And DNA makes the proteins the end of the search.

Once they found the DNA was important they threw away the protein well they threw out the control the control was in the protein and proteins respond to environmental signals.

People say, you're studying cells in a plastic petri dish what does that have to do with me.

It doesn't make a difference to the cell if it's in a plastic dish, or a skin dish.

It still responds to environmental signals.

So the environment is controlling the cells.

But between the environment and the cells, is the mind and that does interpretation. If you open your eyes, and see someone you love, your mind interprets love, and you release beautiful chemicals, dopamine for pleasure, oxytocin for bonding.

If I take the chemicals from a brain that perceives love, and put them into a plastic petri dish, the cells grow beautifully.

If I take the chemicals, from a brain that perceives fear, the cells stop growing, and they start dying.

So, you're the one whose thoughts change the chemistry, and the chemistry controls the genetics.

So, all of a sudden you're not a victim of your genes.

You're the master of your genes." - Dr Bruce Lipton, Professor of Anatomy, in "The 1 Field", 2019.

The State of the Blood
A Major Factor In Aiding Rejuvenation of the Body
Or Establishing Disease

"Until William Harvey made his discovery on the Circulation of the Blood, the modern world was without a fundamental principle upon which to base any attempt to rejuvenate the body.

This knowledge is still so new, that Medical Trade Schools are in darkness on the subject of rejuvenation.

It is now known the blood is a vast transportation system, with many functions. It carries new material to all parts of the body to repair and renew its constantly decaying cells, and carries off for elimination their waste and excretory products.

This recently discovered knowledge proves the River of Living Water Is The Fountain of Youth, by which every part of the body, every hour of its life, is incessantly repaired, renewed, rejuvenated, from the softest cell to the hardest bone. That is Regeneration in every sense of the word.

The great Metchnikoff was jeered by his medical brethren when he answered these questions.

He declared that deterioration of bodily structure and old age are due to minute quantities of poisonous substances in the blood.

His work furnished the first logical explanation in modern times of the degenerative changes that occur in the body, and why.

His findings have been confirmed by research workers, including Dr George W. Crile, Dr James Empringham, and Dr Alexis Carrel.

> ***"There is no natural death.***
> ***All deaths from so-called natural causes are merely the end-point of a progressive acid saturation."*** *- Dr George W. Crile*

> ***"All creatures automatically poison themselves.***
> ***Not Time, but these toxic products (in the blood) produce the senile changes we call old age."*** *- Dr James Empringham*

> ***"The cell is immortal.***
> ***It is merely the fluid in which it floats that degenerates.***
> ***Renew this fluid at proper intervals, and give the cell nourishment upon which to feed, and, so far as we know, the pulsation of life may go on forever.***
> ***Quickly, involuntarily, the thought comes: Why not with man? Why not purge the body of the worn-out fluids, develop a similar technique for renewing them—and so win immortality?"*** *- Dr Alexis Carrel*

Disease is Degeneration

"Carbon-Monoxide: A concentration only two parts in ten thousand will produce the symptoms of headache, mental dullness, muscular fatigue and loss of energy in a few hours. These symptoms in city workers and city dwellers are common and usually disregarded. The victims look to foods and vitamins for relief, not knowing the cause of the trouble. Scientists of the Harvard Laboratories, risking their lives to discover more about carbon monoxide gas, found the average man can endure it only until his blood is one-third saturated. **Scientists agree that city air is a polluted mixture of industrial fumes, such as carbon monoxide, sulphuric acid, hydrochloric acid, nitric acid, hydrocyanic acid, benzene, methane, sulphur, and other dangerous chemicals too numerous to mention.**

In addition to these poisonous industrial fumes, city air is saturated with exhaust gas from motor cars and trucks.

This deadly gas consists of carbon-monoxide, carbon-dioxide, lead-oxide, lead carbonates, free gasoline, and complicated benzine chain compounds of the hydrocarbon series. These substances are deadly poisonous to man.

Only a few grains of hydrocyanic acid produces violent death quickly." - George R. Clements, in "Live Better", 1962.

> ***"Among the more dangerous compounds, nitric acid and sulphuric acid are always present in combustion gases.***
> ***It thus results that in our cities an average of 2,500,000 particles per cubic inch are present."*** *- Professor H. Landsburg, Geophysical Laboratory, Pennsylvania State college*

"The products of combustion also irritate the eyes, ears, nose, throat, the-respiratory tract, the bronchial tubes, and the Castro-intestinal areas.

In the lungs the carbon particles accumulate and become imbedded in the air cells, and in time the lungs change from natural pink to black.

I have performed many autopsies upon New Yorkers, and almost without exception their lungs were as black as night. I could present an impressive list of diseases in which the influence of polluted air is known.

It is in Pneumonia, of the acute disorders, that the influence of polluted air falls most disastrously.

Pneumonia ranks first, in the industrial U.S., in the list of Acute Diseases as a cause of death.

It takes away vigorous adults in the most useful years of their lives." - Dr Thomas Darlington, former Health Commissioner of New York City

"While a diseased heart, liver, kidney, pancreas, stomach, etc., may be regenerated to such extent that it fails to bother its owner, and may give good service for years, such organ cannot again become normal.

That fact is proven by the evidence that a wound, though it heals, yet leaves a scar composed of low grade tissue.

A fatty heart, a fibrous liver, a diseased mucous membrane — these can not return to their normal state. But as the original size of an external scar diminishes with the passage of time, so the diseased organs, by a process of strict living, will continue to improve with the passing of years.

The body, we observe, is struggling against two enemies: the physician without and his poisons within, and the original poisons within, which the body endeavoured to eliminate by accelerating its functions.

Each time that the body was making progress in its work, it received a serious shock at the hands of the physician; and each time this shock occurred, it decreased the body's vitality.

Knowing that the body is a unit, we know, **that the law which governs the whole, governs every part. When any part shows signs of sickness, such as throbbing heart, rapid respiration, rising temperature, and so on (which medical men term and treat as disease,) we should know that the whole is affected.**

More than this, we should know that the cause of the visible signs of sickness is merely the secondary effects of the body's reaction to an internal danger, the primary cause of which is violation of law; and that the reaction has for its sole purpose the purging of the body, by its cleansing forces, of the systemic poisons which constitute the dangerous element.

There is reason and purpose in every function of the body. All its functions are perfect, and are designed to accomplish specific results.

These results have for their object the improvement of the organism.

To "treat" the affected parts (the parts that exhibit the symptoms of "disease"):

Is to Ignore the Purpose of the Body to Thwart its Efforts, and to Force Upon it an Inimical Condition that it was Striving to Cast, Off.

Because we do not understand the body, or its function, or the purpose of its function, does not license any of us, not even "scientists", to assault and attack the body, or any of its parts or functions, with drugs, serums, and knives.

To do so must lead only to permanent injury.

All substances which, when introduced into the body, either by cutaneous injection or absorption, by respiration or by ingestion, cannot be utilized as food by the body economy, are poisonous thereto.

Poisons always force the body to act in self-defense.

If the kind and quantity of poison be insufficient to produce instant death, it produces death by degrees by establishing a condition of chronic poisoning (so-called immunity); a danger to which the body adjusts itself only when it cannot control nor destroy the same.

In the finale, **the destructive agent, which the body was unable to control or destroy, and to which it was forced to yield after its resisting-power was weakened, will compel the body to destroy itself by forcing it continually to act in self-defense, against the ever-present danger, until its Vital Force is exhausted, resulting in a collapse of the nervous system that ultimately brings death.**

Every rational person knows that Exhaustion Kills, even though the body be, in every particular, healthy and vigorous. 2,500 years ago, when the Greeks won the great victory of Marathon, the messenger who brought the news to Athens, ran the entire distance on foot, more than 40 kilometres, and Fell Dead From Exhaustion as he delivered his message.

The machinery of the body functioned so violently and so long, to meet the extraordinary demand made on it, that it simply Collapsed from the Exhaustive Strain.

The More Poisonous any Substance Is, the More Dangerous It Is, and the Quicker and Harder the Body Acts.

Such treatment, instead of its being curative, is destructible: for it is a terrible shock to the nervous system, and may be continued until the body will utterly collapse from the exhaustion induced by its own violent efforts of self-protection.

Every effect is visible, while every cause is invisible.

No power, force, substance, or thing is able to save the body or serve the healing power within, further than to remove the obstruction responsible for its disturbed equilibrium.

In Direct Ratio As The Blood becomes:

Stagnant, Foul, Impure, and Abnormal, will and must All Organs, Tissues, and Cells show a Decline From the Normal - THIS IS DISEASE.

1. The continuous existence of the body depends upon the blood.
2. A normal flow of normal blood brings health.
3. Retarded circulation and foul, impure blood brings disease.
4. Purification of the blood and acceleration of the circulation is scientific treatment.
5. The procedure must be natural; and, being natural, results are and must be favourable and permanent." - George R. Clements, in "Live Better", 1962.

Blood-Poisoning By The Medical Trade Drugs

"Agranulocythaenia (Blood-Poisoning), is a fatal disorder.

It is now known to be caused by Pyramidon, a drug taken and widely prescribed by "specialists," for relieving symptoms derived from elementary errors in the manner of living.

Sir William Wilcox, the eminent English Toxicologist, in the British Medical Journal 2 years ago, discloses that this disastrous disease is caused also by the Salicylates - Drugs universally taken and prescribed by medical men the world over, for the suppression of symptoms they call "Rheumatism."

But such symptoms are no more than commonplace consequences of wrong feeding and general habits - not infrequently, of unhappiness merely.

Agranulocythaenia (Blood-Poisoning) may also be caused, says Sir William, by the Barbiturates (of which **Luminal the great Brain Paralyser,** is the best known), prescribed literally in tons for suppressing nervous symptoms arising from toxic conditions of body and mind.

Also, says Sir William, by "Avertin," used as a basal anaesthetic in surgical operations for cutting out symptoms amenable often to simple natural methods.

Also by Aspirin!

Who dare compute the number of tons of this potent destroyer swallowed annually to relieve the symptoms of stupid living?

One English firm **spent £340,000, in 1 year, in advertisement alone, on 1 particular futile disease-producer.**

And the British Medical Journal continues to draw large sums from advertising, to medical men, the poisons its own columns condemn!

What Sir William Wilcox has yet to discover is, that **Agranulocythaenia is only one of the killing effects of the above named poisons.**

Presently it will dawn on him, to his horror and dismay, that:

1. Deafness.
2. Eczema.

3. Asthma.
4. Blindness.
5. Paralysis.
6. Criminal degeneracy.
7. Delusions.
8. Cancer.
9. Insanity, together with
10. Numerous Other Appalling Adversities

Quite frequently eventuate from a variety of Drugs so comprehensive as to include almost the whole range. These are reckoned already by tens of thousands; and are continually increasing in numbers, futility, and toxicity.

Not long ago, while eulogies appeared of "God's G. men," as a paper was pleased to term us medical men, **a paragraph recorded some hundreds of deaths caused by the latest drug advocated to "cure" "blood-poisoning."** Inept in their ignorance, though anxious enough to aid, **those who prescribe these compounds know practically nothing of their composition, and less of their action, immediate or remote.** Desperate in their helplessness, and beguiled by specious and cunningly worded advertisement, they clutch at the subtle deceptions as a drowning man at a straw; **they impose upon public confidence by prescribing on the say-so of salesmen carefully trained to take advantage of ignorance and credulity. Doctors thus become the agents for destroyers** more frightful than phosgene." - Dr Ulric Williams, MD, in "Hints on Healthy Living", 1939.

> ***"Systematic Studies suggest that many stories about New Medicines tend to overstate benefits, understate risks and costs, and fail to disclose relevant financial ties."***
> ***What's more, "overly rosy coverage of Drugs may also result from the direct and indirect relations between journalists and Drug Companies", that is, the financial ties between the reporters and Big Pharma with all its perks.***
> ***"Another conflict of interest for editors relates to advertising, a major source of income for many journals. Most of the advertising comes from Pharmaceutical Companies."*** *- Dr Michael Greger, MD, 19 September 2019.*

> ***"They also found that press releases about research in medical journals often presented results in exaggerated formats and failed to mention study limitations or funding sources. Overly rosy coverage of drugs may also result from the direct and indirect relations between journalists and drug companies. Some medical reporters undertake work outside their media outlets that is paid for by drug companies, some receive all-expenses-paid international trips from drug companies, and some accept generous medical-media awards sponsored by drug companies — in some cases with company representatives sitting as judges."*** *- in "Making medical journalism healthier", The Lancet, 21 June 2003.*

Medicines Are Poisonous, or Anti-Vital in their Tendency

“In cases of acute disease, the cure is much better effected without medicine than with. But especially where there is no particular disease, only a fear that there may be, **should medicine be avoided as you would avoid a serpent.**

It is poisonous in its nature, always produces evil, and seldom any good.

Taken habitually, it will cause the diseases which it is taken to prevent, or cure. We would discard them all as unnecessary, and depend entirely upon obedience to preserve health and prevent disease.

But if medical treatment is to be resorted to, it seems to us that the Water Cure is the one best adapted to the purpose, and one which produces the least evil of any. In skilful hands, it can be made to answer every purpose, and no bad effects will ever result; or, if ever, at most, very seldom.

No doubt it is destined soon to supersede the use of drugs entirely.

It is almost infinitely to be preferred.

But still it is infinitely better to prevent disease by proper regimen, than to be cured even by Hydropathy. But if a disease is to be cured, Hydropathy against the world, say we.

First; Medicines Are Poisonous, or Anti-Vital in their Tendency.

In Their Effects they are Opposed to Vital Action, and Injurious to the Vital Organism. If received into the vital economy in any quantity, and retained for any length of time, they will destroy life; but the vital organs are endowed with beautiful instincts, by which they are enabled to perceive the presence of any injurious substance. They instantly give the alarm, and the vital powers are at once aroused to energetic, and, if necessary, to convulsive efforts to expel the offending substance. This reaction, so to speak, of the vital powers, or their convulsive efforts to expel an injurious substance from the vital economy, is often so violent as to cause death, even before the direct and proper effects of the poison are hardly perceptible. Now, it is evident that in this energetic and convulsive action of the vital powers, foreign and morbid matter, which was before in the system, producing derangement and disease, might be expelled along with the poison which produced the paroxysm. For instance, suppose the stomach to be loaded with morbid matter which it cannot get rid of, and which obstructs its action, if we take a proper quantity of a substance which will produce a violent reaction in the stomach to expel it, it is evident that the morbid matter may be expelled along with the poison. In this case the medicine, by its direct effect, has produced no cure; but has only removed an obstruction which interfered with the function of an organ, and thus permitted the organ, by its own inherent energies, to remove normal action, and restore the injury previously done. In fact, **the drug being anti-vital in its tendency** (for by this property only did it produce the spasmodic effort), **by means of the violent and unnatural action which it produced in the stomach, has still further weakened and injured that organ, so that it has produced injury rather than benefit.**

However, the morbid matter is removed, and it is frequently worth while to submit to the inevitable evil for the sake of the incidental benefit.

The vital energies may now go to work, and repair, as far as possible, the injury done. Nature is economical of means of expenditure. If the presence of a poisonous or anti-vital substance will not immediately and seriously endanger the welfare of the system, or if it can be removed by means of the natural excretory organs, the vital instincts will not risk the danger and injury of a violent spasmodic effort like vomiting, but the offending cause will pass along, and perhaps be expelled by an instinctive and energetic effort of the bowels.

In purging, the muscular action of the bowels is increased, and also the liquid secretion, in order to dilute and flood away the offending substance, and protect the delicate tissues; but in this operation, any morbid matter which happened to be present would be removed as well as the poison; not only so, but the liquid secretion of the bowels, which was instinctively increased by the means and for the purpose above mentioned, is a natural and constant and important excretion for the removal of waste, and effete, and any foreign matter from the body. If this excretion has been suppressed, and the body become loaded with foreign or morbid matter, which causes disease, then, when it is increased by the action of the drug in the way above mentioned, **this matter would be of course removed, and the system enabled to restore itself.**

In this case there has been no direct benefit produced by the medicine, but on the contrary, the vital energies have been weakened, and the organs injured, by the violent instinctive efforts which they have made to protect themselves.

All the benefit produced is the removal of the morbid matter, so that the system is now at liberty to recover itself by its own powers.

In the same way other anti-vital substances will stimulate the functions of other excretory organs to protect themselves, and remove the poison from the system, and in this way will tend to purify the body, and allow it to regain health by its own recuperative energies; but this process inevitably produces evil, and is only to be tolerated in certain cases for the incidental benefits which occur.

They waste vitality, or the fund of life, weaken the organs, tend to deprave the functions and destroy the natural instincts which warn against danger, and are followed by reaction and torpor of the stimulated functions, which, as a general thing, more than counterbalance any benefit which can possibly be produced.

The more such stimulation is resorted to the less able the organs become to perform their material functions without it. No greater physical calamity can happen to a human being than the production of such a necessity, and the continuation of such a habit of constant drugging. The effects produced are, as we have seen, simply the vital reaction against a poison, or the instinctive efforts of the system to protect and free itself from a drug which would otherwise greatly injure or destroy it. The purpose above mentioned, is a natural and constant and important excretion for the removal of waste, and effete, and any foreign matter from the body." - in "The Organic Laws; Or, the Laws which Govern the Human Organism", 1851.

Blood Red Cells Conquer Pain

"Recently **Red Cells obtained from blood collected at Blood Banks have been used in a new and Remarkably Effective way to Cure Ulcers, Infected Wounds and Bums. The response is prompt. Pain almost immediately disappears.**

Purulent ooze subsides under the protective film. Granulation tissue rapidly develops.

All this means a forward step in the collection and utilization of blood for "banks" now considered indispensable for transfusion both on the battlefield and in civilian life. **Hitherto hospitals and Red Cross stations where blood banks are built up have thrown the Red Cells away.**

Only the plasma is wanted; the amber-colored liquid in which the cells are carried. More than half the blood collected is therefore wasted.

Now that the **Red Cells can be used with astonishing benefits in treating bums, wounds, ulcers and sores**, blood banks are able to do double duty.

The Red Cells brought about Healing where other modes of treatment had failed.

Not only infected or uninfected bums and wounds, some ulcers but even some types of osteomyelitis of the carpus (inflammation of bone-marrow in the wrist) have been beneficially treated with Red Cells." - in "Blood Cells Conquer Pain", Science Digest, May 1943.

Toxaemic Conditions Bring About Destruction of Leucocytes

"A microscopic examination of fresh normal human blood reveals the fact that it consists of a colourless fluid part, the blood-plasma, in which are suspended enormous numbers of non-nucleated circular biconcave discs, the Red Blood Corpuscles or Erythrocytes, and a much smaller number of nucleated more or less amoeboid cells, the White Blood Corpuscles or Leucocytes (white blood cells).

The much smaller blood platelets are usually indiscernible by this method of examination.

In health, whilst the erythrocytes are all uniform in character and appearance, the leucocytes, on the other hand, show many differences among themselves.

Thus they vary in size, in the size and shape of the nucleus, and in the amount and appearance of the cytoplasm, which may be hyaline or finely or coarsely granular.

Hence several varieties can readily be distinguished and recognised.

It is, however, chiefly upon stained preparations of blood films that we rely for the recognition and accurate differentiation of the various kinds of leucocytes.

Normal Human Blood contains the following varieties of leucocyte, together with the percentages they form of the total number of leucocytes:

1. Lymphocytes, large and small (22%).
2. Polymorphonuclear neutrophilous leucocytes (70%).
3. Large hyaline mononuclear leucocytes (4%).
4. Transitional leucocytes (1%).
5. Eosinophilous leucocytes (2.5%).
6. Basophilous leucocytes or “mast-cells” (0.5%).

In certain pathological states there may be an increase or decrease, relative or absolute, of any or all of these varieties of leucocyte, whilst **the blood may also contain abnormal forms of white cells constituting the various types of myelocyer developed from the bone marrow.**

These 2 varieties are the polymorphonuclear neutrophilous leucocyte, and the large hyaline mononuclear leucocyte respectively.

Polymorphonuclear Neutrophilous Leucocytes

Of the various types of leucocyte present in normal human blood, the polymorphonuclear neutrophilous leucocyte is the most abundant.

From 70% to 75%, of all the leucocytes are of this variety. In the various leucocytoses this number is greatly increased, reaching 90%, or upwards.

It is an actively phagocytic body, and on this account was termed “microphage” by Metchnikoff. By the production of a ferment-like body “microcytase”, it digests and destroys bacteria and other substances which have been phacocytosed.

A sufficiently accurate and comprehensive differential polymorphonuclear blood picture may be obtained by classifying these cells according merely to the number of the definite segments of the nucleus without reference to their shape, size, or arrangement.

This method gives 5 classes as follows:

Class I comprises cells with unipartite or undivided nucleus.
Class II cells with bipartite nucleus having 2 segments.
Class III with tripartite nucleus, having 3 segments.
Class IV with quadripartite nucleus, having 4 segments.
Class V with multipartite nucleus, having 5 or more segments.

In health and under normal conditions, segmental neutrophile blood picture is remarkably constant.

In pathological conditions, on the other hand, especially when associated with Toxaemia, this relationship is altered, the amount of alteration being proportional to the Toxaemia present.

This alteration consists in a diminution of the more segmented forms, so that a relative increase of Classes I and II results. This condition Arneth speaks of as “laevo-deviation”, (a turning or deviation to the left), or “dislocation to the left.”

This laevo-deviation in various diseases is readily seen.

> ***"Depending on the degree of Infection or Intoxication, according to the specific effect of the Infecting or Intoxicating agent on blood and marrow, depending on the Nutritional Status, and Resistance of the individual, depending on the presence and transfer of the infectious agents enter the blood or not, depending on the process of any local disease process that may have occurred and its consequences and probably still to come a wide range of all sorts of other factors an infinite series of manifolds and processes, the most prominent of which we have so far identified as hyperleukocytosis and normo[leuko]cytosis, and to single out hypo[leuko]cytosis in particular were used to."*** *- Dr J. Arneth, MD, "Die neutrophilen Leukozyten bei Infektionskrankheiten", Deutsche Med. Wochenschr, 7 January 1904.*

It is in connection with Pulmonary Tuberculosis that I have specially observed this condition, in a series of cases of Pulmonary Tuberculosis, in collaboration with Dr Horace Wilson, I have investigated the condition of the Leucocytes after Arneth's method, very interesting results were obtained. **Arneth considers that Toxaemias bring about the destruction of neutrophile leucocytes, the disintegration affecting particularly the older cells, so that forms possessing the most divided nucleus disappear first from the blood. Hence the neutrophile blood picture may be taken, as An Index of the Severity of the Intoxication.**

That Toxic Substances circulating in the blood actually do bring about the destruction of the neutrophile leucocytes, is proved by examination of the blood in cases of poisoning by Tri-nitro-toluol and allied substances.

Cases of Tri-nitro-toluol poisoning occurred not infrequently in certain classes of munition workers during the Great War, especially among "T.N.T. Fillers." (Trinitrotoluene, is an explosive chemical compound).

In one fatal case in which I made a differential leucocyte count shortly before death, the destruction of the polymorphonuclears was carried to such an extreme degree that none of the well-known varieties of leucocyte could be detected, such leucocytes as were present consisting entirely of badly staining degenerate-looking cells, somewhat resembling abnormal lymphocytes.

This condition of the leucocytes produced a striking picture of the histological appearances of the blood — a peculiarity which I have never encountered in any other condition. These findings are quoted to support Arneth's views that **Toxaemic Conditions Bring About Destruction of the Polymorphonuclear Leucocytes,** but the destructive process had here been carried to such a degree that all the 5 varieties had disappeared alike.It has long been known that an increase in the total number of leucocytes in the blood occurs in the condition known as leucocytosis, and that most commonly this leucocytosis is due to an increase in the number of polymorphonuclears present, the number of the other varieties remaining unchanged.

An increase in the relative percentage of polymorphonuclears thus results.

This total increase in the number of leucocytes, together with an increased relative percentage of polymorphonuclears, **is met with in every sort of Acute Inflammatory Process.**

Thus **in Acute Septic Infections, in Pneumonia, in Erysipelas, in Endocarditis, etc., the Leucocyte Count May Rise to 60,000 per c.mm., or even more, the polymorphonuclears giving a relative percentage of 90% to 95%.**

Certain chemical substances like nucleic acid and yeast also produce a polymorphonuclear leucocytosis, and this fact has been made use of therapeutically where an increase in the number of these cells seemed desirable.

An increase in the amount of phagocytosis can thus be secured, and by obtaining increased phagocytosis, increased destruction of micro-organisms can be brought about. Not only may increased phagocytosis be procured by increasing the number of phagocytic leucocytes, but also by increasing the opsonic content of the body fluids, and by increasing the phagocytic activity of the leucocytes themselves.

Large Hyaline Mononuclear Leucocytes

These are the largest cells present in normal blood, being about 2 or 3 times the diameter of the red blood corpuscle. In them **the Cytoplasm is relatively more abundant than in the Lymphocytes.**" - in "Some Factors in the life history of the Leucocyte", Science Progress, 1923.

> ***"The Leucocytes are able to absorb, not only living bacteria, but soluble substances as well."*** *- in "White Blood Cells in Disease", New York Medical Journal, 24 November 1900.*

The Alkalinity of the Blood
And the Number of the Leucocytes

"Loewit (Allgem. Patholog. des Fiebers, Jena 1896), reports that **in the first stages of artificially produced infectious diseases, he found a considerable rise in the Alkalinity of the Blood:**

> ***"In the experiments reported the increase in the Alkalinity of the Blood appears as a Forerunner of the subsequent decrease, which is in accordance with the views expressed by Loewy and Richter. Here the idea certainly seems to suggest itself that in the increase in the Alkalinity we Have a Protective Measure or counter-reaction of the Diseased Organism Against the Cause of the Disease and its Effects."***

Later on, Loewit, in an experimental study (Zeigler's Beitrfige, 1897), enters into the question of **the relations between the amount of the Leucocytes, and the degree of the Alkalinity.**

He endeavoured to produce in the blood a change in the leucocytes without a previous Infection or Intoxication, which on its own account may affect the Alkalinity.

As Loewy and Richter emphasise, a connection is experimentally demonstrated between **the number of the Leucocytes and the degree of Alkalinity.**

That **there exists a connection between the Alkalinity of the Blood, and the number of the Leucocytes** appears to be established by the investigations of Loewit and Loewy and Richter.

Loewit further confirms **the relation between the Alkalinity of the Blood and its Protective Power.**

Hence it appears that, **so long as the number of Leucocytes in the blood is still somewhere about a thousand, its bactericidal strength is practically unchanged.**

Only when it falls below this already minimum value, is its strength impaired or entirely suspended.

A much-debated statement made by Virchow more than 50 years ago has been amply confirmed.

He said:

> ***"Claim for the white blood-corpuscles a place in pathology."*** *- Rudolf Virchow*

And Prof. Minkowski (Ueber Leukamie u. Leukocytose, XVII, Kongr. f. inn. Med., 1899, p.184), very properly adds:

> ***"And for Therapeutics."*** *- Prof. Minkowski*

As regards the articles of Profs. Loewy, Richter, and Dr Jacob ("Zeitschrift fuer Khnische Medicin", 1896), **on the influence of the different degrees and stages of the alterations of the leucocytes during the course of the infection in the animal body** we would refer to the original, and to the discussion of this subject by Prof. Poehl in his "Spermin Theory", p.107-117." - in "Rational Organotherapy", 1906.

Emotions Affect White Blood Cells

"Athletes waiting for the game to begin become tense and "wrought up", and this **Emotional State Is Accompanied by a Marked Change In The Makeup of the Blood,** Dr Edmond J. Farris, Wistar Institute of Anatomy and Biology, stated before the meeting of the American Association of Anatomists.

Most notable change, I**s A Great increase in the White Blood Cells: Lymphocytes.** Athletes who gave samples of their blood while they were waiting to go on the field **showed increases ranging from 39.2% to 59.8% in the Lymphocyte count."** - in "Science Digest", June 1942.

The Discovery of Red Blood Cells Acting as Micro-Electrodes

*"In the Scientific Report **"Vm-related extracellular potentials observed in red blood cells"**, 30 September 2021, academics at the University of Surrey **have discovered that Biological Cells generate an Electric Field Voltage** that appears outside and not just within, meaning each cell acts as a tiny electrode. Since this voltage impacts how cells interact with their environment, including the way cells stick to one another. **Through intricate experiments with red blood cells, the research team has shown that the voltage appears outside the cell as well. This means that cells effectively act as tiny transmitters, electrically changing the environment around them.** Cell-scale science is an essential area of study. **By reintroducing the Electrical Element, we are looking for, and finding, a whole new way to understand how the body work. Since the 1790s, scientists have known that electricity plays a role in the function of life, with the discovery in the 1940s that every cell contains a voltage that controls many of its functions. This is particularly the case in muscle and nerve cells but has also been shown to play an important role in diseases such as cancer."** - in **"The discovery of red blood cells acting as micro-electrodes"**, University of Surrey, 6 October 2021.*

The Electro-Magnetic Aspects of Red Blood Cells

*The following articles on the Electro-Magnectic Aspects of Red Blood Cells, include the work of hundreds of Scientists and Health Practitioners on Biophotonics and Biophotonic Therapy; the view of Russian researchers that, by a process of elimination, the Red Blood Cells form the dermal-optic photoreceptor; comments by a Russian Scientist that **the effectiveness of Biophotonic Therapy Against Infections Is Too Great** to be by chance; that it must be some early form of immunity; and comments by Professor Vladimir L. Voeikov, Moscow State University, that **the Red Blood Cells are ultrasensitive to electromagnetic stimuli and that in real time the whole blood forms a well-ordered system. All living cells emit extremely faint light called "Biophotons", they where discovered by Dr Alexander Gurwitch, and where named by Dr Fritz Albert Popp. Biophotons are believed to regulate growth and cell communication.***

"Acting in a coherent fashion, Red Blood Cells play a much more important role in life processes.

Red Blood Cells unique, remarkable role in Oxygen, and carbon dioxide transport sharply distinguishes them from the body's other cells.

So do their anaerobic energy metabolism, peculiar biconcave shape, 120 day life cycle (with 2,000,000 new Red Blood Cells formed every second), iron content, and extremely high hemoglobin content (roughly 270 million hemoglobin molecules are packed into each one of 25 trillion Red Blood Cells).

While their counterparts in many vertebrates and invertebrates retain the nuclei and organelles that mammalian Red Blood Cells (RBCs) eject in the course of maturation, the erythrocyte group in general exhibits certain "prokaryotoid" characteristics, including an ultrasensitivity to electromagnetic forces.

Hemoglobin contains the same porphyrin ring as chlorophyll, though the ring in chlorophyll is coordinated by a Magnesium Atom instead of an iron one.

Given chlorophyll's role as the light-processing molecule of plants, hemoglobin thus may be especially well equipped to absorb and process light.

The coordinated group response of the whole blood to threats and the Red Blood Cells apparent participation in the "communications phenomenon" whereby cells signal to each other add to the picture of Red Blood Cells as conserved, "prokaryotoid" or more exactly "metakaryotic": they have moved beyond containing nuclei.

Neural Cells, primarily neurons and glial cells, form the nervous system, with neurons transmitting information via electrical signals and glia providing essential support, structure, and nutrients, enabling functions from thought and movement to sensation, all coordinated by the brain, spinal cord, and nerves.

Neurons have a cell body, dendrites to receive signals, and an axon to send them, communicating across tiny gaps called synapses.

The discovery that Neural Cells, can be retrained to become Red Blood Cells suggests that one should think not of different "kinds" of cells but rather of different "states" of cells, so the Red Blood Cells can be considered as being in a metakaryotic state (distinct type of stem cell found in humans and other organisms that differs significantly from conventional eukaryotic cells in how they divide). They differ from other body cells in lesser ways as well; For instance, Red Blood Cells are the only cells that do not produce eicosanoids–prostaglandins, and leukotrienes.

Magnetoreception In Animal Navigation

Over the past 150 years, hundreds of scientists have collected and sifted through evidence on the role of Magnetoreception in animal navigation in creatures ranging from tiny microbes to human beings. While it has been possible to demonstrate that responsiveness to magnetic fields, primarily the geomagnetic field, is found in scores of species, critical, perplexing questions remain.

Various researchers have identified **magnetite and other biomineralized crystal deposits in a range of locations in the bodies of animals, including the well-known deposits in the front of human skulls.**

However, the ultrafineness of magnetoreception, reaching into the low nanotesla region, suggests that "such sensitivities can only be achieved by averaging the responses of large numbers of magnetite-based magnetoreceptors."

But magnetite crystals are generally not found in large numbers, and the presumed exceedingly sensitive and computationally powerful magnetoanalyzer must be something other than the crystals themselves.

Similarly, a leading researcher on the question of Human Magnetoreception concluded on the basis of extensive experimentation in humans states that:

> *"**The first discovery of magnetic material in primate tissue was by Kirschvink** (1981a). The cerebellum, midbrain, and corpus callosum, but not the cerebral cortex, of the brain of rhesus monkeys, Macaca mulatta, were found to have a diffuse saturation isothermal remanent magnetization (sIRM) of about 25 pT, suggesting the presence of between 1 and 5 million single-domain crystals per gram of tissue. Kirschvink (1981b) has also examined human adrenal glands for magnetic remanence. He found a measurable amount of high-coercivity ferromagnetic material which appeared to be finely disseminated throughout the tissue. Between 1 and 10 million single-domain magnetite crystals per gram of tissue would be necessary to account for the observed magnetic remanence. Histological as well as magneto metric techniques have been used to search for magnetic deposits in the human head. Details of the techniques used are in Baker et a1. (1983). Magnetometric measurements on "soft" tissues from the human head revealed no areas of significant magnetic remanence (Le., no readings greater than twice background noise level where background includes the sIRM of the plastic container holding the tissue). Specimens of skull, rib, and sphenoid bone also gave readings less than twice background levels. In the thin but very hard bones that form the walls of the sphenoid/ethmoid sinus complex, however, magnetic remanence was obtained that was consistently greater than twice background. **A unique feature of the study of humans in the general search for animal magnetoreceptors is the combination of behavioral. magnetometric, and anatomical evidence.** Studies of the dowsing response and of orientation in chair and bus experiments all implicate a magnetoreceptor in the front of the head in a region that has elevated magnetic remanence and appears to contain ferric material. The hypothesis that the sinus region is the site of magnetoreception involved in compass and goal orientation by humans awaits testing by micromanipulation of magnetic fields in localized regions of the head during chair and bus experiments. Until then, encouragement comes primarily from the approximate coincidence of this region with that implicated by experiments on compass and goal orientation and, for that matter, dowsing. Other features of the results from chair and bus experiments could also be interpreted in terms of the alignment and realignment of magnetic particles. The improvement in goal orientation while exposed to an artificial magnetic field and the "aftereffect", the influence of a magnet on orientation persisting even after the magnet is removed (Baker, 1984a,b, 1985), are both compatible with the alignment and realignment of magnetic particles. Even the apparent relationship between magnetic storm activity before an experiment and the performance of humans*

(and pigeons) could conceivably be interpreted in terms of the influence of the magnetic storms on the net alignment of magnetic particles. Most, if not all, results from bus and chair experiments seem compatible with a magnetoreceptor based on particles subject to alignment and realignment, either by natural events or by experimental manipulation. The exciting challenge we now face is to produce an internally consistent model that allows the influence on orientation of specific manipulations of particle alignment to be predicted in advance. When we are able to obtain predictable and replicable effects from experiments based on such a model, we may feel that we are at last nearing an understanding of one of the most contentious of biological enigmas.

Summary

The physiological responses of primates to changes in the ambient magnetic field have been studied using monkeys and humans. Magnetic storms and strong, artificial magnetic fields have both been claimed to have an adverse influence on primate physiology. On the other hand, ***when applied to fractured bones, artificial but weak electromagnetic fields have been claimed to aid repair.*** *Few of these physiological responses, however, obviously involve magnetoreception. Studies of the latter have been restricted to humans and have used 3 types of behavioral response: the dowsing reflex; compass orientation; and goal orientation. All 3 series of experiments implicate a magnetoreceptor in the front half of the head, perhaps behind but roughly level with the eyes, while* ***studies of the dowsing response also implicate magnetoreceptors in the region of the adrenal glands. Magnetometric and histological studies of human tissue have found that the adrenal glands and bones from the sphenoid/ethmoid sinus complex are both regions of elevated magnetic remanence,*** *and seem to contain ferric deposits. Studies of compass and goal orientation suggest that ambient magnetic fields can physically alter the magnetoreceptor in a manner that could be consistent with the alignment and realignment of magnetic particles. Such realignment seems sometimes to improve rather than disrupt orientation.*

Acknowledgements

Professor Yates, Dr M. I. Wright, and the staff of the Pathology Department of Manchester University provided human tissue for magnetometric and histological studies and Dr P. Dagley and the Geophysics Department, University of Liverpool, allowed the use of their magnetometer. The geomagnetism unit of the IGS, Edinburgh, provided indices of magnetic storm activity. My own bus experiments have been carried out in collaboration with Dr S. E. R. Bailey (1979), Dr. J. G. Mather (1979-1982), and R. G. Murphy (1982) at Manchester, Professor J. L. Gould (1981) at Princeton, and Professor K.

> *Adler (1981) at Cornell. R. G. Murphy carried out the exhausting series of chair experiments on Manchester schoolchildren, and nearly 100 friends, family, and students have been experimenters in other chair experiments. Dr P. Semm, Dr J. Ratcliffe, Professor J. Kirschvink, and S. Hemmings provided valuable references. To all of these and the 1,000 or so people who have been subjects, I offer my sincere thanks." - Dr R. Robin Baker, Biologist, University of Manchester, in "Magnetoreception by Man and Other Primates", Magnetite Biomineralization and Magnetoreception in Organisms: A New Biomagnetism, 1996.*

Researchers have found that migratory birds, and homing pigeons display changes in orientation after a magnetic pulse.

The researchers show how a cluster of crystals can carry stable magnetic resonance in macrostructures (chains), only to return to the crystals' usual state after 1-10 days.

This phenomenon is not consistent with an entirely free-flowing magnetoreceptor. A second candidate is the flavoprotein cryptochrome, which in some animals senses geomagnetic fields via light-dependent chemical reactions.

Human retinas contain a significant amount of cryptochrome, though this human cryptochrome has thus far been shown to act as a magnetoreceptor only when transferred to Drosophila. At any rate, hypothesizing that the red blood cells, and their hemolymphatic counterparts form the central animal magnetoreceptor and magnetoanalyzer yields a more satisfying result.

Red blood cells and their hemolymphatic counterparts fit 4 of the criteria ("questions") in a review of the hunt for the animal "magnetoreceptor" much better than do the magnetoreceptors currently under consideration.

They match 14 other points to be found in the literature as well (=18), and their role can be plausibly reconciled with the evidence that human beings possess a weak sense of magnetic orientation.

The 18 points regarding the magnetoreceptor that the Red Blood Cells fit:

1. Red Blood Cells are extremely sensitive to electromagnetic forces, which makes them a prima facie candidate.
2. Their ability to absorb and process light provides a means for transmitting and integrating light and magnetic information.
3. Red Blood Cells or hemolymphatic cells are present throughout the bodies of animals, thus accounting for the "sightings" of the magnetoreceptor in many locations, including in the eyes.
4. Because they are ubiquitous, the Red Blood Cells are the cells that transmit the information collected to the pineal and perhaps elsewhere in the brain via electromagnetic forces.
5. Their electromagnetic signaling is potentially highly nuanced, thus permitting the detailed magnetic mapping identified in honeybees and birds.

6. These blood or hemolymphatic cells are present in a very wide range of species and thus could account for many instances of magnetic navigation, though probably not for its presence in certain bacteria nor, perhaps, for special circumstances in which significant innervated biomineralization has developed. It would be possible to extend the argument to contend that the sensitivity to luminescence of the Red Blood Cells and hemolymphatic cells derived in the distant past from the original chemiluminescence of bacteria. Also, in one instance of innervation (in the snouts of juvenile trout), the fine process of the nerve was reported to be wrapped around an artery in the vicinity of magnetite crystals, which suggests a possible role for the blood cells even in these circumstances.

7. In blood cells with high iron content, the iron might respond to magnetic fields, while in hemolymphatic cells with high copper content, the electroconductivity of copper might play a role.

8. A fluid magnetoreceptor can be reconciled more readily than static ones with the requirement for adjusting to occasional reversals of the earth's magnetic poles.

9. A circulating fluid magnetoreceptor operating in nanosecond time more readily matches the requirement for dynamic turnover suggested by extensive human data collected by one researcher.

10. The Red Blood Cells intercommunication is plausible as a kind of distributed computer network that could handle the very high real-time requirements of the magnetoanalyzer.

11. There is evidence from newts that the magnetoreceptor and the photoreceptor are identical, which would fit the Red Blood Cells since they have high capacity for photoreception (see below).

12. Yet the Red Blood Cells can collect and transmit magnetic information in the absence of light, which would explain how sea turtles and other creatures can navigate in the dark. They can also respond to light in the absence of a magnetic field.

13.The animal magnetoreceptor can serve as a polarity or inclinational compass or both, which the Red Blood Cells can do.

14. The RBCs can serve as a locus of referral for both genetically encoded (innate) and memorized directional information.

15. The magnetoreceptor can adapt its functional range to new intensities following exposure to them over several days, which the Red Blood Cells can presumably accomplish according to the theory laid out below.

16. "Demagnetizing" an animal does not change behavior, which fits the Red Blood Cells better than any biomineralized particles.

17. For fine mapping, there must be many such detectors present, as with the Red Blood Cells.

18. The optimal solution for the problem of the transport of the magnetoreceptor's data to the magnetoanalyzer is that they are one and the same, as is the case with the Red Blood Cells, according to the theory propounded below.

The abundant evidence of excellent navigational abilities among seafarers and hunters, may show that human beings retain a significant latent capacity for magnetoreception, though the presence of other factors aiding navigation (odors, sunlight, stars) tends to undermine this conclusion.

Also, as with dermal optics, it may be that a small minority of people are sensitive to magnetic fields; and it is possible that they are the same ones who perform well at dermal optics. At any rate, it seems reasonable to think that the Red Blood Cells or their hemolymphatic counterparts and predecessors are the animal magnetoreceptor and magnetoanalyzer.

Dermal Optics

In the brain, the glial cells, of which the roughly star-shaped astrocytes form the main type, have traditionally been viewed as the glue that provides a scaffolding for the main players; the neurons. But gliobiologists argue that the astrocytes are active co-equals of the neurons. Employing synchronized intercellular oscillatory calcium waves via gap junctions, neurotransmitters, cytokines, and other signaling processes, astrocytes appear to provide the network of connectivity that would permit the integration required for consciousness.

Certainly the increasing astrocyte-to-neuron ratio in the brains of the “higher” mammals and above all in humans (10:1) would appear to match the requirement for greater mental capacity. Astrocytes connect to blood vessels via endfeet, and they attach to synapses via other extended processes, putting them in an ideal position to “listen and talk” to synapses.

It appears that the astrocyte endfeet serve as switches to control and integrate information flowing from neurons and the Red Blood Cells into consciousness.

According to this hypothesis, the astrocytes play the filtering role that Henri Bergson first ascribed to the brain.

This hypothesis offers an answer to a well-known riddle of neuroscience.

Since the 16th century, it has been reported on many occasions that some or all human beings possess the capacity to see through various places in their skin. Of obvious interest to blind people, this “dermal optics” was studied most intensively in Sverdlovsk (Yekaterinburg) during Soviet times.

Red Blood Cells are known to absorb light passing through the skin. By a process of elimination, Soviet scientists concluded that they are the photoreceptor in dermal optics, as they largely are in Biophotonic Therapy.

The Red Blood Cells, it seems, collect light and magnetic information, integrate it in real time, and “report” it to the pineal and other parts of the brain in some hard-to-discern manner. Dermal optics, Red Blood Cells, and astrocyte filtering can neatly explain the phenomenon of blindsight whereby people can detect stimuli even in fields for which their visual cortex neurons have been destroyed, for instance. Red Blood Cells are especially well-positioned to collect environmental electromagnetic data when they pass through the eyes because the ocular blood vessels are so close to the surface, which is optimized for sight anyway; though blood vessels are not found in the lens. Various kinds of hyperacuity that are too fine to be readily explained by the capabilities of known sensory cells may be attributable to the ultrasensitivity of the Red Blood Cells.

This role of the Red Blood Cells in the eyes runs counter to the argument that the maze of capillaries through which light must penetrate before it reaches the neuron endings of the retina represents an instance of poor design by evolution (i.e., by Nature). In fact, Nature/evolution excellently designed the eye to assure that both systems of sight; Red Blood Cells and Neurons (via the optic nerve), get a good look at the world.

The Conscious Awareness Cells

Meanwhile, the presumed capacity of the Red Blood Cells to integrate and synchronize data provides a far more satisfactory solution to the centrally important "binding problem" of real-time integration of sensory and cognitive data, such as from vision and sound, from different parts of the brain than does the hard-wired neural network, which is severely hobbled by the temporal and spatial distribution of its actions.

The binding problem is one way of stating the more general question of the conscious awareness system, or cellular basis of consciousness, which has been considered by some to be the single most important unresolved problem in the life sciences.

Consciousness is, according to this line of thinking, not localized in the neurons or astrocytes; rather, it is generated via a dynamic, interactive process in which the RBCs "read" the information from the neurons and astrocytes, then combine it with their own information to make sense of it.

This formulation does not seek to rule out the numinous or transcendent properties of consciousness, but rather to connect them to knowable capabilities of the astrocytes and Red Blood Cells.

Considering the Red Blood Cells as the consciousness cells or conscious awareness cells endows them with a role separate from the brain systems for perception, cognition, and action.

This view accords with the views of dualists, who have argued for centuries that there must be a soul that connects somehow with the physical brain yet operates according to distinctive principles. Yet it also accords with the views of monists or materialists, who have insisted that consciousness must be somehow located in the body, and so have sought the cellular location of it there.

In other words, for a long time many knowledgeable people have understood that there must be something with the properties of binding sensory data and making sense of it in real time; and the argument here is that the red blood cells are that "something".

The intertwining of the nervous system and the blood throughout the body permits them to monitor each other and coordinate their activities at every step.

The finding that one nostril can learn from the other may be mediated not through the brain but via Red Blood Cells.

Biophotonic Red Blood Cells signaling may play a role in chronobiology and hormone-like cellular activation.

In similar fashion, the Red Blood Cells could form the “third brain region” that connects the hippocampus and neocortex, mediating the firing of short bursts of electricity in each that permits memory to be replayed, reassessed, and presumably stored long-term during sleep; in rats, at any rate.

To the commonsensical objection that the constant motion of the Red Blood Cells through the brain would preclude them from developing a fix on what is taking place in the neurons and astrocytes, the answer is that biophotonics operates in nanosecond time, i.e., in real time.

At any instant the Red Blood Cells, neurons, and astrocytes are frozen in place in relation to each other, permitting precise, seamlessly updated monitoring and signal exchange.

The common image of the blood derives from films or photographs of blood cells tumbling through arteries. However, at any one time the majority of blood cells are located in the venous part of the vascular system where the flow is slower.

In the capillaries, the blood cells positively dawdle.

On average it takes more than 10 seconds for a blood cell to travel one centimeter in the capillaries.

Therefore, the motion of the red blood cells represents less of a bar to their capability to collect electromagnetic information in real time than might commonly be supposed.

Given the very steady supply of blood to the brain regardless of the body’s state of activity, the emergent property is of a very stable system of hundreds of billions of tiny oculi monitoring their surroundings. If problems arise, they are not in terms of the motion of the Red Blood Cells but rather derive from deficits in their quality or quantity (anemia), and thus in Oxygen supply and mentation.

The flow of blood to parts of the brain involved in thought or other activity, as used for functional Magnetic Resonance Imaging, has traditionally been taken to be for the purpose of supplying Oxygen to the activated neurons.

But one study found that “the heightened neural activity uses only a very small amount of this extra Oxygen.” There is evidence, too, that neural activity associated with signal inputs burns glucose without Oxygen.

This explanation leaves unanswered the question of why oxygen-laden red blood cells rush to the scene of the neural activity.

That the Red Blood Cells should rapidly move to an activated area yet retain their Oxygen: they visit the scene to view it and analyze it.

This same pattern seems to hold for the vascular surge of Red Blood Cells into the entire brain during Rapid Eye Movement sleep/dreaming.

This view of the mind suggests that certain psychological phenomena such as subliminal perception and preconscious processing may actually go on, at least in part, in the red blood cells; or perhaps in a biofield that they generate. So, too, various operations tentatively ascribed to the more primitive parts of the brain may in fact be carried out by the Red Blood Cells.

One can speak of a Cognitive Triad of neurons, astrocytes, and Red Blood Cells that can extend itself into new areas of the brain in learning situations.

Of the three, Red Blood Cells are everywhere in the brain, unlike neurons, astrocytes, or any other cell except white blood cells. While the neurons retain their importance in the sensory and motor systems, the central role of the astrocytes in this formulation fully accords with the findings of various researchers.

The Red Blood Cell Metacolony

This understanding of the red blood cells parallels the theory of the symbiotic origin of initially prokaryotic mitochondria and chloroplasts in eukaryotic cells first enunciated by a 19th century Russian biologist, and more recently developed by Lynn Margulis. It also meshes with the concept that the colonial state is the overwhelming norm for bacteria; again first championed by a 19th century Russian biologist, yet only much later accepted by microbiologists in general.

Certain close-up phenomena currently considered part of parapsychology (e.g., dermal optics) or folklore can readily be explained in simple, mundane terms by reference to the biophysics of the red blood cells and their metakaryotic nature.

How the Red Blood Cells might perform in long-range psi phenomena or across time remains an open question. The Red Blood Cells metacolony must, at any rate, be considered the leading candidate for the role of the ultrasensitive psi organ.

According to this formulation, the Red Blood Cells metacolony exercises the same extraordinary sensitivity and analytical power whether it is "reading" brain cells, conducting immunosurveillance, detecting and analyzing an object on the skin, sensing the geomagnetic field, sensing gravity, or engaging in psi activity.

One implication is that psi is a "bacterioid" phenomenon, which would certainly accord with its quirky nature. It is inherently plausible (though hardly preordained) that all cognitive functions on the continuum between logical thought and psychic intuition or messaging should be a product of a single set of cells; that any such set should incorporate capabilities for both reception and analysis; and that this set should be more "primitive" and all-encompassing than the highly articulated neuronal system that developed rather late in the evolution of the species. That the solution of the binding problem should have an evolutionary explanation that links neurons and astrocytes to a pre-existing mechanism of consciousness; a "brain behind the brain", accords with both logic and common sense.

We can draw up a list of the characteristics of what a broad view of the cellular basis of consciousness might include that the Red Blood Cells match, if they are considered as a metacolony of the sort discussed above:

1. Red Blood Cells are in continuous, intimate contact with every part of the brain in a manner that no type of neuron, glial cell, immune cell, or structural cell is.

2. They are also found throughout the body, thus providing a form of distributed intelligence, which seems appropriate for the organism's integral functioning.
3. They are ultrasensitive to electromagnetic stimulation.
4. They form the dermal optic photoreceptor.
5. They form the animal magnetoreceptor.
6. They bind together photonic and magnetic data.
7. They operate in nanosecond time.
8. Their location in the blood, a fluid, and their exceptional pliability endow them with unusual flexibility.
9. They possess an extraordinary capacity for computation.
10. They hasten to the scene of activation in the brain.
11. They are present throughout the animal kingdom, including in species that lack a brain.
12. The cellular basis of consciousness is a profound problem that plausibly requires a profound solution, ideally delivered by a complete organ — in this case, the blood (we can disregard for the moment the distinction between the Red Blood Cells and the whole blood. It is possible that other elements in the blood play significant roles and that integrated solutions are provided by the whole blood; thus the theory could or should refer to the whole blood and not to the red blood cells alone, though they certainly appear to be the main actors).
13. This interpretation adheres to the principle of redundancy, whereby two or more organs fulfil the same function, allowing them to specialise, and complement each other.
14. This view adheres to the principle of multifunctionality of a given organ.

The Original Immune System

The Red Blood Cells conduct ultrasensitive monitoring for possible threats and can upon occasion respond with a chemiluminescent medicinal effect (termed the phosphorescence of wounds by Civil War surgeons who observed that soldiers whose wounds glowed in the dark were more likely to survive), like that sometimes triggered by Biophotonic Therapy.

It may be also true that certain "placebo" effects, are in fact physically executed via such chemiluminescence.

The articulation of different body organs and development of a closed circulatory system attenuated the leverage that this system could obtain over pathogens, while providing them a multiplicity of hiding places.

The evolutionary response was to develop the highly articulated system of cellular and humoral immunity. A fuller understanding of how the red blood cells behave may explain the extraordinary maneuverability of flying insects who have only 300 neurons, why benthic shrimp have prominent eyes when they live in pitch darkness: the hematocytes in their eyes may act as magnetoreceptors for navigation and the identification of food and predators.

The role of Red Blood Cells in eyes as magnetoreceptors deserves careful investigation.

It is in the eyes that the Red Blood Cells come closest to the surface and can achieve the highest degree of accuracy. The mysterious hemal system in echinoderms fits this pattern as well. Starfish may lack a brain; but they demonstrate a formidable capability for intelligent, coordinated action, including limb regeneration. In effect, one can speak of a Riddle of the Starfish: it is a creature with an organ that has no apparent function, and a function that has no apparent organ.

Conclusion

1. The unique characteristics of the Red Blood Cells differentiate them from other body cells, making them more prokaryotoid and fitting them for remarkable roles.

2. Russian Scientists found that the Red Blood Cells are the dermal-optic photoreceptor makes more sense than any other explanation, and it endows them with an extraordinary capability.

3. The 18 points matching the Red Blood Cells, with the animal magnetoreceptor, and the 14 points matching them with the cellular basis of consciousness, are too high numbers to be simple coincidences.

4. Red Blood Cells; possess decisive advantages over neurons, their main competitors, in terms of numbers, size, flexibility, and speed of processing and interaction.

Acting as a metacolony in real time, the Red Blood Cells form the dermal-optic photoreceptor, the animal magnetoreceptor, the conscious awareness system, the ultrasensitive Psi receptor, and the chemiluminescent Original Immune System.

They constitute the Original Intelligence of our distant oligocellular ancestors.”
- Kenneth J. Dillon, in “Theory of the Red Blood Cells”, 2021.

Chapter 14

Diseases Proceed Primarily From an Impure State of the Blood

> ***"Clear the Blood, and as the Pulse Tension is Reduced, its rate quickened, and the Urine Increased, the Mental Condition Alters as if by magic, ideas flash through the brain, Everything Is Remembered, Nothing is Forgotten, Exercise of Mind and Body is a Pleasure, the Struggle for Existence a Glory, Nothing is too good to happen, the Impossible Is Within Reach, and misfortunes slide like water off a duck's back (well-being). To such a terrible extent Are We the Creatures of the circulation in our brain."***
> *- Dr Alexander Haigh, MD, in "Uric Acid as a Factor in the Causation of Disease", 1896.*

"All diseases proceed primarily from an impure state of the blood.

Hence, cleanse the blood and you restore health!

It has been found that the chief, if not the only, important factor in the causation of disease is a morbid or poisoned condition of the blood." - in "The Bedrock of Health", 1906.

Toxicity of the Blood

> *"Bouchard has isolated 7 distinct poisons in the urine alone, and shows their action on living tissues.* ***He proves the Toxicity of the Blood itself in its capacity of carrier of the poisons to the various excretory organs."*** *- Dr. Thomas J. Orbinson, MD in "The American Journal of Medical Sciences", 1908.*

"Myofascitis is empirically diagnosed and treated under the following headings:

1. Lumbago.
2. Sacroiliac Strain.
3. Sacroiliac Relaxation.
4. Sciatica.
5. Arthritis.
6. Strain of Lumbar Muscles.
7. Rheumatism.
8. Tennis Elbow.
9. Glass Arm.
10. Charley Horse .
11. Contusion.

12. Low Back Pain.
13. Sciatic Scoliosis.
14. Bursitis.
15. Ruptured Muscle Fibers.
16. Toxic Wry Neck.
17. Neuritis or crick of shoulder or neck.
18. Flat feet, (particularly the juvenile type).

Because its local symptoms closely resemble those of the conditions just listed, it has successfully masqueraded under these diagnoses for years by concentrating the physician's **attention on these local or secondary manifestations,** usually deemed orthopedic in nature, **rather than upon the underlying cause: Toxicity of the Blood."** - Dr Fred H. Albee, MD, FACS, in "Myofascitis A Pathological Explanation of Many Apparently Dissimilar Conditions", American Journal of Surgery, January 1934.

Toxicity of the Blood in Influenza

"The general anergy which occurs in Influenza is expressed also in a reduction in the specific immunobiological indices: in patients with Influenza the Pirquet reaction, previously positive, becomes negative in 72% (Debrl, 1918)

As far as the distribution of the Influenza in the patient's body is concerned, this problem has been little studied.

However, the characteristics of the pathogenesis of Influenza indicate that the Bacillus enters the blood stream, and many Symptoms of Intoxication are apparently associated with this.

Recently, it has been established through the direct observations of Solov'yev, Zakstel'skaya and Tarusov (1950) **on patients with Influenza that in the acute stage of the disease the Blood possesses Pronounced Toxic Properties.**

The Toxic Properties of the Blood are most pronounced during the first 2 days of the disease, that is, at a time when the general toxic symptoms of the disease reach their greatest intensity.

The Reduction of these Manifestations proceeds in parallel with the Reduction in Toxic Properties of the Blood.

These observations were continued by Zakstel1skaya (1951, 1953), who, using the constriction test of Tarusov, investigated 124 Influenza patients during 1948/1949.

It was shown through these investigations that the Influenza (the specific Toxic Properties of the patients blood are associated with it), circulates in the blood for the first 4 or 5 days of the disease.

The pronounced Toxicity of the Blood on the 1st, and partly on the 2nd day of the disease, and its decrease on subsequent days are distinctly seen.

The strict correlation between the concentration of the Toxic Factor (that is, Virulence), in the blood and the height of the fever, attracts attention.

This correlation is distinctly expressed also in the comparison in the results of large-scale investigations shows **the Relationship Between Percentage of Febrile Patients and Percentage of Patients With Positive Toxic Test of Blood When Examined on Various Days of the Disease.**

The Role of Secondary Microflora in Influenza

The significance of Bacterial Infection in Influenza in people was studied in parallel with the experimental data presented above.

Drobyshevskaya, Ostrovskaya and Shishkina (1937) made careful investigations of the Microflora of the respiratory tract in patients with Influenza dynamically according to periods: the first 6 days of the disease, the second 6 days of the disease, and the period between the 13th and the 40th day (convalescence).

The Pfeiffer Bacillus was isolated during the first period in 90% of the patients; in the second period, in 58%; in the third period, in 34%, whereby in 42% of the cases virulent forms were isolated.

The corresponding findings of the Pneumococcus (the majority were type IV) amounted to 100% - 76% - 56%; of the Micrococcus Catarrhalis, 84% - 50% - 31%; of the Hemolytlc Streptococcus, 28% - 17% - l2%.

The quantitative characteristics of the Microflora isolated attract attention: the number of microbes plated out during the acute period exceeded their number during convalescence by 1,000 times.

Smorodlntsev, Gulamov and Drobyshevskly (1948) studied the dynamics of secondary Microflora in Influenza during 1936 and 1940.

The authors characterized the changes in the Microflora of the upper respiratory tract in Influenza as an intense mobilization of a broad series of conditionally pathogenic microbes during the first few days of the disease.

The cessation of the clinical signs, was accompanied by a considerable quantitative reduction or complete disappearance of the bacteria in the majority of patients.

The concentration of microbes in the upper respiratory tract changed markedly.

Thus, during the first 6 day period the average number of Pfeiffer Bacilli for the entire washing was equal to more than 10,000 microbial cells; of Pneumococci, about 1001 000.

At the beginning of the second 6 day period, their number decreased by 100-1,000 times, and after the 13th day only solitary cells were encountered throughout the material. Similar data were presented in the work of Subbotina (1954).

Glukhov (1949), on investigating Influenza in 1945 and 19461 found a Streptococcal antigen in 70.2% of the patients in the serum (during the period of convalescence).

The complications were produced in large part by the Streptococcus.

According to the data of Krivaya-Usherenko (195l), **in Influenza patients Staphylococci, Streptococci, Pneumococci and the Bacilli Influenzae are found most frequently in the throat; In addition, the Micrococci Catarrhalis, Diplobacteria of Friedlander and other microbes are found.**

No significant differences were observed in the species composition of these microbes in patients with Influenza and Acute Catarrhs.

None of the microbes was isolated from all of the patients; however, **the Staphylococci were most frequent and abundant.**

In complicated Influenza the number of microbes increased markedly, whereas in uncomplicated Influenza the increase in their number was slight and was not maintained long.

In the work of Zhdanov and co-authors (1953), who made a comparative study of the Bacterial Microflora in Influenza and Acute Catarrhs, data were obtained which were similar to the results of Smorodintsev's and his co-workers research.

The authors did not find any essential differences in the composition or quantitative relationships of bacteria isolated in patients with influenza and acute catarrhs. **The serological investigations - the agglutination reaction of bacteria isolated from the patients with their sera taken during the acute period and during the period of convalescence - showed a variegated picture.**

It was impossible to demonstrate any serological changes in the patients with respect to any of the most frequently isolated microbes (Staphylococci, Streptococci). **Here, it is fitting to analyse the influence of Cold Stimuli on the development of the Influenzal infection.**

Existing observations are of an empirical nature **and indicate that the Chilling Factor may aggravate the course of Influenza.**

More exact research pertains to **the effect of the Cold Factor on the development of infection produced by conditionally pathogenic microflora of the respiratory tract. We consider it possible to dwell briefly on these data, because: Secondary Infection Is Of Importance in the Pathogenesis of Influenza.**

The nature of the effect of the Cold Factor has been demonstrated by the investigations of Marshak, Koyranskiy, and Epshteyn.

Marshak and co-authors (1935, 1938), established the fact that chilling of localized areas of the skin produces both a local reflex reaction expressed in a constriction of the blood vessels and a change in the blood supply and corresponding vascular reactions and an increase in the secretion of the mucous membranes of the upper respiratory tract.

According to the data of Koyranskiy (1940, 1948), the Reflex Reaction to local chilling, Involves a Number of Organs and Systems.

Here, weak cold stimuli, particularly a replacement of one temperature routine by another, lead to the development of the most pronounced reactions.

Epshteyn and co-workers (1948), **made a detailed study of the effect of local chilling on the development of infection in the nasopharynx, infection produced conditionally pathogenic microflora.**

The introduction into the respiratory tract per se of Microflora isolated from the nasopharynx did not produce any kind of pathological reactions.

If the persons examined were exposed to local chilling, they developed catarrhal signs in the upper respiratory tract, chiefly mild.

The possibility of "toughening" people (make or become stronger or more resilient) to repeated episodes of chilling was shown, and the latter, in this case, were not accompanied any pathological signs.

Wildfuhr (1950) used a cold stimulus (inhalation of cold air into the mouth and chilling of the feet) on normal persons, and those predisposed to colds.

In those predisposed to colds, the alexin and opsonin content in the blood decreased sharply; in normal people a slight decrease was observed.

Critical Evaluation of Certain Views on the Pathogenesis of Influenza

As a conclusion it seems expedient to give a critical evaluation of certain views on the pathogenesis of influenza and to make the necessary generalizations.

Even in the old works of the Russian clinicians influenza was recorded as a general disease wherein general Intoxication of the body was most important, along with the local Inflammatory processes.

The main result of the local effect of the Influenza pathogen is a Necrosis of the Epithelium, and an Inflammation of the Mucous membrane of the respiratory tract in mild cases and a Necrotic Hemorrhagic Pneumonia in severe cases.

The general toxic effect of the influenza pathogen consists mainly of the involvement of the nervous system, cardiovascular system, and a suppression of the protective forces of the body.

If we do not dwell on the unimportant details, these are the kind of statements which are found in the works of Voskresenskiy (1827), Filatov (1883), Glinchikov (1922), Konchalovskiy (1927), Ivashentsov (1932), Rozenberg (1934) and other clinicians who studied influenza.

After the discovery of the influenza pathogens a tendency was outlined in the foreign literature toward considering the pathogenesis of influenza a purely local process. **The main factor determining the acuteness and seriousness of the initial signs of influenza is specifically the rapidity of spread of the infection along the epithelium of the respiratory tract.**

Typical "toxic" signs at the beginning of the disease, in his opinion, should be considered the result of absorption of products of diffuse and almost simultaneous necrosis of a large number of epithelial cells.

Therefore, according to Burnet, the entire situation lies in the necrosis of epithelium lining the respiratory tract, and in the quantity of decomposition products which enter the body from there.

With less necrosis less decomposition products are absorbed and the toxic state is less pronounced." - Viktor Mikhaĭlovich Zhdanov, F.G. Epshtein, V.D. Solov'ev, in "The Study of Influenza", Ucheniye O Grippe, 1960.

The Relationship of Toxaemia to Heart Disease

"Diphtheria

General Symptoms:

In moderate or severe cases there is usually initial fever, of very short duration, and sore throat; the latter, however, is not a commanding symptom.

In the severest cases evidences of profound blood poisoning (Toxemia) are discerned: pallor, soft and irregular pulse, general weakness and marked subjective consciousness of illness.

Vomiting, a rapid fall in the pulse and hemorrhagic manifestations are all of grave prognostic significance.

Evidences of toxic neuritis appear in a variable percentage of cases and are observed between the 6 day and the 6 or 7 week.

In order of frequency and time of appearance, paralyses of the palate, eye, pharynx and muscles of the trunk and limbs are observed.

The palate lesion is indicated by nasal voice and by regurgitation of fluids through the nose; that of the eye muscles by squint, failure of accommodation and, more rarely, drooping of the upper eyelid (ptosis); and that of the pharynx by difficulty in swallowing.

Causes of Death

Death may result in 4 different ways:

1. A primary massive Toxemia, which mainly affects the heart, may lead to death within 3 days;

2. A less profound Toxemia may lead to heart failure within the first 2 weeks;

3. Obstruction of breathing caused by membrane formation and edema of the upper respiratory tract; and

4. Extensive paralytic manifestations, e.g., diaphragmatic paralysis or inhalation pneumonia, that may be directly or indirectly responsible for many late deaths." - in "Encyclopaedia Britannica", Vol. 7, 1972.

Concerning Disease & The State of the Blood

"The cause of disease is not the disease, but the deviation from the normal, produced by any cause, is the pathological condition, and that is the disease.

The idea of an incurable disease is ridiculous.

That Consumption (tuberculosis) Is Incurable Is A Silly Hoax, Not Believed by Anyone Having an Average Share of Common Sense, or Learning.

Thousands of Autopsies prove that the subject at some period of his life had been affected with real Consumption, and had recovered, even from the late stages of the disease.

There Is No Incurable Disease, there is no disease from which complete recovery has not taken place without medical treatment whatever, and of course would often take place with adequate treatment. What kind of a tangle, or derangement, is possible in the organism that will give no indications, have no natural language of its own and no certain demands for relief?

There is no such a condition in all human pathology.

And when we say there is, and make a list of such diseases, we simply deceive ourselves and our people.

We trace symptoms singly to that which produces them.

We may take any one of these symptoms and trace it back to the closure of the pores of the skin.

Bronchial exudates, etc.; it is from a toxic condition of the blood; this is from retention by the skin.

Rheumatism, it is from toxic deposits in the tissues; these are from a circulation overloaded with the same, and this is from retention by the skin.

Neuralgia, it results from congestion and toxic irritation of a nerve; this from decompositions that recomposed toxic compounds in the blood retained by a closure of the dermal pores. The tendency to devitalization, ulceration, eruption and fetor point to the rapid formation of toxic compounds in the blood.

Glandular Derangement points to the same, and this indicates a source foreign to the body, and antagonistic to normal functional process.

Examination shows that a foreign factor actually exists in numbers proportionate to the gravity of the case.

The nervous condition; the irritation and general nervous derangement is in consequence of Toxins in the Blood of more virulence than are common to the body, and these indicate the source, as a foreign invader.

The character of the pulse; **the circulatory excitement indicates nervous irritation; this indicates the toxin that indicates the invader.**

The temperature indicates abnormal waste to be oxydized, and this indicates the microbe that makes the waste.

The symptom of eruptions; these show toxic deposits in the glands of the skin; these show the condition of the blood from which they are derived; this indicates the invader that makes it so.

The symptom of cough; this is the effort of the system to throw off irritating exudates in the lungs, the exudates are from decompositions in the blood, these are from an excess of nutrition in the blood and from systemic waste, this is in consequence of the cells not being able to take the nutriment and keep up tissue repair and stop abnormal waste, this is in consequence of nervous weakness and inability of the sympathetic to supply the cells with positive magnetic influence to enable them to attract the nutriment from the blood stream.

Irritation Is From Toxic Compounds In The Blood; and is well marked in the pulse.

Inflammation Is Also Well Marked, and Many Systemic Disorders, if not all, are perfectly distinct.

The Coating of the Tongue Means Decomposition in the Blood, and that means vastly more than stomach derangement.

It Means General Glandular Derangement, The Formation of Toxins from Products of Decomposition, and Deposits in the Tissues of the Mineral Matters Contained in the Substance Decomposed, or the Loading of Secretions with the Same. It may mean, under certain conditions, the formation of concretions (masses of mineral matter). If Epsom Bath, and a stimulant be indicated in the last stages of enervation, you can hardly repeat them too often.

The capacity of the patient to utilize them is the only limit.

In chronic conditions, when the patient is dying for a lack of cell salts in the blood, you should give bran buns [toasted rye and small amounts of red wine] as often as they can be utilized.

We have demonstrated many times the fact that all disease is produced by a deviation from the natural, normal requirements, and that these deviations are, so far as we are able to trace them: Retention, Invasion, Enervation, Trauma, Poison.

Any one, or more, of these prime causes may produce acute or chronic disease in a great variety of forms, as the conditions and circumstances may vary.

We have known a person to take cold; that produces the condition we term retention; then he poisoned himself with medicine; that adds another factor; the medicine was an anodyne, which lowered the nerve power and prevented natural reaction in its effort to throw off the retention, so it continued.

The blood became loaded with toxic compounds, which made the breath more offensive than the fumes from a still-house.

The peptic glands, as well as all the glands, drew their secretions from this toxic blood, the nerves in the stomach, as well as all the nerves in the body, were irritated and sickened, insatiable greed, anorexia, diarrhoea, constipation, inflammation, kidney troubles, heart disease, “appendicitis”, ulceration and a great many other symptoms appeared as time went on.

Finally the doctors pronounced it a chronic disease, and recovery impossible.

What makes the symptoms of a cold, unless it be the morbid matters, ptomaines, etc., retained in the blood? Then how does Epsom relieve a Cold?

Natural diagnosis finds that **the underlying conditions, the symptom producer in sclerosis is substantially the same as in rheumatism, gout, etc.**

The deposits in rheumatism and gout are a recomposition from what was once nutriment in the blood.

The deposits in Sclerosis are exactly the same, and from the same source.

Recompositions are from the products of decompositions.

Decompositions in the blood could not often take place unless the blood carried more than the cells could utilize, either carried more than a normal amount, or the cells could not, from some cause, take a normal amount, leaving an excess of nutriment in the blood to decompose.

In Bronchitis the nerve power is, below the normal, and requires to be raised.

The blood is toxic and requires to be cleansed, antidoted and the toxic source cut off. It may be excessive amount of nutriment in the diet, or excessive organic waste and breaking down of cells, etc.

A proper tonic, a stimulant, if necessary, to give the tonic effect.

The daily warm Epsom sponge Bath to put the skin in good order for the elimination of waste and to antidote Toxic Compounds in the blood.

Small doses of laxative syrup 3 to 6 times daily to antidote toxines in the alimentary canal. And the fact that rheumatism is more common at a more advanced age, and another fact, that hearty eaters of rich foods are the principal sufferers, and the further fact, that when the diet is properly arranged to carry no more nutriment into the blood than the cells will use in a natural way, an improvement invariably takes place without the aid of any drug.

Chronic Nervous Cough

Those who suffer with catarrh and asthma are subject to this kind of cough.

The force of the pulse is below normal, showing enervation.

The coughing spells come on at nearly regular intervals, and last a certain time and subside, indicating a nerve storm, or diathesis. **The secretions are scalding in character, showing that they contain very toxic matters; they affect the skin about the nose and mouth very painfully. The patient is prone to take cold every change of the weather, and even from going into the outdoor air from a warm room, and is extremely sensitive to drafts of air, etc... The toxic mucous secretions are a prominent symptom in sight, and traceable to decomposition in the blood, from the elements of which the toxins form, and appear in the glandular secretions, especially those of the mucous membrane. Mucous secretions more profuse than normal, indicate toxic elements in the blood that irritate the governing nerves of the glands to abnormal activity, same as pungent odours and dust and smoke, etc., may excite the nerves of the nasal cavity.**

These Irritating Elements May Be From 3 Sources:

1. From the decomposition of an excess of nutriment in the blood.

2. From the breaking down of tissues and abnormal tissue waste.

3. From bacteria, the decomposition caused by bacteria, of the blood, the cells, the nutriment in the blood and lymph, and by the decomposition of the bacteria themselves, for the life term of these minute organisms is very short in many cases, and generation after generation follows, and the decomposition must be very considerable. When the blood is loaded with the elements of decomposition, confined, warm and constantly in motion, with vital and electrical influences ever present, recomposition must take place.

The kidneys and other glands, especially the mucous glands, secrete great quantities of partially decomposed albumen, the nervous system shows the effect of toxic matters in the circulation, often the breath is loaded with their odours. The urine and sweat may be very offensive. If there is an abnormal decomposition in the blood, partly, if not principally, from an excess of ingested nutriment, cut the diet down to safe limits. This done, a marked improvement always follows, and this improvement is the best proof we have of the apparent fact that a considerable amount of the decomposition in the blood is from waste nutriment in the blood, and not entirely from cell waste.

Our most successful physicians cut the diet down, and so reduce the decomposition in the blood so that nature may have a possible chance to react.

Some do it empirically, not knowing any reason why.

The natural appetite becomes diseased by transgression.

The mother is prone to allow her children to eat too much of some dish particularly good and rich. She does not understand the difference between a stomach full of something rich and the same of other things low in nutrition, **and so she allows them to overload the blood, then the excess, over what the cells can take, decomposes and the elements set free are drawn together in new combinations, which are always more or less toxic**, because carbon is in all foods, if not the very base of food material.

These toxins, so formed [carried] in the Blood, Irritate the Nerves, causing the Contractions in the Muscles, which cause:

Colic, Fever, Pain and even Convulsions and Death.

Some toxin may land in a little ductless gland and a boil result, and even great carbuncles may form in the larger glands in the same way.

Also congestions and abscesses may form in any organ or part of the body.

The toxins may take the form of Uric Acid, and Urates and become stranded in the dense tissues of the joints and arteries.

The blood toxins vitiate the secretions, the secretions are no less poison than the blood from which they are drawn and nothing tastes good any more. The stomach secretions are bad, the liver secretions are worse, and all secretions become an addition of toxicity throughout the entire extent of the canal.

In hemorrhoids, and in all diseases of the rectum and colon, there seems to be an apathetic circulation, mainly a push and engorgement of stale blood, not the bright red circulation of vessels with active muscles and live nerves.

The nerves are numb with compression and poison and the muscles are inactive, and the consequences could all be foretold from the diet.

If the alimentary canal was 30 centimetres longer there would be so many diseases from the increased toxicity of the bowel secretions that all the diseases we now know of would be forgotten, as of small consequence.

There are many chronic diseases that result from overloading the blood.

We used to hear of overloading the stomach, and we never placed too much importance on it, **but the effects of overloading the blood are much more serious and less thought of.**

Certain glands elaborate certain acids.

The glands of the skin elaborate Acids and other compounds from the blood, either to facilitate excretion, or as matters of excretion.

5 deviations to which the symptoms of disease are constantly pointing, and to which all symptoms may be traced in a strictly scientific manner:

1. **Retention.**
2. **Invasion.**
3. **Enervation.**
4. **Trauma.**
5. **Poison.**

We have never observed a symptom in any disease condition, which when traced in a fair manner did not relate back to one of these symptom producing deviations.

There is Generally a:

1. Stiffness or Soreness of the Muscles;

Sometimes there is marked:

2. Fever (High Temperature); Pain; Sore Throat; Coated Tongue; Perversion of Taste; Loss of Smell; Constipation; Headache; Rheumatism; Renal excitement or Apathy; and General Toxemia.

All Changes are Caused by Chemical Decomposition and Recomposition in the Blood, hence the rapidity of the changes mark the rapidity of the pathological changes within. The Most Distressing Symptoms in Chronic Disease Arise from Toxins in the Blood. These Arise Mainly from Decompositions of Nutriment which the Cells were Unable to Assimilate, a small amount of Toxins arises from Decomposition of Waste Retained in the Blood. It is seldom, even when **waste** is excessive, that **it is the chief source of decomposition. In chronic disease the appetite is capricious, and the blood becomes overloaded with nutriment far in excess of the capacity of the cells to take under the prevailing circumstances and condition of the Enfeebled Nerve Power [Force]. All Chronic Disease will be Greatly Benefited by Proper Dietary Regulation, and many Advanced Cases Cannot be Cured Without It.**

Blood carries the Toxins that Cause the Symptoms of Disease.

A Microbe is not necessary to retention, enervation, trauma or poison.

Why do you not think about more practical questions, such as Chronic Constipation, etc...?" - Dr William Harvey Burgess, MD, in "Chronic Disease; the Natural Method of Diagnosis and Successful Treatment", 1907.

Chapter 15

Tooth Nutrition

“Because some Important Constituents which provide Nutrients Necessary to Good Tooth Structure Are Missing in the Soil of Northern Sweden, children are plagued with

Dental Caries, and Toothache.

Alfred Aslander from the Royal Institute of Technology, Division of Agriculture, Stockholm, recently presented this view as he reported research on “Dental Caries from the Nutritional Point of View.”

Aslander, believing that his own poor teeth resulted from phosphate starvation as a youth, began experimenting with his son born in 1938, by giving him small daily doses of CaHP04 (Phosphorus).

He reports that the child's teeth grew white and strong.

After 2 years, he replaced the phosphate with bone meal which from experiments with animals appeared to provide more suitable nutrition.

In addition to its bulk of phosphates, Bone Meal (a source of calcium, phosphorus, and trace elements), some or all of which may be essential tooth nutrients.

He has continued his studies with his own 3 children and others, and has shown that it is possible to prevent caries in children by a suitable form of tooth nutrition.

He believes that: Dental Caries will Only Attack Teeth That Are Undernourished. If the blood stream is lacking, or deficient in essential mineral nutrients, the structure of the tooth will be impaired; and the tooth will not endure the normal strains to which it is subjected.

Dental Caries will then inevitably appear.

Dr Aslander points out that:

1. Earlier generations had far better teeth than the present generation because they consumed rougher foods including bones, gristle, etc. from which they derived certain essential minerals. Today, this somewhat crude table-fare has been abandoned; and as a consequence, the mineral nutrition of the teeth has become deficient.

2. The Cariogenic properties of [Cane] Sugar, and other carbohydrates are not due to their fermentation into lactic acid, but to their lack of minerals essential for tooth nutrition. The same applies to a great extent to Mineral-Deficient [Refined] White-Wheat Flour. The greater the proportion of these and other Mineral-Poor Foods in the daily diet, the more the teeth will be starved of minerals; structure will be impaired and caries will appear.

3. The effect of fluorine on dental health has been elucidated. From the nutritional standpoint, it is one of several essential tooth nutrients. Accordingly, the addition of fluorine to the nutritional supply cannot bring about complete tooth nutrition unless it happens to be the only tooth nutrient lacking. If other tooth nutrients are missing, then the addition of fluorine provides only a partial improvement. Moreover, if the fluorine supply is excessive compared with the supply of other mineral tooth nutrients, unbalanced nutrition results.

Dr Aslander argues that fluoridation was proposed at a time when it was assumed that fluorine was the only element lacking for the establishment of dental health. Since we now know that at least 6 elements, probably more, are essential tooth nutrients, the very foundation on which fluoridation is based has been destroyed.

Dr Aslander concludes that by complete tooth nutrition, it is possible to grow teeth that are highly resistant or immune to dental caries.

For that reason, a purely inorganic mixture of suitable minerals should be tested.

Dental Caries will vanish when the complete tooth nutrition theory has been sufficiently tested and the method universally adopted.″ - in "European Scientific Notes", Office of Naval Research Branch Office, US Embassy London, 1962.

Dental Caries From Poor Food Choices

"In Sweden Dental Caries is omnipresent.

In 1942 only 1 individual per 1,000 was found to be free from Dental Caries among young men starting military training, and in the school-year 1957-1958, only 40 school children in Stockholm were found to have caries-free teeth among 52,352. Thus 99.99%% of the population suffer from Dental Caries.

In the summer of 1938 the writer was forced to ponder deeply on the problem of dental caries.

My wife was then going to have our first baby, and I was determined that that child should not suffer from dental caries.

Dental Caries in children appeared to be most probably a result of insufficient nutrition.

Common food is too poor in nutrients essential for the formation of strong and healthy teeth.

My investigations of the soils on the parental farm had shown them to be very poor in phosphates, and thus the home-produced food was also probably poor in phosphate.

The bulk of the teeth is made up of phosphates. My Poor Teeth could be a result of Phosphate Starvation. Hence, my child born in the late summer of 1938 was given small daily doses of CaHP04.

The teeth grew white and strong.

After 2 years the phosphate was replaced by bone meal.

During these 2 years, was engaged in extensive nutritional experiments with rabbits, guinea pigs and rats, which brought out some new aspects of nutritional problems.

Bone meal appeared to provide more suitable nutrition for the teeth than phosphate. In addition to its bulk of phosphates, bone meal contains a good many other elements, some or all of which may be essential tooth nutrients.

Results

The experiment on tooth nutrition with my children as human guinea pigs started in 1938. My children then 3 in number, were free from dental caries, while their playmates, living under similar conditions but not given bone meal, suffered badly from that disease.

Apparently it is possible to prevent dental caries in children by a suitable form of tooth nutrition, Åslander (1948).

Later on, a good many children have been reported free from dental caries as a result of the writer's bone-meal method.

A tooth is a living and independent individual.

It grows out of the mandible in about the same way as a plant grows out of the soil. The root of a plant anchors the plant in the soil and takes up a considerable number of mineral plant nutrients from the soil solution.

At present we know at least 12 such essential plant nutrients, all of which must be taken up in sufficient quantities if the plant is to grow normally.

If any one of them is lacking or present in too small amounts, then the plant will develop a deficiency disease. The vigour and health of the plant is wholly dependent upon a sufficient supply of all the nutrients needed.

Likewise, the root of a tooth anchors the tooth in the mandible and takes up from the blood stream several essential minerals, of which at least 6 are known, and the vigour and health of the tooth is wholly dependent upon a sufficiency of all the nutrients needed.

If one or more of the essential mineral nutrients are lacking or present in the blood stream in insufficient amounts then the structure of the tooth will be of poor quality, such as cannot endure the normal strains to which a tooth is subjected.

Dental Caries will inevitably appear.

Dental Caries will Attack Only Teeth that are Undernourished, Not Teeth that have Received Complete Tooth Nutrition.

Dental Caries is a deficiency disease.

Our forefathers had far better teeth than the present generation. My parents, born around 100 years ago, had as children perfect teeth.

Thus their tooth nutrition must have been faultless. They were bone-eaters, in those days the small Baltic herring was grilled crisp and eaten bones and all.

Moreover, it was eaten at least once daily.

The mineral nutrition of the teeth became deficient.

As a consequence children had very poor teeth.

The Cariogenic Properties of [cane] sugar and other carbohydrates are due not to their fermentation into lactic acid but to their lack of minerals essential for tooth nutrition.

White sugar is almost entirely deprived of all the healthy minerals of sugar cane or sugar beet.

The same applies to a great extent to white [refined] wheat flour.

The greater the proportion of these and other mineral-poor foodstuffs in the daily fare, the more the teeth will be starved of minerals, the poorer will be the structure of the teeth and the more rapidly will dental caries appear.

From the point of view of tooth nutrition it would be convenient to recommend mineral-rich foods such as fruit and vegetables, preferably eaten raw, so that all of the minerals are obtained, with the addition of small amounts of Salts of Iron, and Iodine. The prevention of dental caries should begin in the mother's womb and not in the dentist's chair." - Alfred Aslander, in "Dental Caries From the Nutritional Point of View", Royal Institute of Technology, Division of Agriculture, Sweden, 1961.

"Growing Healthy Teeth Is Very like Growing Healthy Plants.

In both cases a complete set of nutrients is necessary.

If a tooth receives a deficient nutrition during the period of growth, then deficiency diseases are bound to appear.

The structure of the teeth will be of such poor quality that the tooth cannot withstand the attacks of cariogenic agents; the structure will collapse, and dental caries sets in. If, on the other hand, a tooth develops under proper nutritional conditions, it will become highly resistant to or immune from dental caries.

Complete Tooth Nutrition

The essential tooth nutrients are, in the first place, the minerals that form the tooth structure and the agents that catalyze the formation of the structure (Aslander, 1958).

My bone meal method was worked out on the assumption that the most conspicuous fault of our common daily fare is its deficiency in tooth-forming minerals.

In order to supply a complete tooth nutrition, bone meal was chosen as a food supplement; analyses of the improved brand of bone meal used by the writer (Aslander, 1960) have shown that it contains all the tooth nutrients that up to date have been proved to be essential.

In addition, bone meal contains a number of [other] minerals that may in the future be found to be tooth nutrients.

The main rules for the bone meal method are as follows:

1. Tooth nutrition by bone meal [supplementation] should begin as soon as possible, preferably with the pregnant mother, at least during the second half of the pregnancy and during the months of breast-feeding. The daily dose should be 2 to 3 grams. (It is advisable to begin with small doses)

2. Bone meal should be given to the child as soon as the milk is supplemented by other foods. The initial dose should be almost microscopic; by allowing a slow increase, the daily dose should be about 1.5 to 2 grams at the age of 2.

3. The daily dose of about 2 grams must be given continuously until all the teeth are full grown; that is, up to the age of 20, and thereafter, preferably throughout life.

4. An improved brand of bone meal must be used. So far, only the brand used by the writer has given perfect results.

5. Dental care must be natural. If brushing is performed, then only a Very Soft Brush should be allowed. A hard toothbrush and toothpastes must be avoided.

This gentle dental care is based on the theory that the dental plaque is a protective structure that should not be destroyed.

The theory introduced by Stratfors (1950), to the effect that the dental plaque is harmful to the teeth because it harbors acid-forming bacteria, must be regarded as somewhat fantastic.

It is hardly likely that nature would form a harmful coating on the teeth.

Far more probable is the theory that the dental plaque is a protective structure.

Dental care should be gentle and aim only at removing food residues that will putrefy and thus produce foul breath.

When the rules above have been strictly observed, it has been proved by more than twenty years of experience that both the deciduous teeth and the permanent teeth will be completely free of dental caries." - Alfred Aslander, in "How the Facts Are Suppressed in Connection with Bone Meal", The Royal Institute of Technology, Stockholm, Sweden, 1964.

The Teeth As A Foci of Infection

"Hygiene can only be ensured by knowledge of certain elementary principles, one of the most important of which is: ***Antisepsis of the Mouth, Is The Gateway to Many Diseases."*** *- Dr Louis C. Barail, MD, DDS, in "Annales d'Hygiène Publique, Industrielle et Sociale", 1933.*

"I have been made happy by discovering that; I Have Only Added to the Observations of Other Physicians, in Pointing Out:

A Connection Between the Extraction of Decayed and Diseased Teeth, and the Cure of General Diseases.

Several cases of the efficacy of that remedy in relieving Headache and Vertigo are mentioned by Darwin. Dr Gater related that; Dr Pettit, a celebrated French Surgeon, had often Cured Intermitting Fevers, which had resisted the bark for months, and even years, by this prescription; and he quotes from his works 2 cases, the 1 of Consumption (Tuberculosis), the other of Vertigo, both of long continuance, which were suddenly Cured by the Extraction of 2 Decayed Teeth in the former, and of 2 supernumerary Teeth in the latter case.

"When we consider how often the Teeth, when decayed, are exposed to irritation from hot and cold drinks and aliments, from pressure by mastication, and from the cold air, and how intimate the connection of the mouth is with the whole system, I am disposed to believe they are often the unsuspected causes of general, and particularly of nervous diseases. When we add to the list of those diseases the morbid effects of the acrid and putrid matters which are sometimes discharged from caries teeth, or from ulcers in the gums created by them, also the influence which both have in preventing perfect mastication, and the connection of that animal function with good health, I cannot help thinking that our success in the treatment of all chronic diseases would be very much promoted, by directing our inquiries into the state of the teeth in sick people, and by advising their extraction in every case in which they are decayed.
It is not necessary that they should be attended with pain, in order to produce diseases, for splinters, tumours, and other irritants before mentioned, often bring on disease and death, when they give no pain, and are unsuspected as causes of them.
This translation of sensation and motion to parts remote from the place where impressions are made appears in many instances, and seems to depend upon an original law of the animal economy". " - Dr Benjamin Rush, MD in "Medical Inquiries and Observations", 1809.

Endodontic-Endotoxemia

"For more than 135 years there have been attempts to retain teeth whose nutrient canals have been destroyed by placing gutta-percha or other sealants within the canals.

Numerous innovative mechanical techniques have been developed over the years to render the canals sterile and uninhabitable for microorganisms.

Virtually all advertisements within the industry trade journals emphasize "mechanical obturation" and not the biochemical aspects of sterility of the canal system, or if the canals can be sterilized at all in the short or long term.

As reported recently, overemphasis on this aspect of simply filling the empty spaces within the root canal system and its importance has misled the field of endodontology. What is most critical, is that root canal teeth become nesting sites for microbes who, due to the loss of outward hydraulic pressure from within the body of the dental organ since the pulp no longer is living, migrate though the dentin into the peri-radicular tissues, thence into the circulatory system and other tissues.

In "Dental Clinics of North America", Vol. 18, No. 2, April 1974, Dr Kaare Langeland, DDS, reviewed "Root Canal Sealants and Pastes", in which states:

> ***"The fact that sealers and pastes will contact vital or disintegrating tissue connected with the general circulation allows for generalized distribution by blood and lymph. The resorbability of sealers and pastes has been abundantly demonstrated by gross radiographic evidence. There is, therefore, no doubt that material is transported away from the site where it was originally applied."***

What has been shown as of equal or more significant importance is the relative sterility of the intra-radicular-canal system. Current research shows that the significant presence of bacteria in the canal systems lead to the pathogenesis of "Apical Periodontitis" (AP), this condition (AP) is a chronic/acute inflammation of the tissue about the roots of root filled teeth also designated as "apical granuloma."

Equally significant in consideration for successful endodontic procedures is the presence of bacteria within the microtubules of the dentin itself.

These concerns were reported in lectures in Chicago, and other cities in the 1930's and 1940's. Infected dentine was demonstrated to be of great influence on the lack of success of root filled teeth by Dr Weston Price, DDS.

Recent studies show that dentine can be infected.

Systemic implications are obvious from more recent work showing that Apical Periodontitis, an inflammatory process around the apex of a tooth root, is primarily a sequel to microbial infection of the pulp space of teeth and is a remarkably widespread problem.

It is calculated that apical priodontitis is so prevalent that by the age of 50, 1 in 2 (50%) experience the disease.

By age 62 the statistic rises to 62%.

In the United States it is estimated that 420 Million teeth have received root filings, or in the common vernacular "root canalled."

On this basis the average number of root fillings is 2.2 per adult.

Readily it can be understood that the magnitude of the problem is not fully comprehended nor appreciated as to its impact upon the general health of the individuals with this condition. Inflammation has been described as a common reaction of the body to damage of its cells and vascularized tissues.

The discovered detailed process of inflammation has revealed its relationship to immune response as being one in the same fundamentally.

The 5 Symptoms of Inflammation:

1. Redness (rubor)
2. Swelling (tumour)
3. Heat (calor)
4. Pain (dolor)
5. Loss of Function (functio laesa)

In a recent work, a close correlation to periodontal pathology and Rheumatoid Arthritis was found. In 62.5% of a study population of 1,412 people with Rheumatoid Arthritis, had Advanced Periodontal Disease.

The authors went as far as stating there are certain pathogenic similarities between the two clinical entities.

> *"There has been an increase in the number of case reports published in the medical literature citing dental infection as an associated factor in several systemic illnesses including:*
> *1. Uveitis (iritis, inflammation redness inside the eye) [Sela & Sharav 1979];*
> *2. Intracranial Abscesses [Holin 1967, Henig 1978, Ingham 1978, Churton & Green 1980, Aldous 1987, Marks 1988, Saal 1988];*
> *3. Childhood Hemiplegia (paralysis affecting one side of the body) [Hamlyn 1978];*
> *4. Cerebral Infarction (death of brain tissue due to a lack of blood supply) [Syrjanen 1989];*
> *5. Bacteriospermia [Bieniek & Riedel 1993];*
> *6. Subfertility [Bieniek & Riedel 1993];*
> *7. Necrotizing Fasciitis (bacterial infection in the tissue under the fascia) [Gallia & Johnson 1981, Steel 1987, Stoykewych 1978];*
> *8. Mediastinitis (inflammation of the mediastinum, area in the chest between the lungs) (Hendler & Quinn 1978, Zachariades 1988, Musgrove & Malden 1989);*

> ***9. Fatal Endocarditis (infection of the heart's inner lining, can be fatal) [Kralovic et al. 1995];***
> ***10. Toxic Shock Syndrome [Egbert 1987, Navazesh 1994];***
> ***11. Septicemia (infection in the bloodstream by bacteria) [Lee 1984]."*** *- in "Root canal treatment and general health: a review of the literature" International Endodontic Journal, 2000.*

Infections in the mouth can develop into chronic localized infections or systemic infectious disabilities; conditions we refer to as disease or illness.

In the pathogenesis and evolution of glomerular nephropathies, these localized infections play an important role.

Renal patients appear to be subject to a variety of dental problems such as periodontal disease, narrowing of the pulp chamber, enamel abnormalities, premature tooth loss and xerostomia.

Renal difficulties also often arise after a specific stomatologic (oral) treatment of dental foci. The Dental Infection, can localize in the pulp of the dental organ (tooth), developing acute gangrenous pulpitis.

With the advent of "modern endodontics" in the early 1950s and the commercialization of the dental profession, dental schools taught and encouraged the retention of the dead dental organ's shell (root canalled teeth), leading to the "save the tooth at all cost" era of dentistry for about 50 years, until year 2000.

In May 2001 "Scientific American", reported on the oral systemic linkage of oral bacteria found in the plaques of atherosclerotic patients, patients with hardening of the arteries: Atherosclerosis.

In 72% of the patient samples it was found that bacteria only found in the mouth had made their way through the vascular system and included themselves within the matrix of the vascular plaques.

The level of CRP—C-Reactive Proteins; were in some cases extremely high and might be a marker for the risk of heart disease.

Implicated in these patients were those with acute and chronic periodontitis, an infected inflammatory condition of the roots and supporting structures of the teeth. Research on the oral systemic linkage to good and enduring health reveals the potential deleterious effects of "modern root canal therapy" and "implant dentistry."

Apical Periodontitis is fundamentally equivalent to periodontal disease, implant mucositicgranuloma (dental implant failure), and may be termed, in fact, foreign body tissue reactions; "Cleansing Phenomenon", the natural physiologic pushing out of dead and dying tissues from within the human body. With this in mind, one may be wise to avoid unclean foods, water, air, and medical procedures." - Dr Ronald S. Carlson, DDS, in "Endodontic-Endotoxemia: Our Current Dilemma", Syntro-Research, 17 November 2008.

"E. faecalis is associated with different forms of periradicular disease including primary endodontic infections and persistent infections. In the category of primary endodontic infections, E. faecalis is associated with asymptomatic chronic periradicular lesions significantly more often than with acute periradicular periodontitis or acute periradicular abscesses. E. faecalis is found in 4 to 40% of primary endodontic infections.

The frequency of E. faecalis found in persistent periradicular lesions has been shown to be much higher. Failed root canal treatment cases are 9 times more likely to contain E. faecalis than primary endodontic infections.

Studies investigating its occurrence in root-filled teeth with periradicular lesions have demonstrated a prevalence ranging from 24 to 77%

This finding can be explained by various survival and virulence factors possessed by E. faecalis, including its ability to compete with other microorganisms, invade dentinal tubules, and resist nutritional deprivation.

E. faecalis possesses several virulence factors, its ability to cause periradicular disease stems from its ability to survive the effects of root canal treatment, and persist as a pathogen in the root canals and dentinal tubules of teeth.

*Factors that may contribute to a **persistent periradicular infection after root canal treatment include intraradicular infection, extraradicular infection, foreign body reaction, and cysts containing cholesterol crystals."** - in "Enterococcus faecalis: Its Role in Root Canal Treatment Failure and Current Concepts in Retreatment", Journal of Endodontics, February 2006.*

Disease & Food Choices

Vitamins

"Vitamins are activators or catalysts, that is, substances needed in small amounts to speed the chemical changes of digestion and assimilation.

Minerals

Minerals are needed to make some of the vitamins effective as well as to form structures in our bodies. It has long been known that we need fairly large amounts of such common minerals as Calcium and Phosphorus because they are the chief elements of bone. We get these minerals from animals, fruits, and vegetables.

Enzymes

Enzymes are substances produced by living cells. They are present in most of our fresh foods and are important to the digestion of food. Because they are destroyed by heat, we should include some uncooked food with every meal.

Adulterated Foods

Present trends in Farming and Processing, have gradually brought about changes in the composition of our common foods to the extent that some of them are not fit to eat.

Many of them are tampered with to make them look better or keep longer, with little regard to the effect on health.

A recent agricultural text by Seiden and Pflanders discloses that already **25% of our manufactured foodstuffs contain "supplements, drugs, and growth stimulants."**

For example, the use of poisonous sprays on crops and farm animals, the "altering" of poultry and livestock by glandular and antibiotic treatment, the refining and doctoring of cereals, and the chemical preserving of meats, cheese spreads, and salad dressings, as well as other practices unknown 50 years ago, present us with new dangers.

It has even been proposed that we preserve our food with "atomic radiation."

No doubt there will be still other schemes to make food easier to store and handle, but more dangerous to health.

Good health is largely a matter of body chemistry, and body chemistry is largely a matter of diet.

> ***"Today germs are not our principal enemy. Our chief medical adversary is what I consider a disturbance of the inner balance of the constituents of our tissues, which are built from and maintained by necessary chemicals in the air we breathe, the water we drink, and the food we eat. Persons who are afflicted with "rheumatism" or "cancer", for example, are not the victims of germs but of altered chemistry.***
>
> ***For a generation we have worked on the concept that our cells are never static and that in time they must be replaced in varying degrees by the nutrients obtained from food.***
>
> ***More specifically, our working hypothesis has been that all disease is chemical and, when we know enough, chemically correctable.***
>
> ***Malnutrition or under-nutrition may be either the cause or the result of ignorance and poverty.***
>
> ***A large part of human disease is chemical rather than bacterial in origin, and in diseases of chemical origin the trouble may be either excess or deficiency.***
>
> ***Twelve case histories are here given to illustrate the fact that deficiency states resulting from poor diets are still important and sometimes puzzling.***
>
> ***Mental symptoms disappeared when a man was finally treated with nicotinic acid for a long-standing dermatitis which was pellagra.***
>
> ***A man of excessively frugal habits suffered from spells of increasing weakness; he was able to return to work after a series of hemorrhages led to the diagnosis of scurvy, which was remedied promptly by the oral administration of ascorbic acid.***

> ***In many cases, however, the deficiency is more complex; the effect on the patient is a general biological blight, and a spectacular response follows the administration of complex foodstuffs such as dry milk solids.***
>
> ***In some deficiencies anorexia and glossitis are prominent symptoms; breaking this vicious circle with folic acid in one case led to the appearance of a voracious appetite and the complete restoration of a patient who had been near death from severe macrocytic anaemia.***
>
> ***The body cells can recover to an amazing degree from these chemical upsets.***
>
> *The deficiency diseases bring crushing burdens and stark tragedies.*
>
> ***All severe disease processes affect the metabolism of the tissues and, therefore, the nutrition of the tissues."*** *- Dr. Tom Douglas Spies, MD, in "Some Recent Advances in Nutrition", Journal of the American Medical Association, 7 June 1958.*

It is clear that part of our problem is to eat good foods, and another part is to avoid bad ones.

This intelligent course will protect our bodies from chemical upsets.

From study, observation, and experience, here are some of the common foods that I recommend to avoid or at least to restrict.

Refined sugar is useless in repairing or building the body, and it is one cause of tooth decay.

Even if you have no teeth, it can upset your chemical balance, thus inviting certain diseases." - Prof. Dr Victor H. Sears, DDS, in "New Teeth for Old", 1959.

Faulty Nutrition: The Influence of Diet, Need for Investigation

> ***"Admission to public hospitals increase 126%; to mental hospitals 105%. There was no more important factor for those interested in the physical welfare of the people than nutrition and it was becoming increasingly apparent that the diet of the people right from birth needed investigation."*** *- Sir James Elliott in 1938.*

The Power of Food And Its Effects In The Human Body

> ***"Diet Is A Part of the Necessary Treatment of Disease. A proper amount of food containing the elements necessary for body building is required to maintain standard health. Overindulgence brings on overstimulation, enervation, impaired nutrition from lack of secretion, and impaired elimination, ending in toxaemia; an insufficient quantity causes enervation and disintegration from dysemia, lack of balanced blood supply."*** *- Dr John Tilden, MD*

> ***"I believe Nutritional medicine to be the Mandatory medicine of the Next Century.***
> ***It is extremely effective, particularly in the early stages of disease, where Modern Medicine fails miserably. Its preventive approach is a guaranteed benefit; and last but not least, it is economically effective."*** *- Dr Derrick Lonsdale, MD, in "Why I Left Orthodox Medicine", 2014.*

Relation of Diet to Sound Teeth

"If we consider the first requisite, that of sound teeth, we find that they are dependent to a great degree upon the structure of the enamel; the teeth, like all other parts of the human organism represent the food materials that nature has utilized in their formation.

Correct Dietetics must be considered the fundamental principle of sound teeth, and therefore, the primary requisite.

What do the cells require from the food supply for the formation of a dense enamel structure?

So perverted his normal food supply by refining processes that all civilised peoples must pay the heavy penalty of defective bodies from early childhood throughout adult life.

How can the body secure its 12 Mineral Elements essential for growth, or how can good teeth be built when all of our cereal foods, such as wheat, rice, corn and oats are subjected to the refining process, and robbed of more than 75% of these mineral salts?

How can the body secure its 12 Mineral Elements when our vegetables are first peeled, and then boiled in water which extracts the juices, and mineral salts and which is invariably poured down the sink?

The Physiological Balance of Natural Foods Is Destroyed In This Way, and their utilization in the body is rendered imperfect.

All natural foods are designed chemically to maintain the normal neutrality, or slight alkalinity of body secretions.

This perfect arrangement of acid and base-forming elements results in an alkaline residue when oxidized during body processes.

The Refined Foods Have Had Many of Their Alkaline Forming Elements Removed, and our daily diet, therefore, contains a majority of acid forming foods. An excess of these Refined Foods produces Acidosis; a condition which indicates that the tissues are unable to secure enough Base-Forming Elements to maintain their Normal Alkalinity. These Tissues are Lowered in Resistance, and are Most Susceptible to Infection. There is no doubt, that the Demineralized Cereals, and Refined Sugar, in addition to Ignorance in the preparation and cooking of vegetables, Is The Cause, not only of Caries, but of many other Physical Defects.

Prenatal Feeding

The growth and development of the embryo during this period is entirely dependent on the contents of the blood of the prospective mother.

The blood is dependent on what she eats, and this eating must not alone supply her own physiological balance, but there must be sufficient additional intake of the essential elements to form a perfect body for the child.

The Calcium and Phosphorous intake is of especial importance owing to the huge quantity necessary for the new body under formation.

Now modern diet is deficient in these mineral salts.

For example, the following foods which are in very common use: Meat, boiled potatoes, white bread, white sugar, white flour, polished white rice.

These are practically free from Vitamins, Calcium and Phosphorous.

They are indeed practically mineral free, and result in acid formation owing to the absence of any neutralising alkalis.

Under these dietetic conditions the mother blood has to struggle to maintain its integrity and to supply the insistent demand for the essential elements.

Sooner or later then the cells of the mother are called upon to supply the necessary elements, this undoubtedly happens but much to the detriment of her bones and teeth. The increased tendency to Caries during pregnancy is significant in this respect.

Is it any wonder then that we find the modern civilised mouth in such an appalling condition?

Good teeth cannot be produced without Calcium and phosphorous in physiological balance.

The crowns of the deciduous teeth are already formed when the baby is born, and the mother's diet is the deciding factor as to whether or not these teeth’s are dense and perfect in structure. During this period then we must see that natural foods in contra distinction to the modern refined foods are absolutely essential.

Modern refining consists in removing most or in many cases all of the vital natural properties, for example, entire wheat which is a natural cereal food appears after milling processes as white flour, and about 75% of its Mineral Salts are removed, including Calcium and Phosphorous.

A practically pure starch remains with a little protein. Refined and processed foods are also acid forming because the alkaline mineral elements are removed.

The result of this is a tendency to acidosis and a consequent lowering of resistance and susceptibility to infection.

These foods are also wholly or partly lacking in vitamins, e.g., vitamin B is removed from all refined grains and cereals.

Pasteurization of milk and butter destroys most of the vitamin content.

White flour, corn flour, polished rice, white sugar and lard are all vitamin free. These foods are not in physiological balance and cannot therefore be perfectly utilised by the tissues. Pasteurization undoubtedly destroys more than the antiscourbutic properties of milk. The process is so unnatural and the chemistry of the changes so involved that it is difficult as yet to determine the actual result. Several clinical facts should cause us to look upon the efficacy of pasteurized milk with skepticism. Calves fed upon it will die.

The liability to scurvy is well known. There is apparently a detrimental effect upon the activating agent for the deposition of calcium.

Medical investigators report that the X-ray as well as a large number of autopsies show that there are few infants who do not present symptoms of rickets to some degree. Rickets is a nutritional disease characterized by changes in the bone structure due to imperfect calcification, with subsequent deformity.

In addition to this, muscular weakness and nervous disturbances develop.

The same metabolic disturbance which prevents the perfect calcification of bones will prevent the perfect calcification of teeth and, conversely, the factor in normal blood which stimulates deposition of calcium in bones will stimulate deposition of calcium in teeth.

The Unnatural Dietary of Civilised Nations

In spite of the food in a perfect state, which Nature has designed for normal nutrition, growth and health, civilised man, in defiance of all natural laws, has perverted this normal Food Supply through:

1. Ignorance,
2. Greed or Commercialism;

And reaped a reward of malnutrition, with consequent diseases and defects.

Refined and Processed Foods are:

1. Wholly or partly robbed of the elements for building perfect tissues. For example, entire wheat which is a natural cereal food appears after milling processes as white flour. During the milling more than three-fourths of its mineral salts are removed, including calcium and phosphorus. An almost pure starch remains, with a little protein. The natural brown rice kernel, during the polishing process to produce white rice, is robbed of its salts in a like manner, and this is true of all the grains, as pearled barley, de-germinated corn meal, and refined rye.

2. Acid-forming, because the alkaline mineral elements are removed. An Excess of Refined Foods Produces Acidosis — a condition which indicates that the blood is unable to secure enough base-forming elements to maintain its normal neutrality or slight alkalinity. The result is lowered resistance and susceptibility to infection. Examples of modern foods which are acid-forming are all refined starchy grains, as white flour, white rice, tapioca, corn starch, white sugar, etc...

3. Wholly or partly lacking in vitamins. Vitamin B is removed with the germ of all refined grains and cereals. Much of the vitamin-content of normal milk and butter is destroyed in pasteurised milk, and pasteurised butter. All three vitamins are lacking in white flour, corn flour, polished rice, white sugar and lard.

4. Not in physiological balance and, therefore, cannot be perfectly utilized by the tissues. In all Nature's food supply no instance can be cited in which a given food is purified starch, purified sugar or protein.

Oral Sepsis

Very many pathological conditions; are in whole or part due to the absorption of toxins and organisms from the mucous surfaces, the most important of these being the Gastro-Intestinal Tract.

Now this infection of the alimentary canal may exist without oral sepsis, but as might be expected where oral sepsis is present the chances of infection are greatly increased.

Let us, therefore, consider for a moment the powers and methods of action of these bacteria which are able to cause so much damage throughout the whole body. In the first place they may be divided into two distinct groups, Pathogenic and Non-Pathogenic.

The latter are those bacteria which, although present in the body, do not, under normal conditions, cause disease. Pathogenic bacteria are those which under certain conditions will cause disease.

These conditions depend on the relation of the virulence of the organisms and the size of the dose, to the resistance of the tissues.

Bacteria in their growth produce poisonous substances known as toxins, and these circulate in the body fluids and are carried to distant parts of the body where they are capable of producing severe general symptoms and lesions and often a general systemic disturbance out of all proportion to the size of the inflamed area of origination. In the case of mouth infections there is every evidence that the organisms and their toxins gain their access to the blood stream and so to the different parts of the body either directly into proximal blood vessels or else via the lymphatics.

So much then for the bacteria in themselves and their possibilities, but they alone do not constitute oral sepsis.

The facilities for putrefaction and the consequent inflammation are also necessary, also it must be remembered that the greatest danger exists in cases where these processes are of a chronic and lasting nature.

In other words, it is the long and continuous absorption of these bacterial toxins that constitutes the greatest danger to the general body health.

Before enlarging on the involvements of oral sepsis I will sound a word of caution. Oral sepsis is by no means a primary cause of many of the diseases with which it is often associated. There are other equally likely sources of infection. But even where Oral Sepsis is not a primary cause it has nevertheless an influence on the course and termination of the disease, and so deserves our close attention. Another interesting point in this connection is the explanation as to why many cases of very severe oral sepsis apparently produce no lesions in other parts of the body.

Diseases Due to the Absorption of Septic Products into the Circulation

Chronic Rheumatism: Cold and damp may predispose, but oral sepsis is the prime cause in many cases.

Rheumatoid Arthritis: In these cases or cause toxæmia the presence of organisms in the joints is the In most cases toxic absorption seems to be the most likely cause, and, of course, septic foci in the mouth are the most likely source of toxic absorption.

The following may also arise in the same way:

Arterio-sclerosis; arteritis; phebitis; neuritis; neurasthenia; and acute Bright's disease.

Pernicious Anaemia

Oral Sepsis is an important Factor in the Production of this disease, as it causes through the action of the absorbed toxins, an injury to the red blood corpuscles.

Debility

This condition where the patient is below par without any visible lesion being observed, where the symptoms are lack of energy, general malnutrition, sallow, unhealthy appearance, and loss of appetite, is most commonly associated with Oral Sepsis, and clears up satisfactorily upon the removal of the offending source of infection.

Diseases Influenced by the Presence of Oral Sepsis

Tuberculosis - Oral sepsis in children especially must be regarded as predisposing to tuberculosis. We must remember that the lymph glands are the defence provided by nature against tuberculosis, so that when these are infected from septic inflammatory conditions of the mouth and their resisting capacity lowered they are unable to deal with tubercle infection in an efficient manner.

The result then is that the tubercle bacilli are able to get into the system and reach the respiratory and gastro-intestinal tracts, there to find a position of diminished resistance, where they can remain and flourish.

Oral Sepsis Connected With Cancer

This disease up to the present has managed to keep its cause and origin a secret from the most painstaking research workers.

We have, Sir Arbuthnot Lane's assurance that cancer never attacks a healthy organ or a healthy tissue, and the most common and most generally accepted idea is that cancer is a disordered growth of epithelium caused by various physical or chemical irritants, the most common being the toxins of organisms.

Dr F. St. J. Steadman, MD, produced significant clinical observations and good evidence, in "Oral Sepsis as a Predisposing Cause of Cancer", Proceedings of the Royal Society of Medicine, 1914, on how Oral Sepsis is a predisposing factor in the causation of certain types of cancer.

Thus, Oral Sepsis is Definitely Associated with Cancer, in other words, that: The primary damage to the tissue cells is caused by the toxins originating from Dental Sepsis. He examined 143 cases of Cancer, and found that the degree of sepsis present was represented by a control figure equal to 92.54% of the highest amount of sepsis possible.

In a control with 415 patients free from cancer the figure given was 49% of possible Sepsis.

These figures show that: There Is a Greater Degree of Oral Sepsis Present In Patients Suffering from Cancer, than in those free from this disease." - in "Solving the Problem of Preventive Dentistry", New York State Journal Of Medicine, 28 March 1924; "Preventive Dentistry for Dental Students", 1925; "Oral Conditions in Relation to General Health; Influence of Ailments on the Oral Cavity", The Mouth Mirror, March-December 1929.

Oral Sepsis A Major Factor in Cancer

"For some time past clinical observation, both by medical men and dental surgeons, has shown that Malignant Disease is liable to occur in parts of the body which have been the seat of long-standing Chronic Sepsis.

There is little doubt that in many cases a simple ulcer is present for some time, associated with sepsis, before malignant change occurs.

Very many other authors could be quoted, showing that it is well established that long-standing chronic inflammation in any part of the body is liable to be followed by malignant disease.

For instance, Mr Sampson Handley states:

> ***"The most important factor in the production of breast cancer appears to be chronic mastitis."***

It has come to be recognized that Chronic Sepsis (caries, rotten teeth, etc.) predisposes locally to Malignant Disease, up to the present time it has not been realized what a profound influence chronic septic conditions of the mouth may have upon the production of Cancer in more remote parts of the body. I am of opinion that Oral Sepsis is by far the commonest predisposing cause of Malignant Disease. I showed that; 85.1% to 86.5%, occurred in the Alimentary Canal, and its associated parts; i.e., those parts to which infection from the mouth can spread either by continuity of tissue, or along ducts or lymphatic vessels. If Oral Sepsis is the commonest Predisposing Cause of Cancer, these figures show exactly what we should expect; namely, that the great majority of cancers occur in those parts of the body most readily infected from the mouth.

I want to emphasize that nearly 92% of these patients suffering from Cancer had had Periodontal Disease for a great number of years.

The evidence for the statement that Oral Sepsis, may Produce a Chronic Gastritis, Is Overwhelming.

It is the almost daily experience of surgeons, physicians, and dental surgeons that: The Removal of Septic Teeth Will Frequently Cure a Chronic Dyspepsia.

> ***"The symptoms of chronic gastritis are essentially those of a chronic gastric dyspepsia, since that is the usual morbid state underlying the clinical complex known as chronic gastric indigestion, when that malady is not purely nervous in origin. It may become established as a sequence of acute gastritis, or may slowly develop without any definite commencement, as the result of obstructed portal circulation, of continued infection from Oral Sepsis, or in the course of Chronic Toxaemias, such as gout, chronic nephritis, etc."*** *- Sir W. H. Allchin, MD, in "Encyclopaedia Medica", Vol. 11, 1902.*

I do not for one moment overlook the other Modes of Conveyance of Infection; i.e., by the Blood-Stream, lymphatics, by contiguity, - nor the effect on the mucosae of the excretion of toxins developed elsewhere.

1. Over 86% of cases of Cancer occur in the Alimentary Tract, to which infection from the mouth is readily conveyed.

2. That long-standing Chronic Inflammation, in any part of the body, is known to Predispose to the Development of Malignant Disease.

3. That the great Majority of persons suffering from Cancer in the Alimentary Canal, have Advanced Periodontal Disease, which has been present very many years.

4. That this advanced periodontal disease, is not nearly so common in persons not suffering from cancer.

5. That it is well established, that the constant swallowing of pus can, and does in many cases, bring about chronic gastritis.

6. That the Majority of patients suffering from Cancer of the Stomach, have had Chronic Gastritis for many years, Prior to the Development of the much more Serious Disease." - Dr F. St. J. Steadman, MD, in **"Oral Sepsis as a Predisposing Cause of Cancer"**, Proceedings of the Royal Society of Medicine, 1914.

Disorders Instead of "Diseases"

"Abdominal Reflex Disorders: Influence Exerted by Disturbing Emotional States on the Autonomic Nervous System, and the Secondary Effects Thereof.

Frequency of Abdominal Disturbances, Particularly of the Digestive Type, Having a Neurotic Basis.

I employ the term "Disorders" instead of "Diseases"; advisedly because of the frequency with which complaints referred to the abdomen prove on investigation to be Functional or Reflex.

1. The arrangement of the somatic nervous system is especially adapted for localized accurate reflexes, whereas the visceral system is for more widespread diffuse effects.

2. Every Biologist and Physiologist, knows that: Balance Between Opposing Forces; In the Organism Is An Essential Of Its Existence.

3. This Is True of the: Endocrine Glands; And there is good reason to suspect that: Every Portion of the Whole Body; Influences Every Other Portion, Either For Good, or Ill.

4. Stimulation And Regulation: Are in some degree; A Function of All Tissue.

5. In no mechanism is this so plainly evident as in the Autonomic Functions, and they Exert a Profound Influence on the Welfare and Functional Good Health of the individual.

Understand The Way Reflex Abdominal Symptoms Come About

1. Before we shall be in a position to understand the way Reflex Abdominal Symptoms come about, we must take into account: Certain Important Peculiarities of the Reflex Arc, in the Abdomen.

2. The General Sensorimotor Nervous System: consists of parts of Neurons the Cells; of which lie-within the Brain, or Spinal Cord, and they respond to stimuli at once, the delay being measurable in small fractions of a second.

3. An important difference exists in the constitution of the autonomic apparatus.

4. This System is made up of Neurons reaching out from the Brain, or Spinal Cord, and they are Not Distributed Directly to the Viscera (internal organs and colon), But are Gathered Into Ganglia or "Transformers", which are believed to Modify the Impulses received from the Central Nervous System, and adapt them to the peculiar more slowly acting tissues Secreting Cells, and Visceral Muscles to which the postganglionic fibers are finally distributed.

By reason of this arrangement the response to stimuli is in the autonomic system slow, and diffuse, rather than rapid and local, the delay being measurable in seconds.

5. The Internal Organs Are Not Themselves Sensitive To Painful Stimuli, but They Can Cause Pain By Reflex Stimulation in the Central Nervous System of Nerves Supplying Other Tissues to which Parts the Pain Is Referred.

6. Another important consideration is that: The Ramifications of the Abdominal Network result in each Organ Influencing Reflexly Other Organs, and If The Reflex Action be Sufficiently Strong; Function May Become Perverted in the Organs so Affected.

As a result of these Nervous Reactions, and Interactions, it often comes about that long before any change can be detected in the structure of an organ reflex sensory and functional symptoms have been in evidence.

1. Chronic Heart Lesions.
2. Kidney Lesions.
3. Central Nervous Disease.
4. Tuberculosis.
5. Chronic Oral Infections.
6. Nasopharyngeal Infections.
7. Anemias.
8. Intestinal Parasites.
9. Hemorrhoids and Anal Fissure.
10. Kidney and Ureteral Stone.
11. Pelvic Infections.
12. Neoplasms.

And many other discoverable conditions (to say nothing of the habitus of the patient), enter into the proper evaluation of abdominal symptoms.

There is little doubt, that the:

1. **Anxieties.**
2. **Worries**
3. **Griefs.**
4. **Disappointments of complicated strenuous present-day existence.**

Are in some measure activating and setting in motion his autonomic safeguards. You are all familiar with Such Manifestations in these individuals as:

1. **Fatigue.**
2. **Backache.**
3. **Headache, with the Palpitation.**
4. **Cold Hands.**
5. **Rapid Pulse.**

Which of late has become known as "Neuro-Circulatory Asthenia", and especially common is: Nervous Dyspepsia with Spastic Constipation. Above all, Surgical Operations On Neurotics, and particularly on those displaying the asthenic habitus, Should Be Avoided unless absolutely necessary. Fortunately, thoughtful surgeons realizing this are more and more restricting their operations to definite organic lesions." - in "Abdominal Reflex Disorders", The Med. Clinics of North Amer., 1921.

Reflex Disorders of Dental Origin

"Reflex Disorders of Dental Origin: cover a wide field in both Sensory and Motor Disturbances Throughout the Body; Varying in latitude from pain referred from one tooth to a neighbouring tooth, to referred pain in a limb terminal, from slight twitching of near muscles, to pronounced Epileptiform Seizures, or Paralysis. Manifestations of Nervous Disturbance, Having Their Origin in Dental Diseases. There are features of some degree of constancy which have occupied the attention of nearly every dental practitioner. **These are the Reflex Disturbances arising from Diseases of the Pulp.**

Reflex Disorders

Reflex pains do occur in connection with Diseases of the Pericementum (periodontal membrane, the fibrous connective tissue layer covering the tooth's cementum), but by far the greatest number of cases are found associated with Diseases of the Pulp.

The reason for this is fully set forth by Professor G. V. Black, MD, DDS, in "Diseases of the Peridental Membrane", The American System of Dentistry", Vol.I, 1886. As pointed out by Dr Black, affections of the Iris (Eyes) have an almost constant point of reference to the brow, those of the hip-joint to the inside of the knee, and so on.

This same constancy is observed in connection with the vast majority of acute pulp-diseases; the pain, being rarely localized in the affected tooth (except in cases of acute and sthenic pulpitis), is referred to some point or points of the corresponding nerve-trunk of the same side.

The general rule being that the affections of the pulps of the lower teeth have pain reflected to some point of the course of the inferior maxillary nerve, frequently in the auriculotemporal branch.

Pulp-diseases of the upper teeth are most commonly attended by pain in some point of the superior maxillary nerve.

In connection with either, pain may be referred to the first branch of the 5th nerve; this latter reflection is to be regarded as the first of the remote references.

The next reference is to the ear, where not only sensory disturbances may be noted, but also those of special sense.

Next in point of frequency are affections of the eye.

While **many of these are clearly traceable to reflex disturbance of the ciliary ganglion, there are others in which the second cranial nerve is involved.**

That is to say, while pain is usually confined to the ramifications of the 5th nerve, it may be referred to other nerves whose function is then disturbed; to the 2nd, resulting in functional diseases of the retina; to the 3rd, 4th, 6th, and 7th, in which cases motor disturbances of the muscles about the eye, and head are noted; **to the 8th, producing disorders of hearing; to the 9th and 10th, when disorders of the tongue, pharynx, larynx, and other parts may be noted**, as recorded in dental literature.

The spinal nerves may be affected, resulting in painful diseases of distant parts: the uterus, a thumb, or even a toe.

In addition to these should be mentioned the functional disorders of the cerebrum itself, cases of which have been recorded.

In Chronic Diseases, notably in connection with chronic degenerative changes, Reflex Disorders are common; and vice versa in diagnosis; localized pains about the jaws point to the more acute diseases of the pulp; Distant Pains Arouse Suspicion of Chronic Diseases of the Organ.

The Dental Diseases to which such pains are traceable to 4 groups:

1. Reflex Disorders due to the irritation of the hypersensitivity of dentine.
2. Those associated with acute pulp-diseases.
3. Those arising during the progress of chronic pulp-diseases.
4. Reflex Disorders due to diseases of the pericementum.

While it is certain that **almost any of these dental causes may be associated with almost any extent of nervous transference, it is extremely probable that pains may be and often are ascribed to a dental source where their true origin lies in other organs. The Teeth May Be The Seat, as well as the Source of Reflex Pains.** This is notably true in patients who suffer from chronic malarial poisoning, from gout, and in some cases from secondary syphilis.

In the Gout cases, it is more than probable that **pathological conditions exist in and about the teeth, to which general dental pains are due.**

Dental Origin of a Distant Pain

Does the pain disappear promptly upon the correction of the dental disease without any other treatment?

The vast majority of localized pains about the head and face, are due to diseases of the eyes and teeth. Those of the eyes are most frequently located in the 1st division of the 5th nerve, and, as stated, those of the teeth in the 2nd and 3rd branches. **These rules are open to many exceptions, but serve as directing signs in the location of the causes of facial and cranial pains.**

The vast Majority of the Common Neuralgias, with defined painful areas about the Head, Are Due to one of these Dental Disorders.

Pain in front of the ear, in the ear, pain over or in the eye, with a disposition to press upon the eyeball, tender spots in the occipital region, or in most of the cases of pain at the points of nerve-emergence, **all point to a Reflex Disorder having a Dental Origin.**

The dentist should in Neuralgic Cases, Correct or Remove All Dental Disorders to which Reflex Neuralgias are attributable.

Reflex Cranial and other Neuralgias are also associated with diseases of the Pericementum (the periodontal, is the thin, fibrous connective tissue layer covering the tooth's cementum, anchoring it to the jawbone.

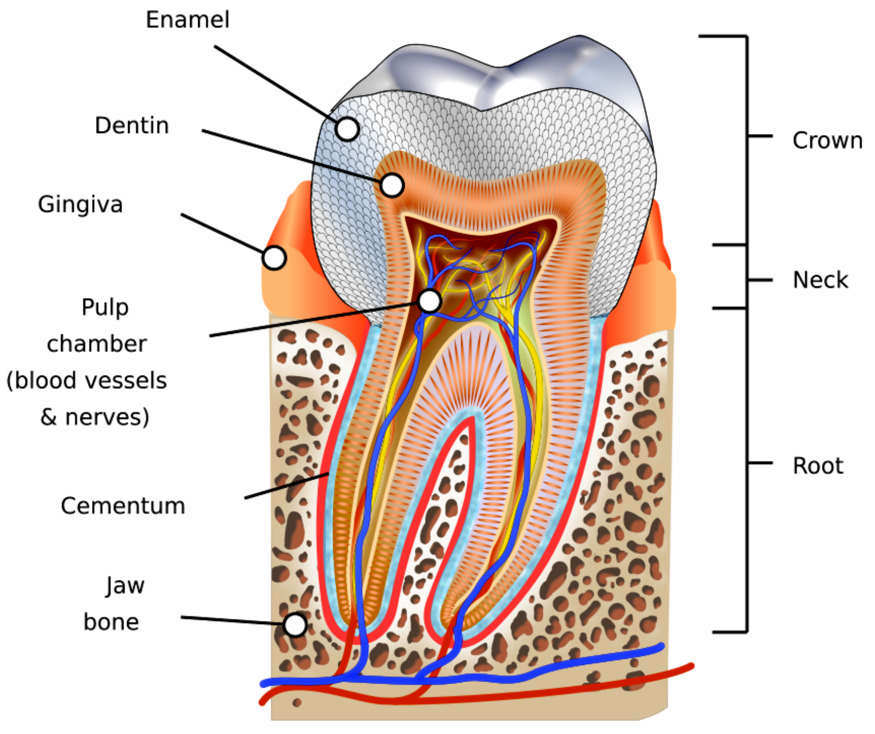
It is crucial for tooth support, nutrient transport, sensory feedback, and tissue maintenance); the classes of **pericemental affections giving rise to them are both Septic and Non-Septic.**

Many Reflex Neuralgias are Directly traceable to the existence of Septic Conditions about the Roots of Teeth, the proof of the casual association being brought to light by the disappearance of the reflex disturbance when the Septic Condition about the Root Is Remedied or the Tooth is Extracted." - Dr Henry H. Burchard, MD, DDS, in "The International Dental Journal", November, 1898.

Diseases of the Peridental Membrane

"The peridental membrane covers the root of the tooth, and serves to unite it with its alveolus.

I will describe the gingivae in connection with the diseases which have their beginnings in them.



Human Tooth
[Author: KDS4444, Wikipedia]

I will describe **the Gingivae In Connection with the Diseases which have their beginnings in them.** The blood-supply of the pulp of the tooth, and its peridental membrane is admitted to the apical space, usually, by a single arterial twig for each root. Just at the rim of the alveolus there is a pretty rich plexus formed by union with the arteries of the periosteum and of the gum: **the Gingival Plexus. The peridental membrane is the organ of touch of the tooth**; the enamel has no sense of touch. And the pulp is so encased within the hard structures of the tooth that it could not exercise the sense of touch if it possessed it. The teeth are normally well supplied with nerves and blood from at least two different sources, and that, though one of these sources of supply may be cut off, they seem not to suffer materially on that account — at least, this is the case with the peridental membrane. Now, the cementum of the tooth is supplied with nutrient material from the peridental membrane. It follows that the loss of some of the avenues by which this nutrient material may reach it will not materially impede its continued nutrition, and therefore will not materially lower its standard of health. This agrees substantially with what is seen in daily clinical experience. Teeth that have lost their pulps, go on decade after decade continuing in the most perfect health. The sense of touch remains perfect; the connection of the tooth with the neighbouring parts shows no signs of disturbance.

Diseases of the Peridental Membrane

One of the first things that the student should recognise in the study of the pathology of the peridental membrane is the fact that it is subject to various forms of disease. In the pathological processes of absorption the excitation is undoubtedly furnished by some local irritant which acts more or less continuously. In all cases that have come under my observation the tissues in the immediate neighbourhood of the destructive process have been found hyperaemic and presenting the macroscopic appearance of granulation-tissue.

The peridental membrane is the organ of touch of the tooth, and therefore definitely locates its ailments. The pulp of the tooth is not an organ of touch, and therefore does not definitely locate its ailments, but is especially prone to cause reflected pain, or pain referred to associate or distant parts.

This is characteristic of the diseases of those organs that have no nerves of touch, as is seen in pain referred to the knee in hip-joint disease, pain referred to the region of the scapula in disease of the liver, pain referred to the brow in inflammation of the iris, etc.

This peculiarity occurs so frequently in diseases of organs having no sense of touch as to make it a general law of symptomatology. Another point of prime importance is the fact that the dental pulp is especially sensitive to thermal changes, and that this sensibility is markedly increased in its diseases.

The Treatment of alveolar abscess in the vast majority of cases presents but little difficulty. **It consists in the simple cases in the removal of the irritant that has acted as the cause; i.e.; Septic Matter from the pulp-chamber of the affected tooth.** Constitutional treatment in the graver forms of acute alveolar abscess should not be overlooked nor neglected. The nature of the affection is not such that it can be cured by the internal administration of remedies, and that is in no wise the object of medication, but rather to limit the intensity of the inflammatory action on the one hand and to promote the healing process on the other.

It may also have for its object the mitigation of the pain. In very many of the cases that present themselves for treatment the inflammatory process will have reached its height — that is, it will begin to abate at once — on the discharge of the accumulation of pus; and in this case nothing can be done by the use of internal remedies to limit the extent of the inflammation. This has been an argument against the use of internal medication. But even in the cases stated internal medication may still save portions of bone from necrosis by the more ready reduction of the oedematous swelling and the quicker restoration of the normal circulation of the parts. **The duration of the inflammation is almost as important a factor in the production of necrosis as its intensity; therefore in all cases of considerable severity of the inflammatory process the local treatment should be supplemented with an active saline cathartic (purgative), as an aid in the speedy reduction of the oedema and induration of the parts, with the view of the quicker restoration of the normal circulation to the alveolar borders and such other tissues as may be endangered.**

This treatment will also contribute much to the comfort of the patient by reducing the duration and intensity of the suffering. I do not insist that the cathartic should be saline, but it should be such as will produce large watery stools and be prompt in its action.

Gingivitis

There is often some eversion of the gum, and the pockets thus formed are filled with the peculiar mucus-corpuseles, pus-corpuscles, and the usual micro-organisms of the mouth. This inflammation seems not to assume a destructive character. There is little or no separation of the tissues from the necks of the teeth, and the difficulty is usually transient, lasting but a few weeks. In those cases, however, where there is a disposition to accumulations of calculus or other irritating substances, it may serve as the starting-point of a more permanent local irritation; it therefore requires the attention of the dentist. **It will always be favourably modified by habits of cleanliness, and will soon pass away without other treatment; therefore the removal of the accumulations is usually all that is indicated. Of course the patient should be instructed in regard to the matter of keeping the parts well cared for. Some cases will be met with in which a brisk saline cathartic as an eliminant will be advisable, and this may be followed by the vegetable acids with advantage, or this purpose I have found nothing better than oranges or lemons; indeed, in all of this group of diseases these fruits seem to exert a very salutary effect. There is but little doubt that simple gingivitis is often the starting point of the more grave diseases of the peridental membranes.**

Calcic Inflammation

(inflammation resulting from the buildup of calcium crystals in soft tissues)

Calcic Inflammation of the Peridental Membrane and Gums:

I use the term Calcic Inflammation of the peridental membrane and gums to express that condition in which inflammation of these parts is caused and perpetuated by deposits of calculus on the necks of the teeth. This constitutional vice may be favoured by conditions of the teeth themselves, by their form, by irregularities in their arrangement, by the condition of the gums, as in the swollen state found in simple gingivitis, by vicious personal habits, such as want of cleanliness, and by the use of soft foods which require but little use of the teeth, etc. **Calcic Inflammation is really one of the most grave of the diseases of the teeth; not that it is so very difficult of management when rightly understood, but from the great number of cases that occur and its insidious character, by which it so often destroys the denture before the patient is aware of the danger. Within my observation it is causing the loss of more teeth than is caries. The subject, therefore, merits the closest possible attention."** - Professor G. V. Black, MD, DDS, in "Diseases of the Peridental Membrane", The American System of Dentistry", Vol.I, 1886.

Reflex Action as a Cause of Disease

"Reflex Action is the effect produced by an impression made upon a sensory nerve, transmitted by that nerve to a nerve-centre, and reflected or thrown back along a motor nerve. Another instance in which voluntary muscles are reflexly affected is seen in the acts of coughing and vomiting.

Coughing is adapted for the purpose of expelling irritating substances from the respiratory passages, and thus preventing their injuring the organism, just as the act of winking is adapted to remove injurious substances from the eye.

Coughing is usually excited by irritation of the nerves of that part of the body from which the irritant is to be removed.

An interesting case is described by Dr Teevan, MD, in the "Practitioner", October 1876, where a boy had been treated in vain by medicine, but was at once cured by healing a fistula in ano from which he had been suffering, the irritation produced by it appearing to have been the real cause of the incontinence.

We will now pass from **reflex changes in the respiratory and intestinal tracts, to reflex changes in the blood-vessels and heart.** It is well known that, usually, irritation of a sensory nerve causes dilatation of the vessels in the part supplied by that nerve, and contraction of the vessels in the other parts of the body.

This may take place without any alteration whatever in the beats of the heart itself; **but if the irritation be very strong, or applied to certain nerves, the heart also may be acted upon.**

There seem to be certain nerves which act more readily upon the heart than others, and more especially is this power possessed by the 5th nerve, the roots of which are very closely associated with those of the vagus.

The most important nerves through which the vessels are reflexly contracted are the Splanchnics (viscera the internal organs, primarily those in the Abdomen: stomach, intestines, liver, spleen), and the contraction of the abdominal vessels which they supply has much more effect in altering the general pressure of blood throughout the arterial system than the contraction of any other vascular district in the body.

But although the abdominal vessels are the chief ones concerned in alterations of blood-pressure, yet local alterations in the various organs may have an even more powerful action upon the nutrition of these organs themselves: for it is probable that although the abdominal vessels may be caused to contract by powerful stimulation of almost any sensory nerve, yet that the blood-vessels in different organs of the body, such as; the kidneys or mucous membranes, are more affected by irritation of some nerves than of others.

Congestion of the kidneys in horses is caused by exposure of the loins to rain, the action of cold upon that district of the general surface having a peculiar effect upon the kidneys, not produced by its application to other parts of the body." - Dr T. Lander. Brunton, MD, FRS, in "Reflex Action as a Cause of Disease and Means of Cure", Brain, July 1878.

Neurosis and Reflex Disorders

"The Circulation Is Closely Linked With the Emotions, not only the Heart but the Peripheral Vessels with their large muscular walls.

In Joyous Emotion we find the peripheral vessels dilated, the extremities warm, and the heart beating vigorously.

On the oposite, Dread and Anxiety contract the arterioles, the face is pallid and the hands are chill, the blood-pressure in the arteries is heightened and the renal secretion is profuse.

The Emotional State probably also affects the Cardiac Ganglia.

Some persons possess a power of voluntary control over these emotional disturbances of their vascular system, which is called coolness.

This power of voluntary control over the circulation exists in some persons to a very marked extent, even to the arrest of the heart's action.

The well-known case of Colonel Townsend, has often been alluded to by different writers. He possessed the power of arresting the action of his heart,'and at last killed himself by an exhibition of it. Disturbance of the heart's rhythm may also be induced by pressure on the vagus nerve.

The famous Czermak, of Prague, had a tumour in the neck lying over the vagus.

By pressing this tumour on the nerve, the heart's action could be slowed, or even arrested.

Neurosal palpitation of the heart may be: Primary or Reflex.

The reflex forms of palpitation are very common.

They are often due to uterine disturbance, and still more frequently to ovarian trouble; but they may be produced by some condition of the stomach, or of the intestinal canal.

In nerve disturbances the perturbation is not felt where it commences, but where it runs out.

The localised spots of pain connected with visceral derangement are well known.

In liver derangement, pain is often felt in the terminal cutaneous twigs of the acromial nerve at the point of the right shoulder, or in a twig of the sub-scapular nerve under the right shoulder-blade.

So in ovarian disturbance waves of nerve perturbation are set up which traverse various nerve fibrils, and cause different results according to the route pursued and the track taken.

If the wave passes to the stomach, we have dyspepsia (Ovarian Dyspepsia, "American Obstetrical Journal", 1 January 1878); if to the cardiac ganglia, we get palpitation: and both these maladies, to which women are so much more liable than men, are commonly reflex, and due to the condition of the ovaries.

Or it may travel to the respiratory centre and set up a neurosal cough.

At other times it passes out at the cutaneous terminations of the facial nerves, or of the intercostals, especially the 6th and 7th, where it is felt as a gust of neuralgic pain.

This is the explanation, in all probability, of the “pain under the heart,” so commonly complained of by women.

In reflex palpitation of the heart, it is essential for successful treatment to bear in mind its causal associations.” - Dr Milner Fothergill, MD, in “The Neurosal and Reflex Disorders of the Heart”, Brain, July 1878.

Clove Oil

Clove Oil: Provides temporary toothache relief by numbing nerves with its active ingredient (Eugenol), and reducing inflammation; use it by applying a tiny amount with your finger to the sore area, from the outside of the mouth, that is on your skin, not inside the mouth, as it is very unpleasant, pungent.

It contains Eugenol, which acts as a powerful, Natural Anesthetic to numb dental pain.

Side effects include gum irritation, burning, and stomach upset if swallowed.

It is crucial to see a dentist, as it doesn't fix the underlying problem, like decay or infection, but only masks the pain temporarily.

Chapter 16

Epilepsy

"Cases of Epilepsy it is said that by far the largest majority of the seizures are caused by the Grand Mal seizure, while approximately 25% are from Petit Mal attacks. Psycho-Motor attacks account for 18%, displaying different combinations." *- in "Migraine and Epilepsy", 2011.*

Each and every condition of Epilepsy, has at its base 1 of only 3 Factual Causation:

1. True Epilepsy (Grand Mal)

"The leading and pathognomonic features of true epilepsy are these: loss of consciousness and sensibility, most frequently accompanied by convulsions of the kind which I have described as epileptic, i.e. of movements which consist of alternate relaxations and contractions of muscles rapidly succeeding each other: these paroxysms occurring at intervals of variable length, with something of periodicity, the patient during the interval recovering himself completely. These phenomena are most frequently ushered in without any warning whatever, so that the patient is suddenly, and on the instant, seized, rendered senseless, more or less violently convulsed, and then awakes more or less suddenly. In many instances all this is done in scarcely as much time as it takes to describe the phenomena; at other times the fit is of much longer duration. 1. The sudden occurrence of complete loss of consciousness.
2. The sudden privation of voluntary and locomotive power, with more or less violent epileptiform convulsions. 3. And all this occurring at certain periods, with more or less uniform and regular intervals, during which the patient may, and frequently does, return to a condition perfectly normal." *- Dr R. B. Todd, MD, in "The Lumleian lectures", 1849.*

2. Colonic Epilepsy "Abdominal" (Petit Mal)

"The ancient name for many of the seizures of this group is epilepsy.
The second type of seizure is a headache possessed of certain characteristics.
The popular name is "sick headache; the medical term is "Migraine."
These 2 disorders are brought together for several reasons: First, they belong together."
- in "Science and seizures; new light on ***Epilepsy and Migraine****", 1941.*

***"Abdominal Epilepsy and Migraine."** - in "JAMA", 1973.*

3. Life is a Continuation (Psycho-Motor Epilepsy)

In Emunctology School the Emunctologist becomes fully aware, and it is Clinically Trained in each specific type of Epilepsy.
Then it is the responsibility of each Emunctologist; to correctly identify each type of Epilepsy in order to make the correct application of Therapeutics.
Epilepsy may be seen as one in its appearance of symptoms, but dependent on its origin of causation, the Protocols of Treatment become specific.
He who knowns how to Treat all Forms of Epilepsy, possess that understanding of how a physical body becomes afflicted, or is afflicted by so-called "Disease"; thus he is capable of Treating all Diseases of the flesh!
For Humans, are indeed: Spiritual Beings; having a Physical Experience.

All cases of Disturbances, and or Conditions, which have at their root cause in that, which is from the angle of; Life is a Continuation, such as all Psycho-Motor Epilepsy's, these are best, then, to be Treated by the Hospitallers Order of the Good News. For indeed, there are Karmic Forces, and there is also Material Cause and Effect, though Cause and Effect to many are the same as Karmic.

Yet, Karmic is that brought over, while cause and effect may exist in the one material experience only. The law of cause and effect is as the law of time and space; for cause and effect are one.

Thus the Emunctologist should indicate these cases to receive both Guidance & Treatments, to Only those who Seek.

Epilepsy And Its Treatment

"I express this opinion, moved as I am with the belief that; Epilepsy is not a disease of the brain. It has been the aim and the desire of pathologists to discover somewhere in the nervous system of the epileptic some abnormal condition, and thus account for the violence of the symptoms so characteristic of this condition. Quite naturally we have rested upon this theory until we are convinced, even in the absence of reliable data, that the disease is situated in the brain, but it does not follow that this must be so merely because the symptoms are of a cerebral origin, or of a Character Denoting Cerebral Irritation.

In support of this statement I would observe that the **symptoms of Epilepsy may depend upon, and be excited by, a Toxic Condition of the System, in a manner similar to the development of the convulsive seizures in so-called Uraemia.**

In the latter case it is known that the convulsion depends upon a form of Toxaemia, and not upon any pathological change in the brain or spinal cord.

The convulsions of children, which frequently announce the onset of an Acute Infectious Disease, are an example of the Effect of a Toxic Substance Upon a Susceptible Though Healthy Nervous System.

The same observation may apply with equal force to the convulsions of infants occurring during teething.

This theory of the Toxic Origin of Epilepsy is not new, for Robert Bentley Todd of England advocated the view in the year 1854.

In the light of our present knowledge, I am justified in holding, with some degree of confidence, to the Toxic Theory of the Origin of Epilepsy.

We have failed to recognize **the symptoms in these cases, usually prominent, indicating Disturbance of the Digestive Functions, and upon which the Disturbed Mental condition solely depends.**

These attacks may be preceded by retarded stomach digestion or abnormal intestinal digestion, though usually the latter condition prevails, and may be recognized by the ordinary symptoms denoting disturbance of the digestive functions. The attack is usually ushered in by the patient exhibiting for some time previously an abnormal, even ravenous, appetite.

There is the coated, frequently furrowed, tongue, the characteristic offensive epileptic breath, and a history of Constipation.

Convulsions may or may not precede or follow the appearance of these symptoms, but disturbance of the mental function is inevitable, and the attack continues until the exciting cause is removed, viz., Acute Intestinal Toxaemia.

It is pertinent to the subject to remark that the intestines play a vastly more important part in the digestion of food than does the stomach; and likewise disturbance of intestinal digestion results in proportionately graver consequences.

In disturbed stomach digestion food is quickly thrown off, affording, therefore, little opportunity for putrefactive changes to develop here.

On the contrary, in the intestines many conditions are present which tend to favour the development of putrefactive changes.

The question arises, What conditions tend to produce this derangement of the intestinal function?

As it would be inappropriate to enter here into a discussion of the subject, I would merely allude to one of these chief factors, viz., chronic catarrhal inflammation of the intestinal mucous membrane.

As Professor Charles Bouchard aptly expresses it:

> ***"Man is but a receptacle and a laboratory of poisons. The human body is the theatre of the toxic elaborations carried on by the normal microbes, which constantly inhabit the alimentary canal."*** *- in "Lectures on Auto-intoxication in Disease; Or, Self-poisoning of the Individual", 1894.*

Such is the hypothesis, I advance to Account for the Various Disturbed Mental States that are prone to complicate Epilepsy, and when Treating of its Therapeutics, we shall see upon what foundation it is based. In speaking of Epilepsy, uncomplicated by psychical phenomena, I wish to exclude all the traumatic and reflex disorders and refer only to Idiopathic Epilepsy, a point upon which I have but few remarks to make.

Idiopathic Epilepsy is characterized by the appearance of convulsive seizures, more or less severe, and occurring at irregular periods.

In the interval between the seizures the individual is in a comfortable and normal state, and, excluding a certain degree of dementia, **there appears not the slightest manifestation indicating disease of the brain, nor does the most careful examination, post mortem, discover any trace of abnormality.**

It is at least as reasonable, to attribute the convulsive seizures to the action of Toxic Substances Accumulating in the System, and at intervals exerting an Irritating Effect Upon the Brain.

I would offer the suggestion that, **in idiopathic Epilepsy some normal product of digestion, peptone for example, possibly gains access to the circulation through an unnatural channel, which, not being properly elaborated, acts as a toxic substance; or possibly the same result may come from the gradual accumulation of an albumin, globulin or toxic serum, allowed by some error in the elaboration of digestive products. Thus we may account for the presence of a substance in the system exhibiting Toxic Properties, which, however, does not develop as the result of putrefactive or fermentative changes in the intestinal canal. Evidently in certain cases of simple idiopathic Epilepsy we must concede that the disease does not develop from, nor is it dependent upon, the formation of Toxic Substances resulting from indigestion; for these patients appear to possess healthy and functionally normal digestive organs.**

Undoubtedly the tendency to the Epileptic condition rests primarily upon some peculiar instability or susceptibility of the nervous system, which possibly, in some instances, may be acquired, but probably in the majority of cases is inherited. Consequently the individual thus afflicted can offer but little resistance to the influence of Toxins.**The remarks above, referring to the important influence that the digestive functions exert over the Epileptic**, apply with a special force to those cases prone to attacks of psychical disturbance; for as I have explained this **complication in Epilepsy, whether it be an acute maniacal attack, the confusional state called "doubled consciousness", or the condition Status Epilepticus, all depends upon an Auto-Toxaemia, the result of retarded or disturbed digestion, especially intestinal, a complication that may be controlled by proper diet. Epileptics suffering from the psychical manifestations of the disease respond readily to treatment based upon the theory of the Toxic Origin of the attack.** It is observed, however, after removing the exciting cause by inducing thorough catharsis and withdrawing nourishment, that the symptoms of disturbance continue, unless all nourishment be withdrawn for a sufficient length of time to give needed rest to the digestive organs.

The termination of this period is announced when the patient begins to experience sensations of natural hunger.

Improvement then usually appears and all symptoms of the attack pass away within several days or a week.

A large clinical experience with this class of cases convinces me that the treatment above outlined is the only effective and rational one.

The Milk Diet Treatment for Epilepsy was adopted in the Buffalo State Hospital 5 years ago, and has been continued since with Eminently Successful Results.

The Majority of Epileptics Submitting to the Treatment Improve in a Marked Way: Both Mentally and Physically; and the Seizures Diminish in Frequency and Severity.

In many, though not in all, instances, patients who, previous to commitment, suffered from several seizures per week have, after the **Milk Diet Treatment, enjoyed immunity from attacks for periods varying from 1 to 8 months, and in isolated cases the attacks have apparently disappeared altogether.**

As above stated, the patient becomes, after submitting to this treatment, brighter, more active and very appreciative; for invariably he realizes that relief has come to him. Indeed it is frequently observed by our nurses that Epileptics who have once experienced relief from an enforced limited and special diet voluntarily, during an impending maniacal attack, submit to fasting.

The Diet should be Milk exclusively, and should be continued for several weeks.

It is well to follow the rule, that the amount of nourishment allowed must be governed by the condition of the digestive organs and not by the physical condition of the patient; and, in the event that symptoms of Toxaemia appear, to correct this, or rather allow the condition to correct itself.

It is worthy of remark that, notwithstanding the limited diet upon which these patients are maintained, they occasionally gain :flesh, in some instances going above the average weight, but more frequently the physical improvement is retarded until they are permitted to return to a regular diet.

The increase in weight occasionally observed in these isolated cases, notwithstanding they are maintained upon a limited diet, would seem to contradict ordinary experience and the laws of physiology, but the explanation is simple.

These patients, when treatment is commenced, are found to be in very poor physical condition; they have suffered long from the combined effects of the absorption of Toxines and the non-assimilation of the meagre amount of nourishment their deranged digestive organs were able to receive.

The system, upon being relieved of their influence of Toxines, inaugurated by a change of Diet, is able to perform assimilative processes; and the stomach and intestines, now no longer embarrassed by the presence of fermented and accumulating material, are able to work normally, and give forth normal products of digestion.

More frequently the effects of a limited diet give the results one would naturally expect, viz., loss in flesh, strength and activity and well marked anaemia; a condition, however, that need give little anxiety, as it is easily under control, the patient immediately responding to an increase in diet, when circumstances or safety appear to demand it.The importance of maintaining normal digestion during the Treatment of Epilepsy can not be overestimated, for in reality upon this depend the chances of benefiting the patient.

Constipation Should Be Immediately relieved by the exhibition of Cathartics, Laxatives or Enemata.

The habit of overfeeding the sick is an error too often committed, and I do not exaggerate when stating that the serious consequences following this practice are many times truly appalling. There is no denying that the anxious relatives, with perfectly good intentions of course, are often responsible for the serious consequences following this display of misdirected kindness. Even the attending physician is influenced by the belief that the body in disease is distressed for want of nourishment, and, to supply the supposed enormous waste produced by fever or disease, orders nourishment even when the patient expresses no desire for it, and not infrequently the victim is urged and forced to take nourishment when instinctively repelling the idea.

I have seen develop in Epilepsy, in Acute Mania, and Melancholia, rapid and Fatal Toxaemia, resulting from the injudicious administration of nourishment, when, in my opinion, recovery would have resulted under treatment based upon a properly regulated diet. I think it pertinent to remark here that the condition "Acute Toxaemia", referred to in the foregoing, is a frequent and often fatal complication of Acute Mental disease, and heretofore has appeared to us clothed in the indefinite term, "exhaustion."

I am not insensible of the importance of supplying nourishment to the sick, but I maintain that in attempting to force it, in cases prone to disturbance of the digestive function, especially intestinal, we defeat the very object sought; for the food that is forced in these cases but serves to add fuel to the fire, by supplying the alimentary canal with material that must undergo fermentation and putrefaction. In other words, the attempt to supply nourishment to the body when threatened with the absorption of poisons from the intestinal canal, is based upon a wrong conception of the operation of the digestive and nutritive processes.

The question of nutrition is not only subordinate to that of protecting the body against the invasion of fatal poison attacking from within, but it is doubtful if, in the condition alluded to, assimilation is possible.

I venture the assertion that Forced Feeding in Typhoid Fever is more Often Harmful, than beneficial.

In a few cases subjected to a Limited Diet, or allowed no nourishment, I have been gratified to observe, after all other procedures had failed, a prompt amelioration of the alarming symptoms and a fall in the temperature that previously had resisted all measures.

This observation is so completely in harmony with the views already expressed, that I can not refrain from presenting it, notwithstanding the treatment advised seems like, and **in fact is, reverting to the time-honoured though obsolete practice of "starving a fever."**

Undoubtedly some **advantage is to be derived from the use of the so-called Intestinal Antiseptics in those cases of Epilepsy exhibiting a tendency to periodic attacks of disturbance, or in fact in all cases presenting any of the psychical forms of the disease; for, as I have shown, these complications of Epilepsy Depend Upon the Absorption of Poisons from the Intestinal Canal.**

However, even under the most favourable circumstances, Intestinal Antiseptics can exert but feeble Antiseptic powers, when employed for the purpose of controlling fermentative changes in the intestinal contents.

Little can be accomplished, unless other measures are employed in conjunction with them, for we are able to use only small quantities of Intestinal Antiseptics.

It is certainly reasonable to assume that Antiseptics, when used in small quantities, produce but a partial effect when brought into contact with a quantity of confined material that is undergoing the changes of decomposition, for such is the condition encountered in the intestinal canal of subjects suffering from symptoms of Toxaemia.

The indications, therefore, for the relief of this, are:

1. To diminish the quantity of material in the intestinal canal;
2. To maintain the amount at the minimum;
3. To control the tendency to fermentative changes by the exhibition of Intestinal Antiseptics;
4. **The amount of material in the intestinal canal may be kept at a minimum by maintaining the patient on a Limited Diet, and by the administration of Cathartics and Enemata.**

Regular and Sufficient Exercise is of much assistance to Other Measures Employed in the Treatment of Epilepsy.

Much, however, depends upon the Environment of the Patient, his Inclinations, degree of intelligence and ability to **Carry Out Certain Instructions.**

In suitable cases where it is possible to do so, and when the recommendation would seem to promise favourable results, Regular and Sufficient Exercise should be Advised.

Chronic Idiopathic Epilepsy; we can ameliorate the symptoms by the enforcement of appropriate Moral and Hygienic Measures.

The ancients seem to have thoroughly understood the Important Influence Exerted Upon Epilepsy by Diet and Exercise.

The following, from Plutarch, referring to the well known case of Caesar bears in clear and concise language upon the point discussed, and the excellent description of the great Roman's personality also lends interest to the passage:

> ***"But they were astonished at his patience under toil, so far in all appearances above his bodily powers; for he was of slender make, fair, of delicate constitution and subject to violent headaches and epileptic fits. He had the first attack of the falling sickness at Corduba He did not, however, make these disorders a pretense for his infirmities, endeavouring to strengthen his constitution by long marches, by simple diet and by seldom coming under covert. Thus he contended with his distemper and fortified himself against these attacks."***

(Caesar went into South Spain as Quaestor in the year 68 B. C. He was therefore about 32 years old when seised with the attack at Corduba).

The following conclusions may be drawn:
